- Bacon, on the preservation of, 346.
- Bailey, Lewis, his inquiry relative to disease in poultry, 382.
- Balbee temple, enormous stones used in building, 368.
- Bailou, Adin, his queries relative to stone buildings, 270.
- Barberry bushes, inquiry respecting their being hurtful to wheat and rye, by H. C. 185.
- Barley, should be cut not when too green, but before it is fully ripe, 69—directions for its cultivation, 324—pearl as a substitute for rice, 410.
- Barn, built by Shakers, in Hancock, description of, 12—in Harvard, description of, 54.
- Bathing, rules for, 413.
- Beans, Lima, exhibited for premium, by Richard Ward, 54—on their cultivation, by J. Buel, 241.
- Beans, white, a soil proper for, 65—1009 raised from one planted, 70—810 raised from one, 134—new kinds of, 78—how harvested, 94, 115—Canada, recommended by Dr. Fiske 122.
- Bedsteads, directions for cleansing, 40.
- Beehouse or apiary of Mr. Putnam, 10—posts of, planted in water, 117.
- Bee moth, destroyed by using dry comb as a trap to catch them with, 70.
- Beer, receipts for making, 37, 261, 363—pea pods good in, 402.
- Bees swarming, notice of given by machinery, 5—driven by water from an old into a new hive, 9—how managed, by Jacob Shepard, 117—anecdote respecting their sagacity, 216—inquiry concerning, by Observer, 226—curious fact in economy of, 349—observations on, 397.
- Beet, large, 37—on the cultivation and uses of, 370.
- Bene plague, a specific against the summer complaint, 11, 225.
- Bennock, John, his letter, accompanying new varieties of potatoes, 145.
- Birds, their utility in destroying insects, 174—remarks on their wanton destruction, 312, 323, 352, 369, 392—destroyed by the severity of the season, 366; how scared from cherries, 403.
- Blackberry tea, a cure for dysentery, 64.
- Blight in pear trees, Judge Buel's remarks on, 121—Robert Canell's remarks on, 283.
- Blood horse, superior qualities of 317.
- Bog meadow, unproductive, how reclaimed, 325.
- Boiling apparatus, by Mr. Perkins, notice of, 349.
- Bone dust, as manure for grain, 412.
- Bones for manure, 402.
- Bono Publico, on the manufacture of silk, 121, 122.
- Boots and shoes, a recipe for making water proof, 175.
- Bostonians, remarks on their enterprise, industry, &c., 53.
- Bois in horses, Hadden's new theory of, 178—remarks on, by Mr. Capen, 186—by Dr. R. Green, 273.
- Boxwood recommended as a substitute for hops, 253.
- Bradley, Dan, on the destruction of thistles, 326.
- Bread from pumpkins, directions for making, 189—saline and other materials used in making, 272—newly baked, injurious to health, 378.
- Bremen geese, notices of, 358.
- Bridgman, T., his directions for making pumpkin bread, 189.
- Bronzing with metal, a recipe for, 301.
- Broom corn, extensive cultivation of, 70, 407.
- Bronson, Russel, his remarks on inadder, fruit trees, &c., 382.
- Brother Jonathan's advice to his son, 336.
- Browne, D. J., notices of his proposed work, to be called New England Sylva, 89, 342.
- Buckthorn for live fences, remarks on, 358.—See further fences live.
- Building, a query concerning, 35—on its effects on the stocks of fruit trees, 57, 67.
- Buel, Jesse, his remarks on the diseases of fruit trees in America, 9—on the okra, tomato, and egg plants, 44—on irrigation, 45—on underdraining, 35—on preserving potatoes, 94—on three thorned acacia, for live fences, 121—on using a boiler instead of a steamer in preparing food for swine, 124—on the Chinese mulberry's being killed by the winter, 121—on the blight in pear trees, and a remedy for, in chloride of lime, 121—on the culture of fruit trees in the Southern States, 170—on new sorts of fruits, 193—his tabular description of select pears, 209—on the culture and use of ruta baga, 220—on Lindley's remarks on fruit trees, 228—on making and preserving butter, 241—on the culture and use of horseradish, 241—on the Lima bean, 241—on the Love apple, 242—on dwarfing fruit trees, 265—on manures, 265—on cutting corn stalks, &c., 313—on an evening spent at his house, 320—on raising mulberry trees, 358—on alternate husbandry, 381.
- Bugbee, Charles, his great crop of Indian corn, 186.
- Buildings of stone, queries on, 370—answers to 298.
- Butler, Benjamin, his great crops of Indian corn, 153.
- Butter and cheese, premiums offered for, by Mass. Agr. Soc., 24—exhibition of, 166, 182.
- Butter, mode of packing and preserving, 65—quantity of, consumed annually in London, 139—deficiency in weight of, in Boston markets, 142—on making good, 291, 292—remarks on in a letter to R. Sullivan, Esq., 202—on using Liverpool salt for preserving, 211, 286—mode of improving, 294—how made at Judge Buel's, 320—bad in Illinois, 387.
- Buttons of John Hancock, 176.
- B. W. his remarks on leaves of the wild cherry, &c., 177.
- C. his remarks and queries relative to ice houses, 113—on destroying weeds with lime and sulphur, 100, 194—on the snapping of wood, while burning, 261.
- Cabbages, Mr. Townsend's mode of preserving through the winter, 281—modes of culture, &c., by the Editor, 353.
- Calcutta Botanic Garden, notices of, 125.
- Camellias, new kinds of, notices of, 51.
- Canada beans, recommended by Dr. O. Fiske, 122.
- Canada thistle, how to prevent the spread of, 2.
- Canker, in fruit trees, on the cause and cure of, 184.
- Canker worm, notices of its ascent in autumn, 133—how destroyed by smoke, 366.
- Canter, the pleasures of, 117.
- Cap of Good Hope, customs in, 150.

NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, AT NO. 52 NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE).—T. G. FESSENDEN, EDITOR.

VOL. X.

BOSTON, WEDNESDAY EVENING, JULY 20, 1831.

NO. 1.

CUTTING TIMBER TREES.

To the Editor of the New England Farmer.

DEAR SIR—I have read a communication in your paper of June 29, 1831, from Mr J. Alden, 2d, relating to some experiments which he has made in cutting timber trees to cause the stumps to produce sprouts or suckers. I observe in his communication that his trees were cut in winter, I have observed that most of our forest trees do not produce sprouts or suckers from stumps or roots if cut in winter;—but if cut when the sap is flowing, very few fail to send up a great supply of shoots either from the stumps or roots, or both;—and I have often heard farmers speak of chopping timber, for clearing off lands for farming purposes in winter, to prevent the stumps and roots from sprouting. I suggest these few hints for your own consideration, and you may, by examining the subject, be able to communicate something to your readers that will be of great use to such as want to use timber, and at the same time desire to secure a growth of young trees.

Yours respectfully, J. S. PALMER.
Peterboro', New York, July 12, 1831.

From the Genesee Farmer.

ON SHAPE OF TREES AND PRUNING.

Very few persons seem to be aware of the importance of giving proper form to the young tree, or mending or improving its shape, at a later period. In the peach it is ruinous, sooner or later, to encourage two or more leading and principal branches, from the main stem: let them grow ever so straight and upright, they constantly recede by the pressure of repellant branches, and by the weight of fruit; until, after having nursed them to maturity, on the first windy day, you have the mortification to find it split at the crotch, and one or both branches ruined, perhaps at the moment of the ripening of the fruit.

The peach is peculiarly liable to this misfortune, as the seam at the crotch adheres with less tenacity than any other tree cultivated.

The same doctrine holds good with the plum and nectarine, but with less force, and in fact, there is but one shape that is to be tolerated, with trees that are allowed their full growth, and not restrained, or trained in any way; and that form is a straight centre stem, from the root to the terminate bud, with branches alternately projecting at judicious distances, both around the circumference, and the whole line of ascent, allowing no one to gain the advantage of another in excess, but by proper retarding or encouragement, so to manage, as they shall present a cone, beautiful in shape, and strong to resist the wind, rains, and heavy weights of foliage and fruit.

Quince trees, by proper attention, may be made to have straight handsome bodies, and fine expanding regular tops, instead of the crooked, craggy, sprawling bushes, so generally cultivated.

It is also a great mistake to trim the stems of young trees too high, causing them to shoot up to premature heights, become top-heavy, and liable to be blown over, or badly leaned from their perpendicular and true position; which causes them to need staking, and tying, whereby they are apt to become chafed, and frequently ruined.

Trees in town gardens, which are situated between high houses and barns, are peculiarly liable to misfortune by wind, which is caused to whistle, whirl and eddy about with such force, as often to do great damage; in all such cases they should be allowed to send out limbs lower down, in regular order, with a straight centre, and handsome shape.

When peach trees get large and over-crown, or when they are apparently going backward from age, they can again be renewed by cutting off the whole top, at the collar next the roots, or at the first branching limbs, when a great quantity of shoots will put out and form handsome clumps, and bear well; indeed it is the Pennsylvania method of serving trees for the first bearing, which for seedling kinds do well; cultivated kinds should be cut above the graft. Prune all trees at the opening of the bud, and if you wish to be nice about it, cover the cut with grafter's wax, tar or oil paint.

THE MORTGAGED FARMS OF NEW ENGLAND.

The *last Christian Examiner* contains an excellent article entitled, 'The Morality of our Political Situation,' from which the following extract is made. It contains truths too notorious to be denied, and too solemn to be trifled with.

Here is a community, we are accustomed to say, free, flourishing and prosperous, beyond example; there never was a country in which all men from the highest to the lowest, from the richest to the poorest, could be more independent. And yet, if we were to travel over this same favored land, and were to inquire into its real condition; if, not satisfied with fine landscapes, and flourishing fields, and goodly dwellings, and the appearance of well clad citizens, we were to inquire into the state of property, and the degree of real independence and comfort that prevail, we should be astonished at the appalling amount and distressing burden of pecuniary obligation. We should find an almost incredible proportion of the community laboring under this load and pressure. Debt, universal debt, would meet us wherever we turned our eyes. The farmer owes the trader, the mechanic owes for the raw material; the trader owes the importer. In many districts, the country riders will testify that a considerable proportion of the debts contracted for what are considered the necessities of life, lie unpaid for two or three years,—yes, and they lie, in the shape of mortgages upon real estate. We have been in some of the most beautiful townships in New England, and have been amazed, on inquiry, to find that half of the farms in them were under mortgage!

Now, there are several causes to be assigned, doubtless, for this extraordinary state of things; but one distinct and prominent cause unquestionably is to be found in that state of political quality which we are considering. It creates a large unproductive class, in the female members of innumerable families in the country. The daughters of our substantial farmers, (as they are called) cannot go out to service; it would be a degradation, as they would deem it. Meanwhile the cheapness of the fabrics that are

sent out from our manufactories, has superseded the labors of the loom and the distaff. Spinning and knitting are obsolete toils. And the labors of only one or two can contribute anything to the support of the family. At the same time, this non-producing is by no means a non-consuming class,—as the bills of the merchant show, to say nothing of that grosser part of the account, which the granary and the cellar have to render.

It is perfectly evident that farmers, with moderate means, must go down under this burden. They do go down by thousands. And what is infinitely the most to be regretted, they go down in property. They lose heart and courage. The mortgage that has heavily upon their estates, lies heavily, as an incubus, upon their minds. They often sink under it, to indolence, vice and ruin.

From the Hampshire Gazette.

SHEEP AND WOOL.

The 'Bulletin des Sciences Agricoles' for July, 1827, contains a review of a German work on Sheep and Wool, by J. C. Ribbe, published at Prague, Bohemia; from which we have translated the following, save what is inclosed in brackets.

The author adopts the opinion of Linnæus that all the different kinds of sheep which exist are derived from a common stock, the *Ovis Argalis*, [for the wild sheep which inhabits the rocky mountains of Asia and Greece.] The largest species of sheep in Europe is the breed of Flanders, which the Dutch imported from India, about two centuries ago. The smallest race is that of Scotland. [M. Ribbe refers to the Hebridean sheep—a small breed, which weighs from 4 to 5 pounds per quarter when fat, and yield about one pound of wool of various colors. These small animals frequently carry 4 or 5 horns. This breed was imported into Scotland from Denmark at a very early period. There is now a race in Denmark which have four horns.] The national sheep of Hungary have, in both sexes, straight horns, from 12 to 15 inches long. The wool is 5 or 6 inches in length, and so coarse that it is fit for nothing but blankets.

Iceland has two sorts of sheep one large, the other small. Their wool is brown, and the inhabitants do not shear it, but pull it off—a most cruel operation.—The Icelanders make great use of sheep's milk. These animals live all the year exposed to the severity of the weather, and their principal food in winter is the moss, called Iceland moss which they obtain under the snow. The small species live among the steep rocks on the mountains, and sometimes a flock is carried over a precipice into a gulph by an avalanche, where they remain until the warmth of their bodies melts the snow which covers them and announces to their owners, by the steam which ascends, the place into which they have been carried.

About the year 1350, Peter, king of Castile, having been informed that there was a race of sheep in Barbary, which had precious fleece sent to several persons into Morocco to buy a great number of bucks. From this epoch commenced the reputation of the wool of Castile. In the 16th century, when Cardinal Ximenes was the Spanish min-

ister, complaints were made to him that the sheep of Castile had deteriorated. To remedy the evil, this minister determined to import a great number from Barbary; but as he could not obtain them by means of negotiation, he kindled a war, and invaded Morocco. The Spanish soldiers had orders to bring away as many sheep as they could; they pillaged the country, and returned to Spain with the precious plunder.

The principal breeds of Spain are those which the monks of the Escorial possess; those of the convent of Guadalupe, and of Paular; those of the duke d'Infantado, and of the counts of Negretti and Montara. The sheep of the Escorial have the most beautiful wool; those of Guadalupe are celebrated for their form and fleece; those of Paular have their head covered with wool, and their neck full of wrinkles; those of Infantado are born with coarse wool, which afterwards becomes very fine, and those of Negretti have a strong and robust body, with fine wool. All these races are called merinos, and were formerly the travelling flocks of Spain; since the late wars, they have become stationary. All the fine races of sheep now in Europe were derived from the merino of Spain.

In the Crimea, and some countries near the Caspian seas, they have sheep that bear when young short curled hair of a blue, brown, or black color, which is an object of commerce. That the wool may remain in small curls, the Tartars cover the lambs with a linen cloth sowed close around them, which is not taken off until the animal is killed. [These lambskins are celebrated, being damasked, as it were, by clothing the little animal.] In some of the vast forests of Russia, there are sheep which live in a wild state; these animals are so much affected by the sounds of drums and trumpets, that they begin to leap and dance, as soon as they hear them; and they continue these notions until overcome by excitement and fatigue, they are no longer able to flee from their enemies.

[The largest breed of sheep in the world is the fat-tailed variety; it is raised in central Asia, China, Persia, Africa, &c. The tail is a mass of fat, and often weighs 30 pounds. Another variety of Asia is the long-tailed breed, with coarse wool; its tail sometimes drags on the ground.

Europe did not possess any fine woolled sheep until the twelfth century. The Roman writers mention that fine wools and stuffs were imported from Spain, but this only proves that the Spanish sheep were better than those of the rest of Europe. In the twelfth century some African merchants sent to Cadiz a few sheep, the wool of which was remarkable for its fineness and whiteness. They were purchased by a Cadiz merchant, and placed on his country estate, where they succeeded, but he found no imitators.

From the Portsmouth Journal.

CURE FOR HYDROPHOBIA.

The following article was written at our request—as we conceive it to be the duty of every one who has in his possession a valuable secret, to let the world have the benefit of it in some way or other.

North Hampton, July 14, 1831.

Agreeably to your request, I have looked for the minutes I took several years ago of information given me by Dr BENJAMIN SANBORN, an aged and respectable physician, of Sanbornton, in this

State respecting his treatment of Hydrophobia, and his success.

The principal remedy was a strong decoction of *Lobelia*, given in frequent doses, till it operated as an emetic, and continued, but less frequently, afterward.

When first called to the patient, he administered immediately, while the lobelia was preparing, a powder composed, for an adult, of one grain of camphor, 1 of opium, 2 of digitalis, finely pulverized, and given in molasses. Half that quantity he would give to the smallest child.

In a case in which the disease was considerably advanced, he gave the powder once in thirty minutes, three times, and afterward, once in four hours.

If I recollect rightly, Dr Sanborn made the experiment with lobelia, first on swine. The swine of four families, in the borders of Sanbornton and Meredith, were bitten by a mad dog. The lobelia was given soon to the swine of three of the families, and not of the other. The animals to whom it was given all lived, and the others all died of hydrophobia.

Dr Sanborn was called to visit a son of Esq. Mooney, of Canterbury, about nine years old, who had been bitten by a mad dog. It was the eleventh day of his disease. He had become very wild, and could not drink. It was necessary to confine him, and, if I remember correctly, to pry open his mouth, in order to give the medicine.—What was first forced into his mouth was thrown out at his mouth and nose. Continual efforts were made with success. In about three hours he was able to sit at the table, and take tea with the family comfortably.

Dr Sanborn was called to visit Mr Noah Newell, of Reading, Mass. who was cured of hydrophobia, by the same method of treatment.

It is perhaps generally known, that lobelia is the plant which causes horses to snave so freely in the summer and autumn. It is very common in our pastures, and often found by the sides of our roads.

Yours, respectfully,
JONA. FRENCH.

GEORGIA WINE.

At the polite invitation of Col. Zachariah Williams, of Columbia county, we attended at the Globe Hotel, last evening, with some fifteen or twenty of his friends, of this and other counties of the State, to take some domestic wine, made by himself. It was of two kinds—made from the Madeira Grape and the Warren Grape—and with it, on the table was a bottle of wine, made from the Burgundy Grape, by Mr Aldum, of Georgetown, D. C. a gentleman distinguished for many able essays, laid before the public, on the culture of the Vine—and another of imported old Madeira, furnished by one of the first judges and importers in the city, and recommended as a first rate article. The general opinion of the company, who were nearly all good judges, was that the domestic wine made by Col. Williams, was very far superior to any domestic wine they had ever drank—either Mr Aldum's or Mr McCall's of this State, which several of them had drank, or any other—the Madeira particular, which was considered with suitable allowance for the difference of age, it being of last year's vintage, nearly equal, in body, flavor and color, to the imported, and by several, quite so. Indeed, it was so far superior to any domestic wine

they had tasted, that all were agreeably surprised and delighted.

We cannot too highly commend examples like these of a patriotic desire to improve the natural resources and wealth of the State; and the present one evinces in a striking degree, the great advantages to be derived from the culture of the Vine. Many have been discouraged by the belief that a first rate article could not be produced here—a belief proved by Col. Williams' Madeira, to be altogether erroneous. A great moral inducement to the culture of the Vine, is the fact that in all wine-making countries, where wine is the common drink, the people are uniformly temperate, as generally, healthy; and with the knowledge of these facts, the advocates of temperance may well wish success to the culture of the Vine as an excellent aid to the temperance Societies.—*Augusta Courier.*

Canada Thistle.—We caution our good farmers against treating this noxious weed with neglect. Attention to it during the months of July and August, will prevent their spreading at least, and will do much towards eradicating them where the ground is not under tillage. We have noticed several instances where they have sprung up in the highway, which have proved of serious consequence to the neighborhood in a few years after. In consequence of the highway's being considered every body's property, and not under the immediate superintendence of any one, only as regards the road, they have in such cases been allowed to spread themselves into the neighboring fields, to the great annoyance of the occupant, when a little time spent in cutting them each season would have prevented their increase; therefore, let every farmer make it his rule to see all the Canada thistles in his neighborhood cut at least three times in each season, whether they are in his fields or in the highway. You would not hesitate to shoot a wolf on your neighbor's premises; then do not cut a thistle, for he assured that thistles do more injury to agriculture in this state than panthers, wolves and wild-cats together.—*Gentee Farmer.*

HAMPTON COURT VINE.

There is at present growing in the Garden at Hampton Court, a grape vine of very large size, supposed to be nearly two hundred years old, and produces nearly one ton of grapes yearly. It is one of the largest in England, and is of that variety called the Black Hamburgh, and the branches extend about 75 feet. It is inclosed in a grape house, as these grapes seldom ripen well in that climate.—*ib.*

Preservation of Cabbages.—The London Monthly Magazine gives the following method by which the Portuguese preserve cabbages on board their ships. The cabbage is cut so as to leave about two inches or more of the stem attached to it; after which the pith is scooped out to about the depth of an inch, care being taken not to wound or bruise the rind by this operation. The cabbages then are suspended by means of a cord, tied round that portion of the stem next the cabbage, and fastened at regular intervals to a rope across the decks. That portion of the stem from which the pith is taken, being uppermost, is regularly filled with water during very long voyages. The same method might be advantageously adopted in private houses.

THE PLOUGH.

This instrument has held the first place among the implements of agriculture in all ages. Noah cultivated the vine and made wine immediately after the flood, but it is supposed that grain was first cultivated on the banks of the Nile, in Egypt. The invention of the plough must have been nearly coeval with the raising of grain. 'The first plough,' says Jahn, in his *Biblical Archaeology*, 'was nothing more than a stout limb of a tree from which projected another shortened and pointed limb. The further end of the longer branch was fastened to the yoke and a handle was added by which the plough might be guided.' Mr London says the plough originally used was of the pick kind, and he gives a figure of one on an ancient medal dug up at Syracuse, which resembles a pick-axe. The letter A (alpha) is supposed to have its shape from the plough in the most ancient form of the Greek A, one branch (the beam) is twice as long as the other (the share.) Another ancient plough figured by Mr. London is in the form of a sharp-toothed hook; the holder (a female) has one hand on the top of the beam, and a beam is inserted a little above the instep. The instrument now used for ploughing by the nations of the East, is similar to those of the ancients.

Mr London remarks, that the state of agriculture and other arts, and of machinery, in the eastern countries, was not materially different in the times of Moses, 3400 years ago, from what it is in the same countries at the present day. In Persia, the lower part of the plough is a long wedge-shaped thing, and the beam and handle are inserted to the top of this block; in some districts the driver stands on the wedge or shares. In Hindostan the ploughs are of the thick shape and are but little better than pointed sticks. The figures of some of them resemble the brush scythe of the American farmer, the blade being used for a share and the handle for a beam:—they are guided by a piece of wood attached to the beam near the share. The Hindoo ploughs merely scratch the earth, and to accomplish the work of pulverization, the ploughman repeats the operation from five to fifteen times. The Chinese ploughs are simple and some of them are drawn by women.

The ancient Greek plough, described by Hesiod, consisted of three parts—a long block sharpened at the point; a draught-pole attached obliquely to the upper part of the block, and extending to the yoke, and plough tail to direct the implement, fastened in like manner and extending back. A plough of a similar construction is now used in Sicily. The plough of the modern Greeks has a crooked share shaped like the claw of an anchor; it is only a continuation of the sloping handle, which is large and strong. The most ancient plough used by the Romans was of the simplest form. In the days of Virgil, this implement had become more complicated and efficient. They had ploughs with and without mould-boards; with and without coulters; with and without wheels; with broad and narrow pointed shares. The beam was fastened to the yoke, like our cart-pole. The Romans did not plough their lands in beds or ridges, as we do, but the cattle always return in the same furrow. The plough commonly used had no mould-board, and this may be remarked of the ploughs of most ancient, and some modern nations.—*Hamp. Gaz.*

From Lorain's Husbandry.

SMUT, OR FUNGUS ON EARS OF INDIAN CORN.

If this plant be wounded by injudicious cultivation, or in any other way, the sap commonly exudes from the wound, and it very often happens that a fungus is formed in and grows out of the part affected, and becomes very large.

The size of the wound increases with the growth of the fungus, and the stalk is corroded as far as the fungus becomes attached to it. I have often removed them, both before and after they had become very large. In some instances this has prevented the injury that is too commonly done by them. But, in general they quickly grow out again, and eventually injure or destroy the fruitfulness of the plant. However, I have never known extensive injury done by the fungus to a crop of maize; and but little of it would appear, if the plants were not wounded by an inconsiderate cultivation.

MANURE.

Farmers might make a valuable addition to their farm yard manure, by digging a hole at a convenient distance from their kitchen, about three or four feet deep, and sufficiently wide to form a common receptacle for the various matters originating in, and about the house, extending a paved gutter from the kitchen to it, to conduct soap suds and other useless slops into it. When it becomes offensive, the offending matter should be covered with earth. That which was thrown up in digging the hole may be applied so long as it lasts. Care should be taken to prevent the water from without from running into it. The receptacle may be hid from sight, by planting an evergreen hedge around it, leaving an opening at the back for putting in and taking out the contents.

From the Boston Gazette.

COCKROACHES.

An alarm has been sounded in various newspapers from different parts of the country, summoning the liege citizens of New England to unite their efforts for the suppression of *Cockroaches*. The locust plague of Egypt, it is supposed, would not be more terrible than the unchecked inroads of these creatures, which are said to be more numerous during the present season, than at any previous point of time. We are happy to be able to announce the discovery of a method of destroying these intruders, at once simple and effective. It is as follows:—Procure from the apothecary or herb woman, a moderate quantity of that odoriferous vegetable called Poke Root, and boil it in water until the juices are extracted, and mingle the liquid with good West India molasses, or if the spirit of patriotism be extravagant, with molasses from New Orleans; spread the liquid in large platters or soup plates, in the kitchen, pantry closet, or wash house, or whatever apartment may have been the subject of invasion, and the enemy will be found slain in heaps, lying by hundreds and fifties, before the following morning.

A gentleman to whom we are indebted for this information, states that he slaughtered 575 cockroaches in a single night, by means of the *Poke Root* and *Molasses*, and that the root which had been boiled being thrown into a closet, thickly infested by the enemy, the place was quit entirely in a few days, great numbers being left dead upon the floor.

Effects of Inertia.—The following practical and familiar illustrations of the general law of inertia are from the excellent treatise on Mechanics, by Doctor Lardner and Captain Haler, recently re-published.

'If a carriage, a horse, or a boat, moving with speed, be suddenly retarded or stopped, by any cause which does not at the same time affect passengers, riders, or any loose bodies which are carried, they will be precipitated in the direction of the motion;—because, by reason of their inertia they persevere in the motion which they shared in common with that which transported them, and are not deprived of motion from the same cause.

If a passenger leap from a carriage in rapid motion, he will fall in the direction in which the carriage is moving at the moment his feet meet the ground; because his body, on quitting the vehicle, retains by its inertia, the motion which it had in common with it. When he reaches the ground, this motion is destroyed by the resistance of the ground to his feet, but is retained in the upper and heavier part of the body; so that the same effect is produced as if the feet had been tripped.

When a carriage is once put in motion with a determinate speed on a level road, the only force necessary to sustain the motion is that which is sufficient to overcome the friction of the road; but at starting, a greater expenditure of force is necessary inasmuch as not only the friction is to be overcome, but the force which the vehicle is intended to move must be communicated to it. Hence we see that horses make a much greater exertion at starting than subsequently, when the carriage is in motion; and we may also infer the inexpediency of attempting to start at full speed, especially with heavy carriages.

Coursing owes all its interest to the instinctive consciousness of the nature of inertia which seems to govern the motions of the hare. The greyhound is a comparatively heavy body moving at the same or greater speed of pursuit. The hare *doubles*, that is, suddenly changes the direction of her course, and turns back at an oblique angle with the direction in which she had been running. The greyhound, unable to resist the tendency of its body to persevere in the rapid motion it had acquired, is urged forward many yards before it is able to check its speed, and return to the pursuit. Meanwhile the hare is gaining ground in the other direction, so that the animals are at a very considerable distance asunder when the pursuit is recommenced. In this way a hare, though much less fleet than a greyhound, will often escape it.

In racing, the horses shoot far beyond the winning post before their course can be arrested.

The Magnolia.—A covered wagon richly loaded with branches of the Magnolia Glauca, or Beaver tree, as it is sometimes called, made its appearance in State street, 2d inst. The driver took a stand opposite an Insurance Office, and in a few minutes was surrounded with purchasers who bought liberally at the moderate price of 6¢ cents for each flower. They were brought from Gloucester, Cape Ann, at a sheltered swamp in which place they grow abundantly. Speculations of this nature are very rare, and we are happy to learn that the enterprising man who brought them to the city was well paid for his labor.

The Magnolia Glauca is the only species of this superb genus that has ever been found in our climate. It attains (says Bigelow) the height of a dozen feet, but is sometimes killed down to the roots in severe winters. The bark is highly aromatic, and possesses medicinal qualities. The flowers shed a strong but fragrant perfume.—*Boston Transcript.*

To preserve Cucumber plants from bugs and flies.—Break off the stalks of onions which have been set out in the spring and stick down five or six of them in each hill of cucumbers and the bug will immediately leave them. It would be well after a few days to renew them, but one application has frequently been found to be effectual. The common chives or sives, will have the same effect with the onion.

ON THE HORSE AND OX.

By President Madison.

I cannot but consider it as an error in our husbandry, that even are too little used in place of horses.

Every fair comparison of the expense of the two animals, favors a preference of the ox. But, the circumstance particularly recommending him, is that he can be supported when at work, by grass and hay; while the horse requires grain, and much of it; and the grain generally given him is Indian corn, the crop which requires most labor, and greatly exhausts the land.

From the best estimate I have been enabled to form, more than one half of the corn crop is consumed by horses, including the unground ones; and not less than one half, by other than pleasure horses. By getting free from this consumption, one half of the labor and of the wear of the land would be saved, or rather more than one half. For on most farms, one half of the crop of corn grows on not more than two fifths, and sometimes a smaller proportion of the cultivated fields; and the more fertile fields would of course be retained for cultivation. Every one can figure to himself the ease and convenience of a revolution, which would so much reduce the extent of his cornfields; and substitute for the labor bestowed on them, the more easy task of providing pasture and hay.

But will not the ox himself, when kept at labor, require grain food as well as the horse? Certainly much less, if any. Judging from my own observation I should say, that a plenty of good grass or good hay, will suffice without grain, where the labor is neither constant nor severe. But I feel entire confidence in saying, that a double set of oxen alternately at work, and therefore half the time at rest, might be kept in good plight without other food than a plenty of good grass or good hay. And as this double set would double the supply of beef, tallow and leather, a set off is found in that consideration for a double consumption of that kind of food.

The objections generally made to the ox, are, viz: 1. That he is less tractable than the horse. 2. That he does not bear heat as well. 3. That he does not answer for the single plough used in our cornfields. 4. That he is slower in his movements. 5. That he is less fit for carrying the produce of the farm to market.

The first objection is certainly founded in mistake. Of the two animals, the ox is the most docile. In all countries where the ox is the ordinary draught animal, his docility is proverbial. His intractability, where it exists, has arisen from an occasional use of him only with long and irregular intervals; during which, the habit of discipline being broken, a new one is to be formed.

The second objection has but as little foundation. The constitution of the ox accommodates itself, as readily as that of the horse, to different climates.—Not only in ancient Greece and Italy, but throughout Asia, as presented to us in ancient history, the ox and the plough are associated. At this day, in the warm parts of India and China, the ox, not the horse, is in the draught service. In every part of India, the ox always appeared, even in the train of her armies. And in the hottest parts of the West Indies, the ox is employed in hauling the weighty produce to the sea ports. The mistake here, as in the former case, has arisen from the effects of occasional employment only,

with no other than green food. The fermentation of this in the animal heated by the weather, and fretted by discipline, will readily account for his sinking under his exertion; when green food even, much less dry, with a sober habit of labor, would have no such tendency.

The third objection also, is not a solid one. The ox can, by a proper harness, be used singly as well as the horse, between the rows of Indian corn; and equally so used for other purposes. Experience may be safely appealed to on this point.

In the fourth place, it is alleged that he is slower in his movements. This is true; but in a less degree than is often taken for granted. Oxen that are well chosen for their form, are not worked after the age of about eight years, (the age at which they are best fitted for beef) are not worked too many together, and are suitably maintained, may be kept to nearly as quick a step as the horse. May I not say, a step quicker than that of many horses we see at work, who, on account of their age or the leanness occasioned by the costliness of the food they require, lose the advantage where they might have once had it!

The last objection has most weight. The ox is not so well adapted as the horse to the road service, especially for long trips. In common roads, which are often soft, and sometimes suddenly become so, the form of his foot and the shortness of his legs are disadvantages; and on roads frozen or turnpiked, the roughness of the surface in the former case, and its harshness in both cases, are inconvenient to his cloven hoof. But where the distance to market is not great, where the varying state of the roads and of the weather, can be consulted; and where the road service is in less proportion to the farm service, the objection is almost deprived of its weight. In cases where it most applies, its weight is diminished by the consideration, that a much greater proportion of service on the farm may be done by oxen, than is now commonly done; and that the expense of shoeing them, is little different from that of keeping horses shod. It is observable, that when oxen are worked on a farm, over rough frozen ground, they suffer so much from the want of shoes, however well fed they may be, that it is a proper subject for calculation, whether true economy does not require for them that accommodation, even on the farm, as well as for the horse.

A more important calculation is—whether in many situations, the general saving by substituting the ox for the horse would not balance the expense of hiring the carriage of the produce to market. In the same scale with the hire, is to be put the value of the grass and hay consumed by the oxen; and in the other scale, the value of the corn, amounting to one half of the crop, and of the grass and hay consumed by the horses. Where the market is not distant, the value of the corn would certainly pay for the carriage of the market portion of the crop, and balance moreover, any difference between the value of the grass and hay consumed by oxen, and the value of the oxen when slaughtered for beef. In all these calculations, it is doubtless proper not to lose sight of the rule, that farmers ought to avoid paying others for doing what they can do for themselves. But the rule has its exceptions; and the error, if it be committed, will lie not in departing from the rule, but in not selecting aright the cases which call for the departure. It may be remarked, that the rule ought to be more or less general, as there may

be, or may not be at hand, a market by which every produce of labor is convertible into money. In the old countries, this is much more the case than in new; and in new, much more the case near towns, than at a distance from them. In this as in most other parts of our country, a change of circumstances is taking place, which renders everything raised on a farm more convertible into money than formerly; and as the change proceeds, it will be more and more a point for consideration, how far the labor in doing what might be bought, could earn more in another way, than the amount of the purchase. Still it will always be prudent, for reasons which every experienced farmer will understand, to lean to the side of doing rather than hiring or buying what may be wanted.

The mule seems to be in point of economy, between the ox and the horse, preferable to the latter, and inferior to the former; but so well adapted to particular services, that he may find a proper place on many farms. He is liable to the objection which weighs most against the ox. He is less fitted than the horse for road service.

Feeding Cattle.—In young growing animals the powers of digestion are so great, that they require food which is less rich, than such as are of mature age. They also require more exercise. If rich food is supplied in liberal quantities, and exercise withheld, diseases are generated, the first of which may be excessive fatness; growth is impeded by very rich food, for experience shows, that the coarsest fed animals have the largest bones. Common sense will suggest the propriety of preferring a medium course between very rich and very poor nutriment.

—London.

Regularity of feeding cattle is of prime importance. Three times a day, precisely at a certain hour, cattle, according to Mr Lawrence, should be furnished with their food. Mr Deane observed, that neat cattle and horses should not have so much laid before them at once as will quite serve to fill them. The hay they have breathed on much they will not eat up clean, unless they are very hungry. It is best, therefore, to fodder them twice at night, and twice in the morning. Let neat cattle as well as horses have both light and fresh air let in upon their fodder when the weather is not too cold and stormy to allow the windows to be open. What one sort of cattle leave should be thrown to another sort. Those that chew the cud will eat the leavings of those that do not, and vice versa.

Stables.—Young horses generally are accustomed to live and breathe in a pure and open air till they come of age, and are fit for labor; it is then found convenient to house them; this produces a considerable change in their bodies, and makes them liable to be greatly affected by the temperature of the air which surrounds them, and in which they breathe.

That stables are generally kept too close and hot, requires no demonstration, as every one who goes into them, even when the weather is pretty cool, must have discovered this from their own feelings; and in the summer season the heat within them is increased to a very great degree. What renders it still worse, it frequently happens that from the situation and structure of many stables, no opening can be made to allow a sufficient quantity of fresh air, so as to enable horses confined in them to breathe with any tolerable degree of freedom. The door is the entrance for air, and that can only happen occasionally when it is open.

It is true the intercourse that must unavoidably take place through the day in going out and in renders such stables tolerably fresh aired; yet in the morning when the door has been shut for some hours through the night, and especially in the summer, the heat is intolerable, and the air so foul that a man can hardly breathe in it, whilst at the same time the sharpness of the sultry, arising from the horse's urine, &c., attacks his nose and eyes, and occasions a copious discharge of tears.

From the Genesee Farmer.

CATERPILLARS.

MR. EDITOR.—Among the many remedies applied to fruit trees for protecting them from the ravages of the caterpillar and other insects, I have never tried any with more success than strong soap suds, which has been frequently recommended, particularly in your paper. Early last spring I observed an uncommon indication of insects, more particularly on apple trees; the first which made their appearance were small green lice accompanied by the black ant, which completely covered the buds of apple trees as they were putting out buds for blossoms and leaves. They were soon followed by the caterpillar, whose combined efforts I had great reason to expect would at least destroy all the fruit, if not the trees. I immediately on discovery applied a very strong soap suds with an old broom to the bodies and limbs of the choicest trees, likewise sprinkled it into the tops of the tree, as faithfully as practicable. A few days after I examined them, and indeed found no insects; but the buds had the appearance of having been singed by fire. They however shortly came forward, and assumed an uncommonly healthy appearance, and have ever since been entirely free from any insect whatever.

I think it more necessary to notice the effect of soap on insects, as its being made more generally known, and within immediate reach of every farmer and horticulturist, it would not likely be neglected at the proper season. I would suggest that it be applied to the bodies and branches of trees, early in the spring, before the eggs fastened to the bark are hatched by the heat of the sun. I have no doubt but it would, if used several times during the warm season on the bodies and about the roots of peach, cherry and plum trees, protect them from the effect of the borer and other worms which injure them.

I have applied soap suds this summer to my hills of cucumbers and melons, and have not been at all troubled with worms, and very little by the striped bug, while my neighbors complain bitterly of their ravages.

I am respectfully yours,

ALMOND STEPHENS.

Warsaw, Gen. Co. June 13, 1831.

HESSIAN FLY.

This insect has made its appearance this season, in this section, but to what extent they have damaged the wheat we have not yet learned. As the habits of this insect are well known, farmers should guard against their ravages. They may be found, at the time the wheat is in blossom, between the stalks and lower leaves, in the chrysalis state, somewhat resembling a flax-seed. During the time the kernel is in the milk, they hatch out and become moths, and deposit their eggs upon the kernel, which is too small to be visible to the

naked eye. When such wheat is sown, should the autumn be warm, they hatch, and the larvae ascend the young stalks, and locate themselves among the leaves, as far down as possible. In this situation they may be found before and after they are transformed to the chrysalis state, having fed upon the juices of the young stalk, which they materially injure. As the insect itself is not a great traveller, it is easy to destroy the egg before sowing the wheat. For this purpose, place the wheat, intended to be sown, in a basket over a tub, and pour over it strong caustic ley, scalding hot, after which the wheat may be sown, and the increased vigor with which wheat so managed will shoot, will compensate for the trouble, separate from the destruction of the egg of the Hessian fly. We recommend it to farmers to examine their fields, and if any signs of the fly are to be found, to scald their wheat the coming season, before sowing, which will prevent them in the next crop.—*Genesee Farmer*.

Watching the Swarming of Bees.—The hive is placed upon a weighing beam, about three feet eight inches long, with a board on the other end, on which are put stones, of the weight of the hive.

When the bees begin to cast, (an ordinary top swarm is between 4 lbs. and 5 lbs. weight,) and when the first pound's weight of bees have left the hive, the beam will turn back a little, the same way as a merchant's scale does on the counter; but before the scale rests it forces out a trigger like the pin of a mole trap, which lets off a small iron wire to a bell in the house, that gives sufficient warning to the bee-mother, to go and take care of the swarm. The above method has been practised several years by Mr. Duncan, gardener near Ayr.—*Glasgow Chronicle*.

Cider.—It is a matter of wonder, why, with the exception of some part of New Jersey, and Dutchess and Orange counties in New York, no part of the northern and middle states should have the reputation of making good cider. By good cider we mean that which will not become so sour as to be unfit to drink in two or three months after it is made. New England throughout, possesses a soil which produces every variety of apples in the greatest abundance, and yet we suspect that it will be found that very little cider, comparatively, finds its way from thence, either to the city of New York, or other places still farther south. At any rate, we hear of none from that quarter which is held in repute, like that from New-Jersey. The public tables in New York are not supplied with good cider except at a charge of 25 to 50 cents a bottle. As cider forms a very considerable article of export from our country, we take this opportunity to suggest, that establishments in the interior might, we doubt not, be made profitable by sending cider to the city, either bottled, or fit to be bottled, as an article of merchandize.—*N. Y. Statesman*.

Dried Cherries.—Few people know how to prize dried cherries, and fewer still ever take the trouble to dry them. As this is the proper season for drying them, let those who have them attend to it. It is customary to dry them without taking out the stone. This is an expeditious way of securing them, but is not the most profitable one. Let the cherries be picked as soon as ripe, and the stone taken out, and the fleshy parts spread upon plates, and put in a moderately warm oven, and

in ten or twelve hours they will be sufficiently dry for packing away. It will be said this is a tedious process, but we go upon the principle that it is best to save everything from the farm, that will turn to cash; therefore, instead of throwing away the stones as useless, dry them also, and they will always command about half as much as the cherries were worth before they were taken out, which will abundantly compensate for the trouble, besides having the dried fruit altogether more valuable. Those who save the stones for planting, should select the mazzards, where they can be had, as they make the most healthy and vigorous stocks for grafting or budding upon, but any of those kinds usually called English cherries, will answer, but the common red or Kentish will not do well, as they are of very slow growth from the seed, but are equally as good as the others for making Noyans.—*Genesee Farmer*.

A meeting of Butler (Ohio,) County Agricultural Society was yesterday held in the Court House in Hamilton. A respectable number of farmers and citizens attended the meeting.—A. I. Chittenden, Esq. president of the Society, took the chair and called the meeting to order, and the constitution read by Dr. Corey, one of the Secretaries, and several amendments thereto proposed and adopted. A few remarks were made by several members, and an essay on the WEEVIL was read by Taylor Webster Esq. After which the following Resolution was offered by Mr J. Milkin, Esq. and passed.

Resolved, That the President shall appoint a committee to report to this society at its next regular meeting rules and regulations for the annual exhibitions of the society, and also to propose the several animals, implements of husbandry and other articles for which premiums shall be offered with the amount of the premiums to be given.

We were pleased to see many of the substantial farmers from different parts of the country in attendance. The next meeting of the society will be held on the first Wednesday of July at the Court House in Hamilton.—*Hamilton Int.*

Improved Plough.—Mr Barnabas Thatcher, an ingenious mechanic of Barnstable, has invented a plough in some respects superior to those in common use.—The improvement consists of a moveable beam, to which a perpendicular motion can be given by means of two nuts on the end of the coulter, (one above and the other below the beam,) and the depth of the furrow thereby regulated. To the end of the beam inserted in the handle, an iron bent at right angles, is affixed. The bent part of which passes through the handle, and has a nut on each side, by which a horizontal movement can be given to the beam, and the furrow cut of any desirable width.—*Barnstable Journal*.

MANAGEMENT OF PIGS.

The following experiment was made by a gentleman of Norfolk. Six pigs of the Norfolk breed, and of nearly equal weight were put to keeping at the same time, and treated the same as to food and litter for about seven weeks. Three of them were left to shift for themselves as to cleanliness; the other three were kept as clean as possible by a man employed for the purpose, with a curry-comb and brush. The last consumed in seven weeks fewer peas by five bushels, than the other three; yet they weighed more when killed by two stone and four pounds (thirty-six pounds) upon an average, or six stone, twelve pounds upon the whole.—*London pap.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JULY 20, 1831.

FARMER'S WORK FOR JULY.

ENGLISH TURNIPS.—The time generally recommended for sowing English turnip seed is the latter part of July. Dr Deane, however, observed, 'I have sowed them in drills the first week in August, and had a good crop. One great advantage in sowing so late is that the turnips will escape insects. And if the crop should not happen to be quite so large as if the sowing had been earlier, the roots will not fail of being better for the table.'

'One pound of seed is the common allowance for an acre of land. But to guard against the fly the quantity may be a little increased.'

'The seed, sown broad cast must be harrowed in with a short tined harrow, and then rolled with a wooden roller, to break the clods, and level the surface.'

It is not yet too late to break up mowing or pasture ground, and raise a crop of turnips without the expense and trouble of yarding cattle or sheep on the ground, according to the customary mode of preparing for a turnip crop. Sowing broad cast will do well; but sowing in drills will do better. In either case the crop will be the better for hoeing and thinning out the superfluous plants. If the soil is not very poor a good crop may be obtained, even without manure, but a much better with manure. Wood ashes, soot and lime are said to be preferable, as manure for turnips to that which is obtained from the farm yard.

Turnips may also be raised to great advantage in corn fields. For this purpose sow a sufficient quantity of seed at the last dressing of the corn, and either hoe or rake it in.

Ellis, an old and judicious writer on husbandry, recommends soot as an antidote against the fly in turnips; and says 'Turnips sooted about 24 hours after they are up, will be entirely secured from the fly. Some advise, and it may be well, if not too much trouble, to leach soot, and sprinkle the young turnips with the liquor. It is recommended in hoeing turnips to thin them so as to leave the plants from seven to twelve inches apart every way, regulating the distance at which they are left standing according to the time of sowing, the strength of the soil, and probable size of the full grown plant.'

The time of the first hoeing is when the leaves, as they lie spread on the ground are about the size of the palm of the hand. But if the weeds are numerous and grow rapidly they should be cut or pulled out before the turnip plants arrive to that size, lest they should be drawn up slender and acquire a feeble and sickly habit. If second and third hoeings are given in the course of culture the crop and the benefit to the soil will more than compensate for the extra trouble and expense.

Loudon says that dusting rows of turnip plants, when they are in the seed leaf, is effectual in preventing the depredations of the fly. 'A bushel of quick lime,' he says, 'is sufficient to dust over an acre of drilled turnips, and a boy may be soon taught to lay it on almost as fast as he can walk along the drills. If the seminal leaves are powdered in the slightest degree it is sufficient; but should rain wash the lime off, before the turnips are in the rough leaf, it may be necessary to repeat the operation if the fly begins to make its appearance.'

DISEASE IN GOURDS:

Our correspondent S. complains that his *gourds* become mouldy and decay on the vines, and requests information relative to some remedy for the evil. As we have never witnessed nor before heard of the disease we cannot prescribe for its cure; but if the case was ours we would apply sulphur and lime water, mixed in the proportions of about two quarts of sulphur, and three to five pounds of quick lime to a barrel of water, first incorporating them with a paulful of boiling water. This liquid, applied with a syringe or watering pot as recommended by 'Circumnavigator,' page 378 of our current volume may prove efficacious. If not we must refer the case to some of our horticultural friends, who are best qualified in the diseases of vegetables.

Cucumbers.—We have authority to state that the sale of cucumbers, at stall No. 84, Faneuil Hall Market, Boston, raised on one acre of ground this season, previous to the 16th of July, amounted to upwards of \$500.

The weather has been for a length of time, wet and sultry; it is feared that much grain is injured. We firmly believe, we are not guilty of exaggeration when we say, that half of the wheat and rye crop of this country is ruined, and the well earned prospects of the farmer, just at the point of consummation, are destroyed. We seriously do not believe, that there will be enough of grain in the country to seed it next fall. That which is cut, has grown in the shock, and that which was left standing, has sprouted in that position. This loss, in a great measure, attributed to culpable negligence, in declining to cap the shocks as they are set up. The crop every where, was a most abundant one. The corn looks well.—*Lancaster Penn. pap.*

Crops in the Interior.—The Worcester *Agis* gives the following facts in relation to the crops in that vicinity. Hay is abundant. Rye is said not to be as good as usual, being somewhat shrunk in the kernel. Corn never, perhaps, looked better than it now does. There will be but few apples this year, and we are informed that cider has been contracted for already at prices varying from \$1.50 to \$2 per barrel. Peaches are scarce: the late frost last spring, while the trees were in blossom, it is supposed materially affected the crop.—Cherries are very scarce; and there will be but few plums. Our early potatoes came in very fair. The season, as it respects the quality and quantity of the more essential crops, may be considered upon the whole as favorable for the farmer.

TO FARMERS.—A writer in the *Norwich Courier* says—'If grass when mown, is carefully turned every day it will injure very little. The great cause of injury is its laying on the ground through a long spell of rainy weather. If it lay more than one day, it becomes mouldy, and turns black. If carefully turned daily, "rain or shine," it will not lose color. This is the result of many years' experience.'

The Canandaigua Repository states that the quantity of wool purchased by the merchants at that place, this season, exceeds 100,000 lbs. for which high prices have been paid. A single load brought in by a farmer, weighed 2,979 lbs. for which he received \$2,175.

From the Boston Traveller.

BLACK CHERRY TREE BARK.

MA EDITOR.—Having seen in a late Traveller, a statement from a medical correspondent of the Cooperstown Watchtower, that black cherry tree bark was poisonous, I felt it my duty to state for the information of the public, that in the latter part of the year 1825, I was afflicted with a nervous complaint, called by physicians, St Vitus' Dance, and that at the recommendation of a friend, I drank two glasses a day of a tea made by steeping the bark of the wild black cherry tree in water, mixing it, however, with spirit sufficient to prevent it from moulding. The bark to which the Cooperstown doctor alludes, may have been taken from the garden cherry tree. At any rate I should like to have the thing fully tested; for in my opinion, the bark of the wild black cherry tree is a sovereign remedy against a disorder, which may justly be said to be the most humiliating that ever afflicted the family of man. It cured me, and if I was again attacked, should not hesitate a moment to drink it again. B.

The Wheat Crop.—We have taken considerable pains to inquire with respect to the prospects of the wheat harvest in this part of the country, and from all we can gather upon the subject, we are led to believe that the crops of wheat will be light hereabouts at least. Our information on the subject does not allow us to speak in regard to a very wide extent of territory, but so far as we have been enabled to collect intelligence, we learn, that a fly is making great depredations upon the wheat, and besides, it is pretty certain, that some fields are overrun with *chess*, and the same is the case with all, more or less.—What will be the effect of the present wet weather is uncertain. We hope for the best.—*Vienna N. Y. Republican.*

At the rooms of the Albany Horticultural Society, on the 28th ult, two winter squashes of last year's growth, very large and in fine preservation, were exhibited; one of them measured 37 inches in length, and weighed 19 pounds.

TROY AND VERMONT RAIL ROAD.—Stock in this rail road was subscribed for in the following places.

New York, 3530 shares, \$100 each,	\$353,000
Troy, 1098 " "	109,800
Bennington, 346 " "	34,600
Adams, 35 " "	3,500
	\$500,900

The capital stock necessary to be paid in is \$150,000.—*Troy Budget.*

The Amboy and Camden Rail Road is rapidly progressing, and is expected to be completed the present season, as will also be the Hudson and Mohawk Rail Road.

The following is an extract of a letter from a gentleman in Liverpool, to a correspondent in Troy:—Our rail road surprises more and more every day.—The trains go regularly from Liverpool to Manchester in an hour and a quarter. On Friday 2050 passengers were booked for that place. One thousand bales of New Orleans cotton arrived here one day by noon on the next the whole was delivered in Manchester. These are facts that prove more every day the superiority of rail road communication.'

Wool.—About one hundred and thirty thousand pounds of Wool have been purchased in this village, the present season, for which the farmers of our country have been paid about \$80,000, mostly in cash. — *Ontario Messenger.*

An additional section of the Baltimore and Ohio Rail Road has been completed, so that 26 miles are now in operation.

A new factory is to be erected at South Berwick. A building to contain four thousand spindles, is to be put up immediately.

Ripe pears of the Jargonelle kind have been gathered from a tree of D. Shattuck, Esq. of Concord.

Complaint is made in the New Haven Herald of charcoal men: and one, with hardly any exertion, compressed four bushels into a common flour barrel; and an old gentleman who bought eight bushels measured in a two bushel basket found, on re-measurement in a half bushel measure, that it held out but six. In this quarter, large brands sometimes adhere strongly to the bottom of the basket, and travel to and from the cart several times.

Optical Deception.—It is stated by a traveller and observer, on the Liverpool and Manchester Rail Road, that while travelling at the rate of 12 or 15 miles per hour, objects from the carriage window, appear as they do from a stage coach, to recede, or move in an opposite direction to that of the carriage, but when the speed increases to 24 and 30 miles in the hour, they no longer appear to recede, but to move in the direction of the carriage. This is explained on philosophical principles. It is worthy the thoughts of the curious and ingenious.

Messrs Dunott and Fairbank, of Wilmington, Del. have lately invented a machine, by which (says the Delaware Journal) they are enabled to expedite the production of biscuit or crackers, to almost any extent. It is added that, in the present incipient state of the machine, it will make sixty thousand handsomely finished crackers in an hour! The machine is said to be a neat piece of workmanship, occupying little more space than a common spinning wheel. The inventors have obtained a patent for this notable cracker-spinner, and propose sending a model to England.

The oldest man.—In April, 1828, there died at Pleskoff, in the government of Novogorod (Russia) a farmer named Michofsky, who had attained the wonderful age of 165 years. He led a very sober life, though occasionally he partook of ardent spirits. He never ate meat more than twice a week. At 120 he still labored in the field, and only desisted on account of a sprain in his foot. He left 4 children, 36 grand children, and 16 great-grand children. His mother lived to the age of 117, and one of his sisters to 112, but his father died at 52.

Lightning Points.

Just received, a further supply of Treble Gilt Lightning Points, and Glass Blocks, which are for sale at the Agricultural Warehouse, 52, North Market street.

Coccons Wanted. For sale at the Agricultural Warehouse, Expanding Cultivators, Howard's improved Ground Mould Board Ploughs, different sizes. July 20.

The Subscriber will pay cash for Coccons, from 25 to 50 cents, according to quality. J. H. COBB.

Dedham, July 15th, 1831. 8c July 20.

Lynn Mineral Spring Hotel,

Ten miles from Boston, Six from Salem, and Five from Nahant. The Subscriber most respectfully begs leave to inform his friends and the public that he continues to keep that delightful Summer retreat, the Lynn Mineral Spring Hotel, which it will be his object to render a genteel and pleasant resort for Boarders, Parties of Pleasure, transient Visitors, &c.

The salubrious qualities of the waters of this celebrated Spring—the beautiful lake, on the borders of which the establishment is situated, abounding with fish of various descriptions, and surrounded with the most wild and romantic scenery—splendid Boats for sailing or fishing—Bathing rooms on the margin of the lake, where the warm or cold bath may at any time be taken—the delightful situation of the House, with its comfortable and well furnished apartments, with the fruit and flower Gardens adjoining, are attractions for those in pursuit of health or pleasure, rarely excelled if equalled in any part of the country.

Every exertion shall be made to merit a continuance of that patronage which has been so liberally bestowed. July 20. JAMES W. BARTON.

Bees.

The Subscriber has 300 swarms of Bees for sale, in his Patent Slide Beehives, at 20 cents per pound, weight of each swarm from 40 to 100 lbs. tare of hive deducted; the price of the Patent hives is \$2 a piece, and the price of a single right \$5.

Also for sale, 200 swarms of bees in the old fashioned hive, price 17 cents per pound, tare of hive deducted.

The above will be delivered within fifty miles of Boston, in good order, (warranted free from moths or otherwise damaged) by the first day of March, 1832.

All letters must be sent in before the first day of September, 1831, post paid, to the subscriber, at Brighton, Mass. so as to have time to transport them from Maine.

N. B. The weight of the above hives will be taken in September. EBENEZER BEARD. July 6. ep2m

Medical School in Boston.

The Medical Lectures of Harvard University delivered in Boston will be commenced in the Autumn, at the usual period, viz. on the *third Wednesday in October*. They will be continued four months.

This extension, in the term of the Lectures has been thought necessary to afford time for such a course of instruction and demonstration, as is deemed by the Faculty to be requisite, under the advantages which have recently accrued to the School.

The Legislature of Massachusetts, with an enlightened liberality, which does honor to our age and country, have extended the protection of law to the cultivation of Anatomy within this Commonwealth. The advantages which will hence result to students resorting to this school will be sufficiently obvious. It will be the aim of the Professors to carry into effect the intentions of the Legislature, in such a manner as to evince at the same time their respect for the rights of humanity, and their interest in the promotion of the healing art.

The opportunities for practical instruction at the Massachusetts General Hospital continue undiminished.

The course of Lectures will be—

On Anatomy and Surgery, by Dr Warren.

“ Chemistry, by Dr Webster.

“ Materia Medica, by Dr Bigelow.

“ Obstetrics and Medical Jurisprudence, by Dr Channing.

“ Theory and Practice of Physic and on Clinical Medicine, by Dr Jackson.

WALTER CHANNING,

Dean of the Faculty of Medicine.

Boston, June 15, 1831. 6c July 16.

Bones Wanted.

Shin and Leg Bones constantly purchased by GEO. H. GRAY & CO. No. 68 Kilby street. April 20. 2mos

Wanted,

A young woman from the country, from 18 to 30 years of age, who is neat and faithful, may hear of an excellent situation to do the ordinary work in a small family, (who reside in the country during the summer,) where she will receive good treatment and the highest wages. Also wanted in the same family, a young girl from 14 to 16 years of age, to take care of children. Apply at the Farmer office, 50 1/2 North Market street. July 20.

30 Dollars Reward.

The above reward will be paid by the Subscriber for the detection and conviction of the vile wretch or wretches who have been base enough to break down a large number of young rock maple Trees, set out on the road adjoining his Farm, leading from Dedham turnpike to Brushhill turnpike, for the purpose of shade and ornament. As the vile wretch who could be guilty of such a crime is dangerous to the community, it is hoped that the citizens of Roxbury and Dorchester will be vigilant in endeavoring to detect him, in order that he may be brought to public justice. JEREMIAH HILL. July 20.

Wrought-Iron Ploughs.—Bar-iron, &c.

Wrought-Iron Ploughs, of all sizes.—Also, A Complete assortment of American, English, Swedes and Russia Bar Iron—American Braziers' Rods—Spike and Nail Rods, Shoe-Shapes—Hoop and Band Iron—Steel of all kinds—Pipe-box and Mould-board plates, &c. constantly for sale by GAY & BIRD, No. 44, India Street, Boston. 6cis.

BOSTON FANEUIL HALL MARKET is now abundantly supplied with all the vegetables of the season, at the following prices: New Potatoes \$1 per bushel.—Early Peas 2 to \$3 per bushel. New Corn for boiling, 12 1/2 cts. per dozen ears. Early York Cabbages, 37 1/2 to 50 cts. per dozen. Early Squashes, 12 1/2 cts. per dozen.—Turnips and Carrots, 6 1/2 cts. per bunch. Beets 15 cents per doz. Marrowfat Peas and String Beans, \$1 per bushel. Cucumbers 12 cts. per dozen. Mr Rand, at stall No. 84, has received upwards of \$500 for Cucumbers the present season.

MISCELLANY.

From the Ladies' Magazine.

THE LITTLE FOOT.

My boy, as gently on my breast,
From infant sport thou sink'st to rest,
And on my hand I feel thee put,
In playful dreams thy little foot,
The thrilling touch sets every string
Of my full heart a quivering;
For ah! I think, what chart can show,
The ways through which this foot may go?

Its print will be, in childhood's hours
Traced in the garden, round the flowers;
But youth will bid it leap the rills—
Bathe in the dews of distant hills—
Roam o'er the vales, and venture out,
When ripper years would pause and doubt;
Nor brave the pass, nor try the brink,
Where youth's unguarded foot may sink.

But what when manhood tints thy cheek,
Will be the ways this foot may seek?
Is it to lightly pace the deck?
To helpless, slip from off the wreck?
Or wander o'er a foreign shore,
Returning to thy home no more,
Until the bosom, now thy pillow,
Is low and cold beneath the willow?

Or is it for the battle's plain,
Beside the slayer and the slain!
Till there its final step be taken—
There sleeps thine eye no more to waken
Is it to glory or to shame—
To sully or to gild thy name—
Is it to happiness or woe,
This little foot is made to go?

But wheresoe'er its lines may fall,
Whether in cottage or in hall,
O, may it ever shun the ground
Where'er His foot had not been found,
Who on his path below has shed
A living light that all may tread
Upon his earthly step; and none
E'er dash the foot against a stone!

Yet if thy way is marked by fate,
As guilty, dark and desolate—
If thou must float by vice and crime,
A wreck upon the stream of time:
Oh! rather than behold that day,
I'd know this foot, in lightsome play,
Would bound, with guiltless, infant glee,
Upon the sod that shelters me.

H. F. G.

TEMPERATE DRINKERS,

Listen to a statement of what you are doing, made by an enlightened and benevolent physician.—Dr James Moultrie, Jr., of Charleston, S. C., in a letter to a Committee of the Columbia Temperance Society, says:

"I know of no enemy to domestic bliss, comparable to this. Its most dangerous feature is its apparent innocence, at first. I consider the peace of no family to be secure so long as the use of distilled spirits is the popular drink of a community. All are interested in its exclusion, if not for themselves, at least for those whom perhaps they do not know as well as themselves. But where is the individual, at all given to its use, who can venture to predict his entire immunity from its danger! Who that has ever been subdued by it, can from his sad experience, recall the moment when he became its slave? Who that is now

wretched in his capacity, is half conscious of his chains and his misery? Who knows where to stop? where, in his own case, the line of demarcation is drawn? or is willing to accept the opinion of another? or sure that it will be given in time, even where duty of friendship urges to its deliverance? Were it not that the moderate use of it by the temperate is tolerated in society, the vice of intemperance would be unknown. The evil therefore lies with them. They are the corrupters of the morals, and the destroyers of the prosperity of the community. The proximate cause of drunkenness is temperance. The instigators to intemperance are sober, who, for the gratification of a minute, pay a bounty to the vice. The tempters to the sin, are those who use it in moderation. Its subjects upon the temperate. Its victims are among them. They cause it—they support it—they propagate it—they subscribe to it privately, publicly, by compact and by personal contribution. The remedy must therefore be applied to the source of evil.—The efforts your society, it appears to me ought to be aimed at them. And he shall truly deserve to wear the civic wreath, who shall be so fortunate as to point out the means, by which the temperate in the land, can be brought to a final, if not a consensuous determination to relinquish the use of it."—*Journal of Humanity.*

From the Saturday Evening Post.

ANECDOTES OF A MONKEY.

Many pranks have been recorded as being the work of that most immitable imitator, the monkey. It has been my desire to add a few anecdotes to those upon record. The following were related to me by a gentleman from St Domingo, who was the owner of the animal of which I am about to speak.

A few of the feats of Jacko—a favorite Monkey.

The cook was one day very busy picking chickens and preparing them for roasting. Jacko, seated on the window of the kitchen, paid particular attention to all of these operations. No further notice was taken of him till next morning, when he was found diligently rolling in the ashes four small ducks, which he had picked and skewered, *secundum artem*.

His principal amusement was to set dogs to fighting. Sometimes, whilst walking on the roof of the house, he would perceive a strange dog on the plantation. He would immediately give a shrill cry, with which the dogs of the house were so well acquainted, as immediately to flock around him. The whole gang, with Jacko at their head, then sallied out to encounter and drive away the intruder. So soon as the combat was engaged, Jacko would run to some small hillock, some fence, or some low tree, and there testify his joy by a laughter and chattering, interrupted only from time to time, to hiss the dogs on.

Having once while accompanying his master on a visit, seen a gentleman's son take his lesson in writing, Jacko, the moment he reached his home, leaped to the ink-pot, dabbed his paw with the liquid it contained, and proceeded to draw his pot-hooks and fiddles on a white bed quilt, which unfortunately was near him.

He was often seen in the garden, digging up plants, and again burying them root upwards.

Some masous were busy repairing the ceiling of the apartment in which Jacko with his mistress usually passed the night. Jacko eyed their work with signs of great pleasure, and immediately running to the milk house, he paddled up the butter and cream cheese together, and then plastered the wall with this mixture, for several feet.

The exploit in which he showed the most instinct was in fishing. He was several times seen occupied in this employment—his method was this:—He placed a small basket in the water near the edge of the brook. After making it fast by piling stones behind it, he would go about ten yards above the basket; there getting into the water and agitating it very violently, he would suddenly leave this occupation; then running to the basket would slowly throw it upon the grass to a distance from the water. In this manner he never failed to obtain numbers of the small fry which were driven into the basket by his agitation of the water.

C. G.

Valuable and Cheap Land—for Sale.

The subscriber offers for sale, 14,000 acres of choice Land, situated in the town of Pinckney, county of Lewis and state of New York. Some of the land is improved and under cultivation. The country is remarkably healthy, being entirely free from the fever and ague and from the common bilious fevers, which often afflict the towns upon Lake Ontario, this town being 15 miles east of the lake. The soil is principally a sandy loam, much of it covered with rich black mould. The timber is chiefly Sugar Maple, Black Ash, Bitternut, Beech, Elm, &c. The land yields first rate crops of Grass, Rye, Oats, Barley, Potatoes and Flax; and on some lots, good Wheat and Corn may be grown. To those wishing to obtain superior grazing farms, a fine opportunity now offers itself. The produce of pasturage and hay from an acre of this land, is very large, fully equaling if not surpassing that from the same quantity of land in any other of the Black River townships. The land is admirably well watered, there being but few lots which have not durable running streams upon them. The land is well adapted to Orcharding—the Apple tree thriving very well in this county. Stock of all kinds may be disposed of with the least possible trouble, and to the greatest advantage, the drovers purchasing at the very doors of the farmers, and paying the highest cash prices for their cattle, which will readily find purchasers at all seasons of the year. Several farmers at present residing on this town, were originally from the New England States, and some of them from Massachusetts, who are in thriving circumstances. The above described land is offered for sale at the very low price of from two dollars and a half to three dollars per acre, for the uncleared land, and from three dollars and a half to five dollars and a half for the improved lots. The land will be sold in lots to suit purchasers, and from two to five years' credit for payment in annual instalments, will be given. As a further convenience to purchasers, the subscriber will receive in payment, Cattle, Sheep, Pork, Grain or Grass Seed, for which products he will allow the highest cash prices. The title to the land is indisputable, and good Warranty Deeds will be given to purchasers. Persons desirous of purchasing will please to apply to the subscriber, at Henderson Harbor, county of Jefferson, State of New York, or to DANIEL CAMPBELL, Esq. on the town. JAMES H. HENDERSON.

Immiration

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 15 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. If Jan.

Hickory.

This astonishing fleet horse was raised in Montreal, as from an English blood mare, (sire unknown), is not inferior to any in the U. States for speed, action and beauty. He is a fine sorrel, well built, good size, and pronounced by (good) judges in every respect a first rate horse; trots a 3 minute gait, last walker, and has paced around the trotting course, Long Island, in 2 minutes, 34 seconds, and was offered publicly to match against any horse that could be produced. It is considered unnecessary to say more, as his qualifications are too well known to be doubted.

He will stand at Abbott's Inn, Holden, during the season. Terms \$8, the season. 6th May 11.

Published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[P] No paper will be sent to a distance without payment being made in advance.

CUTTING TREES.

MR FESSENDEN—In the last number of the New England Farmer, page 1, your correspondent Mr J. S. Palmer of Peterboro', New York, directs that trees should be cut when the sap is up, if it is desirable that the stumps should sprout, and observes 'that most of our forest trees do not produce sprouts or suckers from the stumps or roots if cut in winter.'

This, Sir, is directly opposed to all my observations and experience on the subject. Having woodland from which I have cut annually, for several years past, from twenty, to fifty cords of wood, it has been my practice to have it cut at the time, and in the manner that would best insure a strong and vigorous growth of sprouts. To effect this purpose I never allow a tree to be cut till after the autumnal frosts have caused the leaves to fall, and the sap to descend to the roots, nor later in the vernal season than the middle of April. The manner of cutting is to leave the stumps nearly on a level with the surface of the ground, from which the suckers are much more strong and vigorous, and less liable to be injured by high winds, than a growth from stumps cut twelve or fifteen inches high, as is the practice of some.

Pursuing this course I have never been disappointed, and have now on land, from which trees were cut in the midst of winter, a growth of sprouts of the most vigorous and promising appearance.

Respecting large trees, the growth of centuries, cut them at whatever season you please, there is scarcely one stump in a thousand that will produce suckers.

In a community where fuel is an expensive article, every proprietor of woodland should manage it in such a way, as not only to be profitable to himself, but, as shall preserve the growth for the generation to come.

I am, Sir, respectfully,

Your obedient servant,

Lynnfield, July 23, 1831. J. NEWHALL.

BEES.

MR FESSENDEN—Any experiments made in the management of Bees if successful, ought to be made public, for the benefit of those who have old honey or full hives.

I purchased in the fall of 1829 a small swarm of Bees; they worked well through the summer following, but did not swarm. In the spring of 1830 I had a tight house made agreeably to Doct. Thacher's method, and an empty hive put by the side of the old one and opened a communication through the new hive; the Bees made some honey in the hive and considerable in the house; in July I turned the old hive upside down and put a new one on top and the Bees went to work in the new hive, continuing the comb upwards from the old to the top of the new hive. About 10 days since, I determined to drive the bees from the old hive into a new one; I separated the top from the old hive by cutting with a large knife the comb across the bottom, and took off the top hive and set it on

the stand and then replaced the old hive on its bottom and in a few days found I had got two separate colonies of Bees. Monday morning, the 11th, I drove the bees with water from the old hive into a new one without losing a hundred bees, and obtained 30 lbs. of honey and comb. I used a new apparatus invented by a gentleman for his own convenience, who I hope will get a patent for it and make it as public as possible. We put two pieces of comb containing some of the young brood and fastened them in the top of the hive previous to letting the bees in. This day, Saturday 16th, the bees are to work in both hives, busily employed in increasing their stock for the winter. If you think the above will be of any use to the keeper of bees, you are at liberty to publish it.

Newburyport, July 16.

ESSEX.

From the Gardener's Magazine.

ON THE DISEASES OF FRUIT TREES IN AMERICA.

SIR—Our fruit trees are subject to some diseases, which do not seem to trouble the European gardener and orchardist. I shall notice a few of them, in the hope that you, or some of your correspondents, may aid us in discovering the cause and cure.

The plum and morello cherry trees are disfigured and destroyed by a species of gangrene. The limbs of these trees, and the trunks, when small, swell, crack, and exhibit irregular tumors, of a spongy appearance, which are first green, but change to a black color. The branch soon dies; the sap seems to become vitiated, and, if the diseased parts are not amputated, the entire tree generally falls in one or two seasons. An insect, in its larva state, is generally found in the recent tumors, which Professor Peck has denominated the *Rhyncelus cerasi*; the same, he thinks, which occasions the fall of peaches, apricots, and plums (a formidable evil here), by the larva eating into the kernel of those fruits long ere they have attained their growth; or another species of the same genus. The first conclusion is probably not correct; for the fruit, in many localities, is destroyed, where the trees have continued healthy. The only efficient remedy that I am advised of, is to cut off and burn the affected parts. All of our stone and many of our seed fruits are grievously injured by insects, which prey upon them in the early stage of their growth, and cause them to drop. Although we can identify the enemy, we are without the means of repelling his attacks.

We have lost many of our pear trees by what is here termed the blight. The disease is generally first discovered upon the smaller branches, often at a distance from their extremities, by the leaves and bark, at a particular point, becoming black and dead. The foliage and wood above appear fresh and green for some days. At other times, the bark upon the trunk, or at the junction of the main branches, becomes dead in irregular blotches, contracts, and ultimately separates from the wood. In three instances, this season, I have found a circle of bark upon the trunk wholly dead, while all above appeared healthy and vigorous. The seat of the disease seems to be in the cambium, or elaborated sap, which becomes a medi-

um for its extension. The progress of the disease is rapid, in proportion to the vigor of growth in the tree; rich soils and wet seasons being most prejudicial. The evil is confined to no soil or situation, though it is less prevalent in stiff grounds and grass lands. The apple and quince appear to be generally though less seriously affected. Some pretend to trace the evil to an insect, the *Scolytus pyri*; yet my observations have tended rather to multiply than to dissipate the doubts which I have had as to the cause of the malady.

The gooseberry and the grape, particularly the foreign varieties of the latter, are very liable to be destroyed by mildew, when partially grown; and three fifths of these crops are thus usually lost.

A subscription is circulating among us to raise 2000 dollars, to be awarded as a premium for the discovery of a preventive of the depredations of insects upon our stone fruit. Any thing you can offer, therefore, upon the subject of the preceding remarks, will be particularly interesting to your American readers, of whom there are many, and the number is likely to increase as we advance in horticultural improvement. Your publications are much sought after, and highly valued. The Society of this place, of which I am president, subscribes to your Magazine. We have in this state six horticultural societies. The subjects of education and rural improvement are the popular topics of the day. We have a respectable Lyceum in this city, which has published a volume of *Transactions*, consisting of original papers in relation to the natural sciences. The volume will be sent to you if you desire it, and was disappointed in not finding a descriptive catalogue of fruits in your *Encyclopaedia of plants*. I think you promised one. Cannot you send me such a catalogue?

In a former letter I took the liberty of requesting your good offices in establishing a correspondence with some respectable nurseryman of your country; and I believe I have occasionally sent you some cuttings of fruit, and pamphlets that I thought would be interesting. I have made like communications to the Horticultural Society. I have not yet had the satisfaction of learning, from you or from Mr Sabine, whether my cuttings or my requests have ever reached their designed destination. We have probably the best location for a nursery in the Union, and the demands upon it exceed our means of supply. We are anxious to give it a character equal to its advantages of location, and to enrich it with all the finer fruits of Europe. It is the importance of obtaining a correspondent on whom we can rely, that induces me to renew my importunities for your aid in this matter. Mr Saul of Lancaster has encouraged us to hope that we shall receive some grafts from you, through him in the spring. Such a favor would be particularly acceptable. We have commissioned Mr Gorden, a correspondent of your Magazine, who proposes to visit New York, to bring us several articles, particularly for the green-house; and, as he will probably see you, you may commit to his charge any communication you have to make. Command me freely whenever I can render you service.

I am, Sir, &c.

Albany, Dec. 20, 1830.

JESSE BUEL.

From the New York Farmer.

SMUT IN WHEAT.

SIR—In reply to your correspondent, N. W. T. of Newark, New Jersey, in your last month's Farmer, I beg leave to state a few particulars on the subject of his inquiries, relative to the *Weevil* and *Smut* in *Wheat*.

Your correspondent states that two persons bought seed wheat of me, in which there had been some smut. In the crop of one, there was a great deal of smut, that of the other was free from it. Was this difference owing to the soil? An answer to these inquiries would be acceptable.

To the latter inquiry, 'was this difference owing to the soil?' I beg leave to inform him, and your readers, that I have never known it the case in a single instance, and from many years of practical experience I am enabled to assert, that when seed wheat is perfectly free from disease, and prepared in a proper manner, previously to its being sown or drilled, that the soil, of whatever nature, or however great the distance, will not produce smutty wheat. The following narrative may serve to illustrate the fact.

A neighbor of mine, having purchased some very excellent seed wheat, the same was delivered in the farmer's bags of whom he had bought the wheat, with a promise that he, the purchaser, would return the bags immediately after the grain was sown or deposited by the drill. My neighbor complied with this request, and having drilled about half the quantity from those bags in which he had received the wheat, he took opportunity on the following day, which had been very wet and unfavorable, for drilling the remainder, to empty those bags, in order that they might be returned, agreeably to the proposed bargain. Thus, was this excellent, clean, and till then, unadulterated seed wheat, put into his (the purchaser's) own bags, which before had contained some very foul and diseased smutty wheat, as he, together with his farm servants acknowledged the fact. On the third day the remainder of the wheat was drilled on the same soil, and in the same field, but not from the clean bags of the sower of the seed wheat.

Now, sir, mark the result at harvest: the clean seed wheat which had been emptied into the farmers own filthy, smutty bags, produced about one twentieth part of smutty ears; whereas from the former day's drilling, not a single ear of smutty wheat could be found!

Hence the infectious disease, not only in the *Animal*, but also in the *Vegetable* world.

Should you consider the foregoing deserving a corner in your interesting and truly useful publication, I may be induced to continue my correspondence on the subject of destroying the insect called the *Weevil*. Yours, respectfully,

AN OLD FARMER.

State of N. Y. May, 1831.

From the Ohio Sun.

WEEVIL IN WHEAT.

MR EDITOR—Perhaps yourself and some of your readers may consider me as stepping out of my proper department, in offering any observations on the subject of farming, having never been myself a practical farmer.

The amount lost yearly by the weevil is so great that it almost exceeds the power of thought or calculation, and that the use of weevil eaten wheat

may occasion disease, cannot be denied.—Our food by various processes and modifications, principally by the process of *assimilation*, forms a part of our texture and organization and that healthy fluids and solids should spring from or be formed of bad materials, is contrary to all the established laws of nature.

During six or seven years past, I have examined many publications in relation to this interesting subject.—Numerous plans have been proposed to save wheat from the destructive enemy, and the method which to me appears *best*, may be found in Mackenzie's Universal receipt book, page 529; the whole secret consists in cutting wheat about eight days before it is ripe. It is stated that wheat reaped in this way is fuller and finer and never devoured by weevil, which was proved by cutting one half of a field in the green state and leaving the other half till the usual time. The early reaped portion gave a greater number to the acre and more bread by weight from the same quantity of flour. The weevil attacked that portion which was reaped late, but not the early reaped wheat.

It is stated that it is always necessary to discriminate between the ripeness of the straw and the ripeness of the grain—that straw in some seasons dries from the ground upwards, which may mislead, if the ripeness of the grain is judged from the appearance of the straw, but the true and proper time for reaping is, when grain pressed between the fingers has a *doughy* appearance, like bread hot from the oven pressed in the same way.

Wheat ought never to be stacked until the straw and portion of weeds and grass that may be mixed with it is entirely dry, otherwise it will heat in the stack. Under existing circumstances the field may be considered the best stack-yard until the farmer is ready to thrash out the whole crop—in this way the crop is sometimes saved from destruction.

Millers and manufacturers of flour generally agree, that early reaped wheat makes the best flour, and that nothing is gained by the late reaping, except more bran, and that of a darker color, which, after grinding and bolting, gives a dark color to the flour.

If one or both of the publishers of Newspapers in Batavia consider this communication worthy of publication, it is at their service.

Bethel, June 10, 1831. BENJAMIN MORRIS.

REAPING GRAIN.

The French claim the merit of a new discovery of great importance to agriculture in the advantages, which, according to them, result from the practice of reaping grain before it is perfectly ripe. This theory, which has just been promulgated by M. Cadette de Vaux, originated with M. de Salles, of the Agricultural Society of Beziers. The following are the particulars: Grain reaped eight days before the usual time, is, in the first place, secured from the dangers which threaten it at that time—this is only accidental; but a positive advantage is, that the grain is fuller, larger, finer, and that it is never attacked by the weevil.

The truth of these statements has been proved by the most conclusive comparative experiments upon a piece of grain, one half of which was reaped before the usual time, and the other half at the degree of maturity fixed by the ordinary practice. The first portion gave a hectolitre of grain more for half a hectare of land. Afterwards, an equal

quantity of flour from the wheat of each portion was made into bread; that of the grain reaped green gave seven pounds of bread more than the other six decalitres. Lastly, the weevil attacked the grain which was cut ripe, the other was exempt from it. The proper time for reaping is, that when the grain, on being pressed between the fingers, has a *doughy* appearance, like the crumb of bread just hot from the oven, when pressed in the same manner.

BEES.

It has been found by observation, that Bees will not colonize while they have space to increase and work at home. We were recently called to examine a Bee house, or Apiary constructed on this principle by Mr Munch of Putnam. It is closely covered and lined by unplanned, though jointed boards, to defend its inhabitants from the extremes of heat and cold, and divided by partitions into five chambers supported by posts about 2½ feet from the ground and about 4 feet square, and as many in height. These have doors on the backside of sufficient size, to introduce a commonhive, which is placed in front of the chamber, and raised by a small block at each corner, about half an inch from the floor; and the cap is, at the same time removed. The Bees soon adjust themselves to their new habitation which seems very agreeable to them, and begin to raise their work from the top of the hive in beautiful and sparkling conical pillars, which they attach to small bars passing at right angles across the chamber at distances of about 6 inches in a perpendicular direction, and 8 to 10 inches in a horizontal one.

As their number increases, new orifices should be made at different heights for entrance and egress, and furnished beneath with an alighting board and a weatherboard above for turning the water. The access of insects is prevented by something like a moulding, around and near the foot of each post, so made as to hold tar, or a mixture of tar with oil.

The great advantage of a house so made, is supposed to be in the greater quantity of living in proportion to the number of bees; since none of their time is lost, for want of room to deposit their store.

We hope this plan of Mr Munch, for which he intends to take a patent, and his mode of managing the bee will prove useful to the public, and be gratifying to the Maskington Agricultural Society, of which he is a member.—*Zanesville Gazette*.

From the Genesee Farmer.

HOW TO PRESERVE VARIETIES OF FRUIT.

It often happens, that gentlemen who have a taste for choice fruits, are disappointed, after having sent their orders to a distance for trees, paid their bills, and planted out their young trees with all the care possible, when after watching them from day to day, and from week to week, they find that some favorite tree will not even show a leaf, and they have the mortification to watch it, until it becomes a dry sapless figot, fit only for the fire. Now all this is extremely trying to the feelings of the lover of good fruit, not taking into consideration the expense attending it. The kinds ordered from a distance, are of course such as cannot be obtained in the neighborhood, and the loss of a variety consequently puts the Horti-

culturist back one year, if it does not wholly discourage him from repeating his order. Now such losses and disappointments, are easily prevented. When your tree arrives, let some of the best shoots be taken off and set in the ground for scions, and at a proper season, let them be grafted into some thrifty stocks, and you render your effort to obtain the variety a certainty, for we hold there is not a greater chance of failure in setting scions of apples, pears and plums, on good stocks, than there is in transplanting trees within the same garden when they are taken up, but as peaches and nectarines are more difficult to graft, we will describe a method, which we have practised this season, which seems well calculated to insure the object of the introduction of varieties from a distance. My friend L. having procured some choice varieties of Peaches from Long Island this spring, was lamenting the loss of some valuable kinds, which did not give any indications of life. He suggested that we should make an experiment by taking some of the buds from the dying limbs, and putting them into growing trees, by the process of scallop budding. I took one or two buds and fitted them in, and covered them with a piece of muslin, which had been dipped in grafting-wax, and have now the satisfaction of seeing a fine shoot growing from one of them six inches in length.—I have within the past week, put in buds from one or two other trees, which are likely to fail, not having leaved, which now have the appearance of doing well.

We therefore recommend it to our readers, as well worth the experiment, that when any choice variety is procured from a distance, to graft or bud from it, as it increases the chances of preserving it, according to the number of buds or scions set.

Hitherto, the seedling abroad for fruit, has been attended with circumstances, calculated to discourage the farmers and gardeners of Old Geesee: that is—a very great proportion of trees so obtained have failed, although packed with the greatest care. The very idea of losing has prevented many from sending, who would gladly have done it, were they certain of being able to secure, by that expense, the variety they wished. It has formerly been a practice with nurserymen not to sell scions from their choice varieties; but we believe that custom is now considered too transatlantic to be adhered to by our best horticulturists, and scions of any kind may be obtained from them at fair prices, so that there is nothing now to prevent a rapid distribution of fine fruits; and one of that will, now may procure it. The connexion of our Horticultural Societies with those of Europe, has brought every kind of valuable fruit known either in Europe or America, within the reach of our farmers; and the direction for cultivating it is daily almost forced upon them.

Bene Plant.—We have been informed that the Bene Plant, which is to be found in some of our private gardens, is an infallible cure for the summer complaint—the lives of many thousand children have been saved by this valuable remedy. A single leaf of this plant put into a half pint tumbler of pure water and stirred round, the water immediately becomes rosy, but not discolored; it is perfectly innocent—the taste not disagreeable—it has been administered with perfect safety to children, and in some instances to infants only a few days old.—*Mer. Adv.*

From the Gardener's Magazine.

ON THE INJURIOUS EFFECTS OF ANTS

On early forced Peach Trees, with the Means adopted by which they were extirpated, and the Crop of Peaches saved.

Sir.—In more than forty years' practice of my father, this is the first instance in which he has known ants to injure the bloom of peach trees. I beg to offer you a statement of the case, in hopes that it may be useful, and become a satisfactory answer to the various queries made on the subject of ants from the first to the sixth volume of your Magazine.

The earliest peach-house was shut up, and small fires applied on alternate evenings, after the 25th November; the tree roots in the outside border had been excited for some days previous. The fires were increased, and humid air applied, after the 6th of December. On the 10th, some few ants were observed traversing the trellis in quest of their natural food produced by the aphids. But as great attention had been paid to washing every shoot with a hard brush and cold water when the trees were pruned and tied, no aphid eggs nor aphid capsules remained on them.* This probably caused the ants to injure the peach blossoms, which was not discovered until the opening of the petals of two or three of the very earliest blooms, when the filaments, anthers, and pistillum were observed to fall out of the corolla. On closer examination, we found that many of the earliest blossoms had the unexpanded petals perforated, the filaments eaten out, and the ants lodged in the nectaries feeding upon the honey. This was on the evening of the 13th of December, and we immediately commenced killing them by hand, dislodging them from the blossoms with slender wires; this was continued by candlelight until most of the ants then on the trees were destroyed. We were going to apply the ant-trap of Mr. Boyce (Vol. v. p. 730.); but it was suggested that recently cooked bones of roast or boiled meat or fish were used for ant-traps on the Continent; and we adopted them with good success. They prevented any more ants from ascending the trees, until the colony discovered itself under the fire-flue at its entrance into the peach-house. They were immediately supplied with the preparation as below, and two days after not one ant remained, nor have any appeared since; but it is necessary to watch the spot for some weeks after a similar destruction, lest any eggs should produce a new colony:—

Take thin slices of wheat bread (say $\frac{1}{2}$ oz. weight), dry it slowly, but well, that it may easily pulverise in a mortar; take $\frac{3}{4}$ oz. of fine loaf sugar, pulverise it also; add to the two former ingredients $\frac{1}{2}$ oz. oxide of arsenic, commonly called levigated mercury; triturate the whole well in the mortar, then put it into a clean dry glass bottle; of course the bottle should be labelled with the word 'Poison.' Very small portions of this poison may be applied on fragments of glass or the flat side of an oyster shell. The smell of recent oyster shells is also an excellent decoy for ants. Small bell glasses, such as are used to strike cuttings under or small garden flower-pots, may be put over the deposit of poison, to prevent moisture from rendering it pasty, as well as to hinder any domestic animals from taking it. If small portions are laid down

* In *Sanoulli's Compendium of British Insects*, at p. 62, it is stated that the Aphides have the natural power to procreate, and that at viviparously, to the ninth generation, without sexual intercourse.

at intervals of four or six hours it will not become glutinous, in which case the ants cannot separate it. If bell glasses are used to cover the poison, any curious spectator may see the avidity with which the ants carry off the poison to feed their young. This preparation is equally efficacious for crickets.

Gentlemen and gardeners should be aware that this mercurial poison is equally fatal to vegetable as animal life. Should it be laid on the surface of the soil, round the stem of an orange tree or other plant, it will corrode the bark and albumen, to the certain destruction of the plant. This I know from experience.

Yours, &c,
W. Beck, Feb. 1831. J. THOMPSON, JUN.

From the Boston Medical and Surgical Journal.

Troublesome Bedfellows.—We were shown yesterday a bevy of (Hessian) flies, taken alive from a straw-hed. Many people suppose that they have been bitten by this kind of fly, which has caused the very troublesome humors so prevalent at this time. Several other persons have opened their beds and found myriads of this fly. The straw is of our last year's growth. In the town of Lexington we learn that every straw bed in the place was recently burnt, being found to contain the above fly. But we do believe, however, that the humor which so disfigures the faces of men has some other origin, yet unknown to physicians, and for which scarcely a single cure has been found. Though this scourge is so extensive we have seen no mention of it in the papers.

The above is from the Gloucester Telegraph, and refers to the eruption which has been so prevalent of late in this city and vicinity, and, in fact, through the whole country north of the Potomac. We can assure the Editor of that paper that the picture he has drawn is far too gloomy. We apprehend that his idea has arisen in consequence of the fact that eruptions are generally submitted to popular remedies and the prescriptions of elderly women, instead of the skill of the faculty. Where people have placed themselves under the care of their regular physicians, we have known—a few to be sure—but very few cases in which the disease has not been speedily and thoroughly cured.

Cider in the Morning.—We understand that several persons in this city were, a short time since, severely affected with colic, in consequence of drinking cider in the morning which had rested through the night in the leaden pipe and pump of Mr. Philpot. In passing through Danvers a year or two ago, we stopped at a public house, and, with our companion de voyage, regaled ourself with a tumbler of soda water from a similar fountain. The landlord had probably not made a fortune that day by the sale of his wholesome beverage, and the severe vomiting it produced in both of us was doubtless owing to the water having remained too long in contact with the leaden pipe.—*fb.*

The last number of the Library of Entertaining Knowledge treats of Insect Transformations, and contains many curious and entertaining facts.

If all our agriculturists (who are in fact the very sinews of the country) would make use of their facilities for studying into the instincts and habits of the swarming tribes around them, how much more excitement in politics and religion would be done away, and how much more abiding and satisfactory would be the benefit derived.

From the Keesville Herald.

To the Editors—In conformity to your request, the following is the result of my experiment on 51 acres plain land, situate on the high road, half a mile west of Port Kent. E. WATSON.

Port Kent, June 17, 1831.

This experimental lot lies within the race course, on the north side, in the midst of pine woods. The land is of a good quality for that species of soil, and so pronounced by Capt. Lindsey, of Saratoga county, who constructed the road from Port Kent to Keesville, in 1824. He stated to me it was much superior to the same species of land in that county; and that he, with others, had for several years cultivated it with great success and profit. From his information, I was induced to commence the experiment in 1826. In May of that year, I paid for clearing the 15 acres for the plough, \$29 September following, for ploughing, at 83

per acre, with two yoke of oxen, 45

874

In 1827, it lay in that hopeless state, and yet I pronounced it an 'experimental lot' which excited the general sneer of ridicule.

In 1828, it was again ploughed, cross ploughed and harrowed, and the greatest proportion of bushes and roots taken off, at an expense of \$35. On 3 acres, I put on 3 bbls. damaged salt, at

4,05

\$1 50, 3,00
Also, 300 bush. damaged lime, 2,00
In September, sowed the 15 acres, plastered, with rye, after soaking it 12 hours in beef pickle, containing saltpetre.

1829. In March, sowed 3 acres with red clover, on the last end, and plastered the whole at the rate of one bushel to the acre in May; received a good crop of rye; ploughed, cross ploughed and harrowed for a fresh crop and cleared off most of the roots.

1831. In March, seeded down the 12 acres with red clover, at the rate of 6 bushels of seed to the acre; early in July, ploughed in the 3 acres of clover on the east end of the lot; and in September, sowed 2 acres of it with rye and one acre of it with wheat, prepared as before; seeded it down to clover in March, and plastered the whole 15 acres in May.

1831, June 15th. The rye 5 1-2 feet high, and wheat in vigorous growth, although considerably injured by the past winter; the clover of uncommon growth for the season. Sent samples of both to Keesville and Plattsburgh for the inspection of the public, who appeared to be much astonished at my successful experiment. But they say I have incurred an expense which common farmers cannot sustain to arrive at a result so unexpected, so favorable and new in this country; although it is well known that farmers in Dutchess, Columbia and Saratoga counties have greatly enriched themselves for thirty years past by the culture of these plain plains; more productive by a judicious management of clover and plaster than the Genesee Plains, taking into view the comparative facility of cultivation.

In answer to the expense I have incurred, I can safely appeal to the above statement, with an assurance that no manure has been put on the land, nor no other course adopted but as above stated. The experiment of lime and salt, it will be observed, was on 3 acres only; its effects will be ascertained by the clover of this year.

All the expenses I have incurred since 1826 are fully met by the profits of the crops. It therefore results, that with the exception of the fences and \$6,50 for salt and lime, the extra, chargeable on the soil for the first year is \$74. It is useless to add, the public will judge for themselves. I have brought the subject fairly before them, and earnestly invite experiments, and less attention to lumber, the bane of agriculture.

From the Middleton Sentinel.

SHAKER BARN.

MR STARR—I hand you for the amusement and information of the practical farmer, a description which I have verbally received from a friend of mine, living in that vicinity, of a large barn built the last season, in the town of Hancock, Berkshire county, Mass. by the family of Shakers located in that town. It is possible, that in some points, the dimensions may be inaccurate; but you may rely that they are materially correct. Both the size and form are probably unfit for common purposes—very few farmers would wish to collect so much forage and manure, or have so much stock in one place; but all who have any experience in the business, will agree that there is much ingenuity and convenience in the design, for a large establishment.

The barn is built on ground inclining southwardly, in a perfect circle, and is ninety feet in diameter, across it from side to side. The walls are stone, 22 feet in height, of suitable thickness, and laid in lime or well pointed on each side. Round the barn, on the inner side, are stables forming a circle; the manger within and suitable places over it to throw or feed down the hay; the stable and manger occupy about twelve feet, and are eight feet high; the stables open too and from several different barn yards, in order to make as many and such divisions of their stock as they have thought proper. The covering of the stables from the barn floor, which also extend round the barn. There is but one large door way for entrance with teams and loads; this is from the northern side, from an offset or causeway, 8 feet above the base, and of course fourteen feet below the eaves. The cart or wagon that enters, with a load, makes the whole circuit of the floor and after unloading comes out at the same door; thus eight or ten teams with their loads can occupy the floor at one time, in unloading, and not hinder each other. Within this circle of stables and barn floor is an area or bay, as it is usually called which is filled with hay, &c, which must be over sixty feet diameter. This is pitched in and on from any side or place most convenient, or where wanted.

The roof comes to a point at the centre, and sheds off the rain all round, something similar to an umbrella. It is supported from the inner circle of the barn floor. The roof boards are laid up and down, which by a transverse sawing of the log were all brought to a point, and then slung round in the usual mode. M.

Swamp Mud.—Were farmers to pay more attention to draining their low lands, they would find it much to their interest. Separate from the advantage of rendering their low lands dry and productive, much manure of the first quality might be taken from the ditches, and when spread upon fallows and other uplands under tillage, would well

repay all the expense of ditching. Many seem to entertain the idea, that nothing is worth carting or spreading as manure, unless it has been collected in the barn yard, or is the excrement of animals.

All vegetable matter undergoing decomposition furnishes food for growing plants, and may be applied as manures. In short, anything, whether vegetable or animal substance, which on being mixed with a soil under cultivation, and which increases the growth of plants cultivated in such soil, is termed manure. Different soils require different substances to be applied, in order to facilitate the growth of plants; thus light sandy soils which are too loose to retain moisture are greatly benefited by the application of clay; and such earths as are comparatively too retentive of moisture, are greatly altered for the better, by mixing with them a portion of sand, so that whatever be the soil which requires ditching, the earth removed may be carted to a different soil, and be applied as a manure. There are in some farms small swamps or depressions, in which vegetable matter collects, and which cannot without considerable expense be drained; these frequently become dry during summer, when large quantities of manure might be taken out of them. Good farmers will look carefully to those things, but some that are new in the profession, may not be aware of the importance of such deposits, and a hint from us may not be considered amiss.—*Genesee Farmer.*

VEGETABLE LIFE.

The first point that should engage the attention of the enlightened agriculturist, is to ascertain the nature and situation of those minute vessels by which plants absorb water from the soil and the atmosphere, and by which these principles are modified and circulated to every part of the vegetable, and are converted into the plant itself. So minute are these vessels, that even microscopic observation has not been able to detect all their intricacies. But their general structure and arrangement have been ascertained.—And it is found that they bear a most striking analogy to those vessels of animals by which nutriment is conveyed, in ceaseless circulation to every part of the system. In every plant we find one set of small vessels, running from the roots to the extremities, through which the sap ascends, while in its progress it is undergoing those changes that will fit it for becoming a part of the vegetable.—These vessels resemble the arteries in the animal system. When the sap is thus conveyed to the leaves and other extremities of the plant, it there comes in contact with the atmosphere, gives off its redundancies, and absorbs water, and perhaps other principles essential to the plant. The leaves of plants, therefore, perform nearly the same functions as the lungs of animals. A second set of vessels, exterior to the first and mostly confined to the bark, now conveys the food of the plant, thus prepared, to every part that needs nourishment; even to the very roots from which it proceeded. These vessels correspond to the veins. Other vessels are found in plants, corresponding, probably, to those similarly situated in the animal system; yet too complicated for explanation on this occasion. Suffice it to mention, that in vegetable, as well as in animal economy we find the principle of life—itsself inscrutable—modifying and controlling every operation and keeping the wonderful machinery in ceaseless play.—*Hitchcock's Address.*

SYMPTOMS AND PROGRESS OF THE ROT IN SHEEP.

In the first stage of the rot, the sheep is in the frequent habit of rubbing the upper lip against the fold, or its own fore legs, or any hard substance; also of drinking a greater quantity of water when at the sheepfold than those that are sound, and showing a disposition rather to lick off the moisture from, than to crop the grass. In the second stage, the lips, nostrils and throat become swollen; the animal is feverish, insatiably thirsty, and almost incessantly visited by a sort of dry cough. In the third and last stage, the eyes become sunken; the eyeveins, small, discolored and nearly bloodless, the eye-balls, livid and dim, with whites exceeding pale, the burrs of the ears swollen, and free from wax; the liver, lights, and throat ulcerated; and the passage of respiration being stopped, the animal is suffocated. 'I was led to this experience,' says the writer, 'when very young in business, by an old shepherd who had been more than forty years upon the farm. Pointing to a sheep rubbing its lip against the fold, and acting otherwise in the manner above described. That sheep, master, said he is touched with the rot. The best thing I can recommend you to do with him is, to take him home before he is too far gone, give him some ground oats, and make him uddishy meat and kill him.' I did so, as sheep will thrive upon oats for some time after they are first affected; and when the sheep was opened, I discovered that the liver was full of things resembling plaice, and its lights just beginning to become ulcerated. The next sheep I found in the first stage as above mentioned, I suffered, by way of experiment, to take its chance, and it died, by suffocation in the third stage, as above stated, which was the result of at least a dozen experiments.'—*N. Y. Memoirs.*

SILK FILATURE.

We have been gratified with seeing the progress of the silk culture in this neighborhood. Mr Cobb has the silk reeled with great exactness in his own family; and several families in the neighborhood have been engaged in rearing silk worms for him this season, and as he reels all that comes, to advantage, it is probable that this useful branch of industry will be rapidly extended. We understand that when Mr C. buys the cocoons he pays from 25 to 50 cts. per pound—and that the silk as it comes from the reel fetches from 4 to 6s. per pound. Mr C. has in press a manual on the culture of silk which is to be distributed to each of the towns in the Commonwealth, at the public expense. This manual is calculated to give plain practical directions on the subject so that a person who never saw a silk worm may take it up and with proper attention may proceed in the business with advantage. He has lately introduced to his garden from New York the *morus multicaulis*—a kind of mulberry tree bearing leaves one foot in length, and which is said to be superior to all others for the nursing of the silk-worm, and which he recommends to general cultivation in the State of Massachusetts. We saw at Mr C.'s house five varieties of the cocoon. It is said that the large white cocoon, of the French insect is the most rich and ought to be preferred by the cultivator, on account of its being best for white silk; of the small Chinese worm, from four to five crops can be raised in a season. Mr C. has himself these worms now which three weeks since were in the

chrysalis of the cocoon—the moth having eaten out deposited her eggs and the eggs having hatched, the worms are now eating the leaves, and the whole has been done in the short space of three weeks. Mr C. obtained this variety of the insect from Baltimore.—*Dedham Politician.*

HIGH CULTIVATION.

It is not an uncommon complaint among farmers 'that the times are hard.' Is it wonderful that with some they are so? They are 'hard' because their crops are small, because they fail to bestow the proper cultivation upon them. Concentrated action is efficient action; and it is this only which gives large agricultural results. But to this an obstacle presents itself nearly insurmountable. Our farms are in general too extensive, and the labor of the farmer is spread over too extended a surface. And yet, instead of selling a single acre, most of our farmers covet many more. If farmers however, would thrive, they must change their policy; they must concentrate their labor; they must give to few acres the care, now usually bestowed on many; and if necessary to this, they must diminish their farms. Many an acre of corn, and many of rye now yield only 10 or 12 bushels and even less. Many an acre is mowed, whose burden—if it may be called a burden—amounts to scarcely half a ton. How much wiser—how much more grateful, to give to these acres a proper cultivation and gather bushels for pecks, and nearer tons for hundreds! This, I conceive, is, at present, the great error of our farmers generally. They adopt a diffusive, desultory mode of operation, which keeps their lands poor, and themselves poor also. The only method by which the benefits of a thrifty, productive husbandry can be enjoyed, is to change the present system for one more compressed and more vigorous. It should be written on every farm house, and in the centre of every lot, as a memento to its occupier—'Till but little, and till thoroughly.'—*Rev. Mr Goodrich.*

It has been justly said of the Farmer's occupation, that it involves as much skill, as much interest, and as much honor, as any object within the range of the attention, or the action of man. It was certainly man's first employment, and without doubt, the happiest in which he can be engaged. True he labors hard, and by the sweat of his brow earns his bread; and this is common to most vocations into which manual labor enters. But then he has his season of enjoyment, and is at all times relieved from the responsibility, anxiety, and the risk of the merchant, or the intense application and fearful solicitude of the professional man. The occupation of agriculture being more steady and less liable to the fluctuations experienced in almost every other vocation, more especially to those immediately dependent on commerce, tends to a more regular, simple, and consequently, to a more moral life. It is this favorable tendency of their habits and mode of living, which has entitled the yeomanry to that political importance, which attaches to them in almost every other, but more particularly in this country—our government being founded on equality of right, and our institutions recognising equity as the rule of conduct. The yeomanry were the instruments by which our Independence was achieved—from their bosoms the republican spirit was transfused into our political institutions—and with them by whomever assail-

ed will rest the defence of those privileges civil and religious, which we now so eminently enjoy—on their honesty, intelligence and firmness we may always rely to perpetuate the enjoyment of these privileges.—*East. Pat.*

PEACH TREES.

The observation in your 40th member, that peach trees in a pasture not tilled, are in a healthy and sound state, while those in the gardens and cultivated fields have decayed, appears to be confirmed by the following facts. In a door yard which has been uncultivated for eighteen years past (well covered with blue or shear grass, trodden hard) are six peach trees that were planted in 1809, in a healthy sound state, that have always produced remarkably well. About 20 rods from this yard, there is an orchard of peach trees that was planted the same season, has been well tilled, and every possible care taken to preserve the trees from worms, notwithstanding which, the present trees are the third generation, the first two being entirely gone. On the margin of this orchard, in the worm of the fence, are two peach trees of the first planting, in fine condition are now full of fruit. The ground about the roots is well sodded and has been so ever since they were planted. On a pasture lot with a different exposure, there are eight trees of the same age in good health. The ground has not been ploughed for twenty years. What is still more remarkable, the trees in grass ground have produced fruit in several seasons that those on tilled ground were killed by the frost. You will perhaps be surprised to learn, that I have nursed the trees in the orchard with great care, pursuing the different methods recommended to protect them from injury, without profiting by a daily view of these circumstances; yet such is the fact, in it is a striking proof of our inaptitude to appreciate the operation of nature. I shall not pretend to theorize on these phenomena, but the inference appears natural that we may have overdoctored the trees, as is sometimes the case with a learned profession in curing diseases incident to human nature. It is not improbable that the remedy has been worse than the disease.—*Western Tiller*

Strength diminished by Alcohol—The acquisition of strength is found to be only temporary; dulness, both of the passions and intellect succeeds, together with a diminution of the muscular power; a tendency to sleep ensues; and it is seen that the subsequent exhaustion is in reality proportionate to the previous excitement; in short, that the drinker, instead of increasing, has only used up his vital powers, and is now weaker than before.—Hence it is that, although spirituous liquors create a temporary energy, which may, under some circumstances, possibly enable him who drinks them to accomplish more than at another period, yet the reverse is the case in the long run; and, both as regards a consecutive series of daily labor, and the prolongation of life, alcoholic drinks are a real disadvantage. The experience of all those who have employed numerous workmen, and who have made comparative trials, is decidedly confirmatory of what we here allege. In mechanical strength, in the capability of enduring hardships and fatigue, in the force and clearness of the intellectual powers, the intemperate can stand no comparison with individuals endowed with the same natural advantages, who abstain totally from the use of ardent spirits.—*Philadelphia Med. Society Report.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JULY 27, 1831.

FARMER'S WORK FOR JULY AND AUGUST.

Mowing ground.—There are but few objects connected with the management of a farm of more importance than that of obtaining good crops of rye, after mow, or second crops of grass. If your mowing land is in such good condition that you can hope to obtain a second crop, be careful to keep it from the intrusion of cattle, sheep and horses, for rye in the winter and spring is very valuable for ewes, young lambs, cows and calves &c.

A writer in *Hunters' Geographical Essays*, recommends manuring mowing ground immediately after haying, and especially if a second crop is expected. In such case, some part of the fertilizing qualities of the manure will be lost by its being exposed to a burning sun, but the manure, when first applied, will protect the roots of the grass, and as soon as the grass has grown a little its tops will protect the manure: so that on the whole this application may not be unprofitable. Composts composed in part of loam or rich earth, are supposed to be better for manuring grass land than unmixed stable or barn yard manure; because such composts are less liable to be deprived of their fertilizing qualities by the sun, air and violent rains. Whenever manure of any kind is applied to grass land it should be spread as evenly as possible and a bush harrow should be drawn over the surface, which will break the small lumps remaining in the manure, and bring it closer to the roots of the grass. Or as Dr Deane directs, 'when the land becomes bound or mossy, so as to diminish the growth of the grass, if it be not convenient for the farmer to break it up, it should be cut or scarified by a spiked roller; or if the farmer does not possess this, by a heavy loaded harrow, when the ground is softened by rains, or by the coming out of the frost. Then dressed with some short rotten manure, suited to the soil; hushed, and a roller passed over it. There is no danger of destroying the roots of the grass by this operation. Though they are broken they will be speedily renewed, new offsets will be more plentifully formed, and the crops will rise with renewed vigor.'

Hay.—It is to be apprehended that much hay, the present season has been placed in stacks or mows without being thoroughly dried. The following extract from *Young's Calendar* may afford a useful hint in such cases. 'Mr Duckett's method of trying the heat of his hay stacks well deserves noting. He thrusts a scaffold bolt, or other stout and long iron bolt into a hay stack [or mow] to give an easy admission to a gun rod, with a strong worm at the end of it, with which he screws out a sample, and discovers not only the heat, but state of the hay; if the stack [or mow] wants air, he makes many of these holes, which give vent to the heat, and answer the purpose of a chimney.'

Weeds.—Be careful not to permit any weeds to ripen their seeds on your lands. If you have not leisure to dig them up by the roots you may cut them off with a scythe or a sickle before their seeds are sufficiently grown to vegetate. If the seeds of pernicious plants are never suffered to become ripe you will be sure eventually to destroy

them. Even the Canada thistle, which is very hard to subdue, will eventually disappear if you cut it down often enough to prevent its seeds from coming to maturity for several years in succession.

Seeds.—Select the ripest and best seeds from such plants as are most forward and vigorous, and you will improve your breed of vegetables, in a manner similar to that by which the breeds of animals are improved by the celebrated European breeders of cattle. New and improved kinds of wheat, peas, beans &c, &c, have been introduced by observing among growing crops some individual stalks, pods, ears, &c, which were distinguishable from the rest by a greater degree of health, luxuriance, productiveness, earliness, or some other peculiarity; gathering and preserving them exclusively for seed till sufficiently multiplied for propagation on a large scale.

Soiling.—This is a term applied to the practice of feeding domestic animals on new mown grass, or other green crops, in racks, yards, stables &c. Lorain says of this mode of farm management that 'The farm yard manure acquired by soiling, and that introduced by the roots of the grasses, create in the course of a single round of crops, such an immense improvement in the soil, that after the hay harvest commences, (which is great in consequence of the grass saved by this practice,) an almost perpetual harvest ensues until the corn is cribbed.'

'Each crop is heavy in proportion to the ground occupied by it. The labor greatly exceeds what would readily be imagined by those who have not observed the practice; still it may be ought to be partially introduced; especially by wealthy farmers, who have many workers in their own families. Also by those who have but little land in proportion to the labor they can readily obtain from their children, &c.'

'It should, however, be remembered, that success is not to be expected, unless a full supply of green grasses, proper for this purpose, have been provided. Also, the very great trouble and perplexity occasioned by red clover, in consequence of the cattle and horses being salivated by the second and third crops of this grass.'

'Every farmer should soil his working cattle and horses, whether he may or may not enter into the general practice of soiling. A very small extent of ground will be sufficient for this purpose. This may lie so near to his barn, that the trouble will be little more, if as much, as going to the pastures after them. The grass and rich dung saved by this practice will be very valuable to him.'

'Notwithstanding the great advantages that may be derived from soiling, it would seem that it cannot be generally practised even in the populous parts of this country. The quantity of cleared ground is more than double as much as the population is capable of cultivating properly, without introducing the additional labor which would be required if soiling were generally practised.'

VINES WELL CULTIVATED.

We were induced by report, which spoke very highly of a Garden and Greenhouse owned by Mr LEVIST, of Roxbury, to spend an hour in visiting the establishment; and found our expectations more than realized.

The grounds are beautifully situated, forming natural terraces, rising one above another, to an

eminence, from which we have a fine view of Boston, the harbor, and the adjacent country. The premises were ornamented with flowers of many hues, and species, young fruit trees, and many rare and curious plants, both natives and exotics.

We were particularly pleased with the forcing house for grapes, which though of recent construction is already teeming with the abundant and delicious products of judicious cultivation. The structure, we should suppose, was about 60 feet long, and from 12 to 15 feet wide, with a sloping glass roof facing to the southeast. The vines were planted in a trench, outside of the southern wall, through which they were introduced into the inclosure, and supported under the roof. The grapes surpassed anything we have ever seen of the kind, both in quantity and apparent quality. The clusters, when ripe, it is supposed will weigh from 1½ to 3½ lbs. each, and that the whole product will not be less than 800 lbs. on less than 700 square feet. A part of the roof, however, is lined with branches of the vines, not yet arrived at a bearing state. The vines are of different sorts, of the best quality and, we believe, all of European origin. The garden, greenhouse, hot-house, forcing-house, &c, are cultivated by Mr Russell, an Englishman, and we think that the product of his skill will give abundant proof that he is a master of his profession.

A Fruitful Vine.—A gentleman informs us that there is growing in the vicinity of Boston a wild vine 21 inches in circumference, 47 paces or 141 feet in length. That its common annual produce has been about 7 bushels of a fine white grape; but this year it has produced but about 92 lbs. in consequence of having been cut away in order to obtain scions for grafting &c.

The Viewing Committee on Farms, of the Hillsborough Co. (N. H.) Agricultural Society, offer the following premiums:

Wheat.—For the best field on old ground, not less than one acre, \$3—next best \$2—next \$1.

Corn.—For the best field, not less than one acre, \$1—next best \$3—next \$2—next \$1.

Oats.—Best, not less than one acre, \$3—next \$2—next \$1,50—next \$1.

Potatoes.—Best, not less than ¾ acre, \$3—next \$2—next \$1,50—next \$1.

Rye.—Best field on old ground, not less than one acre, \$2—next \$1.

White Beans.—Best field not less than half an acre, \$1,25—next 75 cts.

Farms.—For the farm most profitably cultivated without regard to size, \$4—next \$3—next \$2.

HAIL STORM.

Mr FESSENDEN—In haste I give you a few particulars relative to a hail storm, which occurred at this place on Saturday last.

In the morning of the 16th inst. our farmers could behold their promising fields of corn, vines, &c, with much pleasure, anticipating a rich harvest, but at noon the scene was reversed, and their hopes in a great measure blasted, in consequence of the meeting of two clouds nearly over this town accompanied with severe thunder and lightning and torrents of rain and hail. Some of the hail was nearly of the size of a small pullet's egg, and much of it of the size of walnuts. Stripping the leaves of our Indian corn in strings, and causing the leaves of our vines to resemble net

work. Pumpkins and young squashes were much bruised, and other vegetables greatly injured. The lightning struck the Methodist Chapel and set it on fire on the bellry; but through the great exertions of Mr Amos Wheeler, and Mr Benj. Dudley, the fire was put out, though the house was much damaged, particularly the bellry. No wind accompanied this shower: the hail fell perpendicularly, therefore no side glass was broken. I am informed that a barn in Groton was struck by lightning and consumed.

Yours, &c, J. WARREN.
Weston, Ms, July 22, 1831.

Boston and Worcester Rail Road.—A meeting of the subscribers to the Boston and Worcester Rail Road was held in this city on Wednesday last, for the purpose of organizing the company. It appeared that the whole number of shares, 10,000, were subscribed, and that the subscribers present voted to accept the act of incorporation and to establish bye-laws for the government of the company. The following gentlemen were unanimously chosen Directors, viz: George Bond, David Henshaw, Thomas Motley, Henry Williams, Daniel Denney, Joshua Clapp, and Nathan Hale.

BOOKS NOT INFALLIBLE.

Sir H. Davy's Lectures on Agricultural Chemistry is a valuable book; and every farmer, who reads ought to have it. But he should not follow it, or any other book, farther than the author follows nature and reason. It may be laid down as a maxim in farming that no practice can be good that is opposed to either. We may all see that favorite systems have such a powerful influence over the mind of man, that they too often cloud his understanding, and reason imperceptibly bends and becomes subservient to them.

Mode of marking Sheep without injury to the wool.—An English writer gives the following. Mark on either side of the nose of the sheep, the initials of the owner's name, and on the opposite side any number by which he may choose to designate the particular sheep, by means of a small iron letter or figure about an inch long; which being dipped in common oil colors, mixed with turpentine to dry them more readily, if placed on the part described, will continue until the next shearing season. The process is easy, and will give the animal no pain; the marks cannot be readily obliterated, which is not the case with tattooing or cauterizing.

Patent Zinc Milk Pans.

This article which has been introduced into general use among the Pennsylvania and Jersey farmers, and which is found upon trial to be superior to any other pan for the purpose intended, is now offered for sale at the Agricultural Warehouse, 52, North Market street. From actual experiment it is found that milk deposited in these kind of pans will produce an eighth part more cream, and keep much cooler than in any other way.
July 27.

30 Dollars Reward.

The above reward will be paid by the Subscriber for the detection and conviction of the vile wretch or wretches who have been base enough to break down a large number of young rock maple Trees, set out on the road adjoining his Farm, leading from Dedham turnpike to Brushhill turnpike, for the purpose of shade and ornament. As the vile wretch who could be guilty of such a crime is dangerous to the community, it is hoped that the citizens of Roxbury and Dorchester will be vigilant in endeavoring to detect him, in order that he may be brought to public justice.
JEREMIAH HILL.
Boston, July, 1831.

Lynn Mineral Spring Hotel,

Ten miles from Boston, Six from Salem, and Five from Nahant.
The subscriber most respectfully begs leave to inform his friends and the public that he continues to keep that delightful Summer retreat, the Lynn Mineral Spring Hotel, which it will be his object to render a general and pleasant resort for Boarders, Parties of Pleasure, transient Visitors, &c.

The salubrious qualities of the waters of this celebrated Spring—the beautiful lake, on the borders of which the establishment is situated, abounding with fish of various descriptions, and surrounded with the most wild and romantic scenery—splendid Boats for sailing or fishing—Bathing rooms on the margin of the lake, where the warm or cold bath may at any time be taken—the delightful situation of the House, with its comfortable and well furnished apartments, with the fruit and flower Gardens adjoining, are attractions for those in pursuit of health or pleasure, rarely excelled if equalled in any part of the country.

Every exertion shall be made to merit a continuance of that patronage which has been so liberally bestowed.
JAMES W. BARTON.
July 20.

Bees.

The Subscriber has 300 swarms of Bees for sale, in his Patent Slide Beehives, at 20 cents per pound, weight of each swarm from 40 to 100 lbs, tare of hive deducted; the price of the Patent hives is \$2 a piece, and the price of a single right \$5.

Also for sale, 200 swarms of bees in the old fashioned hive, price 17 cents per pound, tare of hive deducted. The above will be delivered within fifty miles of Boston, in good order, (warranted free from moths or otherwise damaged) by the first day of March, 1832.

All letters must be sent in before the first day of September, 1831, post paid, to the subscriber, at Brighton, Mass. so as to have time to transport them from Maine.

N. B. The weight of the above hives will be taken in September.
EBENEZER BEARD.
July 6 ep2m

Medical School in Boston.

The Medical Lectures of Harvard University delivered in Boston will be commenced in the Autumn, at the usual period, viz. on the third Wednesday in October. They will be continued four months.

This extension in the term of the Lectures has been thought necessary to afford time for such a course of instruction and demonstration, as is deemed by the Faculty to be requisite, under the advantages which have recently accrued to the School.

The Legislature of Massachusetts, with an enlightened liberality, which does honor to our age and country, have extended the protection of law to the cultivation of Anatomy within this Commonwealth. The advantages which will hence result to students resorting to this school will be sufficiently obvious. It will be the aim of the Professors to carry into effect the intentions of the Legislature, in such a manner as to evince at the same time their respect for the rights of humanity, and their interest in the promotion of the healing art.

The opportunities for practical instruction at the Massachusetts General Hospital continue undiminished.

The course of Lectures will be—

On Anatomy and Surgery, by Dr Warren.

“ Chemistry, by Dr Webster.

“ Materia Medica, by Dr Bigelow.

“ Obstetrics and Medical Jurisprudence, by Dr Channing.

“ Theory and Practice of Physic and on Clinical Medicine, by Dr Jackson.

WALTER CHANNING.

Dean of the Faculty of Medicine.

Boston, June 15, 1831. 6t July 16

Cocoons Wanted.

The Subscriber will pay cash 1st Cocoons, from 25 to 50 cents, according to quality.
J. H. COBB.
Dedham, July 15th, 1831. 8t July 20.

Wanted.

A young woman from the country, from 18 to 31 years of age, who is neat and faithful, may hear of an excellent situation to do the ordinary work in a small family, (who reside in the country during the summer,) where she will receive good treatment and the highest wages. Also wanted in the same family, a young girl from 14 to 16 years of age, to take care of children. Apply at the Farmer office, 504 North Market street. July 20.

Ammunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded if Jan.

Lightning Points.

Just received, a further supply of Treble Gilt Lightning Points, and Glass Blocks, which are for sale at the Agricultural Warehouse, 52, North Market street.

Cultivators and Ploughs. For sale at the Agricultural Warehouse, Expanding Cultivators, Howard's improved Ground Mold Board Ploughs, different sizes. July 20.

BRIGHTON MARKET—Monday, July 25.

[Reported for the Chronicle and Patriot.]

At Market this day 377 Beef Cattle; 16 Cows and Calves, 784 Sheep. 55 Beef Cattle remained unsold at the close of the market.

PRICES.—Beef Cattle—Cattle went off rather slow and at reduced prices, particularly on thin cattle; we quote from \$1 25 to 5 50.

Cows and Calves.—We noticed the following sales only: \$20, \$21, \$23, \$25.

Sheep and Lambs.—Sales quick at about 1st week's prices. We noticed lots at 1 87 $\frac{1}{2}$, at 2 00, at 2 12 $\frac{1}{2}$, at 2 25, at 2 33, and at 2 50. A few old sheep were taken at about 3 50.

MISCELLANY.

HINTS FOR HEALTH.

Persons in health should never under any circumstances take medicine. The custom which prevails in some families of administering physic in the spring and fall to prevent the attacks of disease, is preposterous in the extreme. The only sure safeguards are temperance in eating and drinking, and carefully adapting the clothing to the changes of the atmosphere. Persons in the vicinity of contagious disorders, must carefully attend to these prescriptions, and by proper exercise, cheerful recreation and strict regard to cleanliness, preserve the mind in a state of cheerfulness and activity. It is absolutely necessary for those visiting warm climates to abstain entirely from the use of spirituous liquors. The great cause of the mortality among our seamen visiting the West India Ports, may be traced to the prevailing use of liquors, which heat the blood and induce fevers in those warm climates. One sick person only should occupy the same apartment. The bed should be a mattress, in case of fever, in preference to feathers. The room should be well ventilated, the light excluded, and it should be kept in a state of perfect cleanliness. The introduction of visitors, in a sick chamber should always be avoided as the air becomes vitiated and unfit for respiration, and their presence and conversation, are apt to disturb the patient. The room of the sick should always be kept quiet and free as possible from all noise and talking.—*Catechism of Health.*

From Basil Hall's Voyages and Travels.

From what I saw of Madeira during many visits at different seasons of the year, I had long been of opinion, that this delightful island formed one of the best, if not the very best places in which a consumptive patient might hope to find a cure—or rather, to which a person having a consumptive tendency might resort in hopes of preventing the fatal access of a disease which, at certain stages is but too well known to be beyond the reach either of climate or medical skill. I was not aware, however, till lately, how completely this idea of the superior advantages of Madeira was borne out by the opinion of the best qualified professional men, especially by Dr James Clark, whose very interesting work, on the Influence of Climate in the Prevention and Cure of Chronic Diseases, may be consulted with great advantage on this subject.

One poor passenger's case was precisely one of those which, had this work been published twenty years sooner, would never have been referred to Madeira for a cure. Of comforts, indeed, she had no want; for she was received into the house of one of those splendid persons, the great English Madeira merchants, who, with a sort of oriental hospitality and luxury, in character with their happy climate, used to fling their doors wide open to receive strangers coming to the island. In those days, there was great difficulty in procuring good lodgings; but I am told that accommodations for families or for single persons, may now be hired by those who have not the advantage of such introductions, or who are unwilling to encumber these most hospitable of men with the anxious companionship of invalids.

Most, if not all the merchants have two houses—one, of course, in the city, where their business is transacted—another lying beyond the noise and bustle of the Port. Many of these gentlemen reside occasionally at their country seats, the side of the mountain which takes its rise from the beach at the town of Funchal, and rises with a steep face to the height of many thousands of feet above the sea. The upper parts of all are so lofty, that no vegetation finds root upon them;—

and although there be no coating of perpetual snow, I believe ice may be found, at all seasons, in the crevices which surround the well known Caldeira, cauldron or crater, near the summit. Be this as it may, I am sure that by going up the hill or coming down it, a range of many degrees of the thermometer may be commanded. So that, if the taste of an infirm person, or the peculiarities of his complaint, require a heat of 60° or 70°, he may live as long as he pleases in a climate that is best suited to his recovery.

The medical gentlemen resident on the spot, reprobate in strong terms the intuity, not to say crassity, of sending our patients in the advanced stages of consumption. "Generally speaking," observes Dr Renton of Madeira, as quoted by Dr Clark, "the poor patient himself has nothing to do with the arrangements; and it is principally in obedience to medical advice that he undertakes a voyage productive of nothing but mischief and disappointment. So uniform is the result of this practice, that the annual importation of invalids from England is thought a fit subject for ridicule, amongst the boatmen, on landing these unfortunates on their island. 'La rai mais ham Inglez a L'orangeira'—there goes another Englishman to the Orange tree!—such being the name of the burying ground of the Protestants."

Dr Clark gives a table, from which it appears, that of 17 cases of confirmed consumption, no fewer than 22 died within six months after their arrival at Madeira; while out of 35 cases of incipient consumption, or of those wherein there was merely reason to dread this disease, 24 were cured, or at all events they left the island much improved.

The same authority, Dr Renton, long a resident at the island in question, further remarks, that when consumption has proceeded to any considerable extent, he should consider it the duty of a medical attendant not only not to advise the adoption of such a measure, but most earnestly to dissuade from it those who, from hearsay evidence of the recovery of persons in circumstances similar to their own, may feel disposed to fly to it as a last resource.

Madame de Genlis relates the following anecdote of her residence in Berlin:

"My saloon had two doors: one opening into my chamber, and the other conducting to a private staircase descending to the court; on the platform of this staircase was a door opposite to mine, belonging to the apartments of an emigrant. This man was of a savage disposition, and never saw any one in his house. Some one had given me two pots of beautiful hyacinths; at night I placed them on this platform between my neighbor's door and my own. In the morning I went to take them again, and had the disagreeable surprise to see my beautiful hyacinths cut into pieces, and scattered around the pots which held them. I easily guessed that my neighbor was the author of the deed, who had been excited to it, doubtless, notwithstanding his French politeness, by the libels, which were published against me. Not wishing the affair to be known, I did not ask more flowers of the persons who had given me these; but directed a servant to buy me some. Having placed these in the pots, I attached to them a slip of paper, on which I wrote these words:—*Destroy my works if you will, but respect the works of God.*" At night I placed them on the platform—in the morning I went with eagerness to see what had been their fate. I saw with great pleasure that some one had been content with simply watering them; I carried them immediately into the saloon, and placing them on the table, perceived that there were attached to them two silk strings, each having a charming cornelian ring. The emigrant, apparently kind, that I was then making a collection of *bijouterie*, and wished to repair his wrong in this manner. I was much touched with this proceeding, which divested me of all rancor."

A Fairy land or new El Dorado.—The streams in the Huron country, says the Rochester Advertiser glide over pebbles of cornelian, topaz, jasper, agate,

opal and quartz and are as pure as crystal. They are cool enough for drinking in the hottest day in August. The great lead-mines are in the southern parts of this district. They have been wrought but three years, by comparatively few persons, and under every possible disadvantage; yet nearly thirty million pounds of lead have been made there. Only about a mile square of surface has yet been opened, and from this thirty million pounds more might be extracted without opening a new mine. The whole of the lead district occupies a surface one hundred miles square including, however, a district of copper ore about twenty miles long, and four or five broad. The climate is fine and pure, and the soil of the prairies is admirable for grain. Among the curiosities is a sort of *vegetable compass*, the *rosin weed*, from the positions of whose leaves it is said that the north and south points can be ascertained.

Ferocity of the Panther.—An instance of unparalleled ferocity in this frightful animal, occurred a short time past in the upper part of the country. The circumstances, as we learn them are these:—A gentleman, with three negro men and several large dogs happening to be in the woods, discovered the carcass of a deer, concluded to take a part of it in order to feed the dogs. Having done so, and being on their way home, they were surprised at the approach and ferocious attack of a panther. Being unarmed, the combat liked to have been fatal to some of the negroes; but at length victory declared in favor of the gentleman and his valiant army, and they left the common enemy on the field of battle supposed to be dead. The next morning they returned, with a view of depriving their fallen enemy of his skin, and exhibiting it as a trophy of their victory; but to their astonishment the panther was absent.—The dogs soon after took his track, and in a short time overtook him, when the wily foe, regardless of his less noble pursuers, immediately attacked the men; but they being armed, succeeded, after a desperate engagement, in conquering him a second time after he had again resuscitated, they took the precaution of depriving him of his hide.—*Benton Mississippiian.*

Longevity.—Belshan's Chronology informs us that 21 persons who had attained the age of 120, and upwards, died between the years 1790, and 1826; of these, one was aged 106. In the same period 84 had attained the age of 120, and not 130. The number who attained the age of 110, and not 120, was 29 in the same space. And those who died after the age of 100 and not 110, was 24 within the period. Of the whole number recorded, 64 were natives of England, 23 of Ireland, and 12 of Russia!—Doubtless, many more have died after the age of 100, but no more have had their names recorded.

True prudence is to see from the commencement of an affair what will be the end of it.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

If no paper will be sent to a distance without payment being made in advance.

AGRICULTURE.

(From the Monthly American Journal of Geology and Natural Science.)

INFLUENCE OF CLIMATE ON THE FRUITFULNESS OF PLANTS.

The cultivated plants yield the greatest products near the northernmost limit in which they will grow.

I have been forcibly impressed with this fact, from observing the productions of the various plants, which are cultivated for food and clothing in the United States. The following instances will go far to establish the principle, viz.

The cotton, which is a tropical plant, yields the best staple, and surest product, in the temperate latitudes. The southern parts of the United States have taken the cotton market from the East and West Indies, both as regards quantity and quality. This is partly owing to the prevalence of insects within the tropics, but principally to the forcing nature of a vertical sun. Such a degree of heat develops the plant too rapidly—it runs into wood and foliage, which becomes injuriously luxuriant; the consequence is, there are few seed pods, and these covered with a thin harsh coat of wool. The cotton wool, like the fur of animals, is, perhaps, designed for protection: and will be thick and fine in proportion as the climate is warm or cold. Another reason is to be found in the providence of the deity, who aims to preserve races rather than individuals, and multiplies the seeds and eyes of plants, exactly as there is danger of their being destroyed by the severity of the climate, or other causes. When, therefore, the cares and labors of man counteract the destructive tendency of the climate and guaranty their preservation, they are, of course, more available and abundant.

The flax plants, flax, hemp, &c., are cultivated through a great extent of latitude; but their bark, in the southern climates, is harsh and brittle. A warm climate forces these plants so rapidly into maturity, that the flax does not acquire either consistency or tenacity. We must go far north in Europe, even to the Baltic, to find these plants in perfection, and their products very merchantable. Ireland is rather an exception as to latitude; but the influence of the sun is so effectually counteracted by moisture and exposure to the sea air, that it is always cool; hence the flax and potato arrive at such perfection in that region.

It holds equally true in the farinaceous plants. Rice is a tropical plant; yet Carolina and Georgia grow the finest in the world, heavier grained, better filled, and more merchantable, than any imported into Europe from the Indies. The inhabitants of the East Indies derive their subsistence almost exclusively from rice; they must be supposed, therefore, to cultivate it with all skill and care, and the best contrivance for irrigation. Such is, however, the forcing nature of their climate, that the plant grows too rapidly, and dries away before the grain be properly filled. Indian corn, or maize, if not a tropical plant, was originally found near the tropics; and although it now occupies a wide range, it produces the heaviest crops near the northern limit of its range. In the West Indies it rises 30 feet in height; but with all that gigantic size, it

produces only a few grains on the bottom of a spongy cob, and is counted on only as rough provender. In the southern part of the United States, it reaches a height of 15 feet, and will produce 30 bushels to the acre; in the rich lands of Kentucky and the middle states it produces 50 or 60 bushels to the acre, but in New York and New England, agricultural societies have actually awarded premiums for 150 to the acre, collected from stalks only seven feet high. The heats of a southern sun develop the juices of this plant too quickly. They run into culm and blade, to the neglect of the seed, and dry away before fructification becomes complete.

Wheat is a more certain crop in New York, the northern part of Pennsylvania and Ohio, and in the Baltic regions of Europe, than in the south either of Europe, or America. In the north, snows accumulate, and not only protect it from the winter colds, but from the weevil, Hessian fly, and other insects that invade it; and in the spring it is not forced too rapidly into head without time to mature fully, and concoct its farina.

A cold climate also aids the manufacturing of flour, preserving it from acidity, and enables us to keep it long, either for a good market, or to meet scarcities and emergencies. Oats grow in almost every country, but it is in northern regions only, or very moist or elevated tracts, that they fill with farina suitable for human sustenance. Rye, barley, buckwheat, millet, and other culmiferous plants, might be adduced to illustrate the above principle; for all their habits require a more northern latitude than is necessary to their mere growth.

The grasses are proverbially in perfection only in northern and cool regions, although they will grow everywhere. It is in the north alone that we raise animals from meadows; and are enabled to keep them fat, and in good condition, from hay and grass alone, without grain. It is there the grasses acquire a succulence, and consistency enough not only to mature animals, but to make the richest butter and cheese, that contribute so much to the tables of the luxurians. The grasses which do, often, in the south, grow large enough, are without richness and nutriment; in hay, they have no substance; and when green, are too watery to fatten animals; the consequence is, most animals in those latitudes brouse from necessity, and are poor, and without size or beauty. It is the same hot sun, which forces them to a rapid fructification, before they have had time to concoct their juices. The sugar cane produces, perhaps, better where it never seeds, than in the tropics; for the juices will never ripen so as to granulate, until checked by frost or fructification. In the tropics, the cane grows, twenty months before the juices ripen, and then the culm has contracted a woolly, fibrous quality, to such a degree as to resist the pressure of the mills, and yield but little juice, and that to an increased effort. In Louisiana we succeed well with the sugar culture; because, while the culm is succulent and tender, a white frost checks the growth, ripens the juices, and in five months gives us a culm, tender, full of juice, easy to press, and yielding much grain of sugar. When Louisiana, therefore, acquires all the necessary skill, she will

most probably grow this article cheaper than the West Indies.

Tobacco is a southern plant, but there it is always light and chaffy; and although often well flavored, it never gains that strong narcotic quality, (which is its only peculiar property,) unless you grow it as far north as Virginia. In the south, the heat unfolds its bud or germ too soon, forces into full expansion the leaf, and drives it to seed before the narcotic quality can be properly elaborated. We may assert a general rule applicable to all annual plants, that neither the root, nor the leaf, acquires any further size or substance after fructification.

The tuberose, bulbous, and other roots, cultivated for human and animal subsistence, are similarly affected by climate, and manifest habits in corroboration of the above principle. The Irish potato, although from or near the tropics, will not come to perfection but in northern or cool countries, or in moist, insular situations, as Ireland. It is in such climates alone, that its roots acquire a farinaceous consistence, and have size, flavor, and nutriment enough to support, in the easiest way in which they are susceptible, animal life. In the south, a forcing sun brings the potato to fructification before the roots have had time to attain their proper size, or ripen into the proper qualities for nourishment. In Ireland the plant grows slow, through a long and cool season, giving time for its juices to be elaborated, and properly digested; hence that fine farina and flavor which characterize them. The sweet potato produces larger, better flavored, and more numerous roots in Carolina, where it never flowers, than in the West Indies. In the latter place this plant runs wild, covers the whole face of the earth with its vines; and is so taken up in masking foliage, that the roots become neglected, and is small and woody. In order to have the onion in perfection, it must grow through two years, swelling all the time its bulbs. In the south, however, it seeds in one year, and before it has made much bulb. Beets, carrots, parsnips, turnips, radishes and other roots, are equally affected by a hot sun, and scarcely worth cultivating far to the south. They all fructify before they have formed perfect roots and make foliage at the expense of their bulbs; hence they will always be articles of commerce; the south will have to depend upon the north for them.

The salad plants are in like manner affected by the climate, and give further proofs of our assumption. Cabbages, lettuces, endive, celery, spinach, plants whose leaves are only eaten, to protect their germs from cold, (through a kind of instinct,) wrap them up in leaves, which form heads, and render many of their other parts tender and crisp for use. These leaves, thus protected, are not only tender, but more nutritious, because their growth has been slow, and their juices well digested. In the south, a relaxing sun lays open the very buds of such plants, gives a toughness and thinness to the leaves, and they are too unsubstantial for animal support, because of such quick and rapid development.

The delicious and pulpy fruits are, in a still more striking way, illustrative of our principle. The peach, nectarine, plum, apple, cherry, currant, gooseberry, apricot, and many other such families,

are not in perfection in the south. It is in Pennsylvania, Virginia, Maryland, Jersey, and in the north of Europe, that we enjoy them, although, originally, they came from places near the tropics. The peach of the Carolinas is full of larvæ, gum, and knots, and too stringy and forced to be juicy and flavored. The apple of the south is too acerb to be either eaten or preserved. The plums, apricots, cherries, currants, gooseberries, &c. will not even mature until we go far north. All the trees which bear these delicious fruits will grow luxuriantly in the south, make much foliage and wood, with but little pulp, and that unsavory. The kernel in one seeded fruit, seems to be the first object of nature in southern climes: that becomes strong, oily, and enlarged; and one of the peach family has so entirely neglected the pulp, that it has only a husky matter around the kernel, as the almond. The changeableness of the weather in the south, in the spring season throws plants off their guard; the frosts attendant on those changes, destroy the young fruit; and it is only once in three years that the crop hits at all. The desiccated and dried state of these fruits enables us to enjoy them through the year; but in the south, their acidity carries them into fermentation or decomposition before they can be divested of their aqueous parts. The climate of the south is equally against converting them into cider, or any other fermented liquor, because the heat forces their compressed juices so rapidly into an active fermentation, that it cannot easily be checked until it passes into vinegar. For the same reason distillation goes on badly in hot climates, and cannot be checked long enough at the proper point to give much alcohol; and whether we aim to enjoy the delicious freshness of these fruits themselves, sip the nectarine of their juices, refresh ourselves with their fermented beverage, stimulate our hearts with their brandies and cordials, or feast through the winter upon the dried or preserved stores of their fruits, we are continually balked by the severity of a southern climate, and for such enjoyment must look to the north.

The melons are always affected by too great a degree of heat, even though their vines flourish so much in southern latitudes. The forcing sun hurries them on to maturity before they have attained much size, or acquired that rich saccharine and aromatic flavor for which they are so much esteemed. The cantaloupe melon will rot, or have its sides baked by a hot sun, before it is fully formed; and the watermelon is always woody, dry, and devoid of its peculiar sweetness and richness in the south. Vines have been known to run 100 feet, and bear no melon. It is in Philadelphia and its neighborhood, and in similar latitudes, that the markets are loaded with delicious melons of all sorts, whose flavor so much refreshes and delights us. It is there, near their northern limit, that we cultivate them with such uniform success.

The orange, strictly a tropical plant, is more juicy, large, and delicious, at St Augustine, (Florida), than at Havana; and fruiters, in order to recommend an orange, will say that it is from some place out of the tropics. In the West Indies, the pulp of the orange is spongy, badly filled with juice, and has too much of a forced flavor to be pleasant. The hot house forcers of Europe, or at Rome, anciently, at first produced bad fruit; too dry, too small, and without flavor; because they overacted. They have lately found out that fact, and now the productions of the hot houses of London, Paris, &c. astonish and delight us with the quantity

and excellence of the fruit. They have found out that gradual and uniform heat is the desideratum; countervailing the cold, rather than imparting much heat. Fruit thus produced, is pronounced better than any grown in the natural way, however perfect the climate.

The juices of the grape are best matured for wine near the northern limit of their growth. On the Rhine in Hungary, the sides of the Alps, and in other elevated or northern situations, the wine is strongest, richest and most esteemed. The French wines rank before the Spanish and Italian; and in no southern country of Europe or Africa, except Madeira, where elevation makes the difference, is the vine in much repute. The grapes of France are more delicious for the table than those of Spain or Madeira. In the southern part of the United States, the excess of heat and moisture blights the grapes to such an extent, that all attempts have failed in its cultivation. The grape vine, however, whether wild or cultivated, grows there very luxuriantly. The vinous fermentation can also be best conducted in a climate comparatively cool; and all the pressing, fermenting, and distillation of the juice of this delicate fruit, can be safer and more profitably managed in a mild region.

The olive, and other oleaginous plants, yield more fruit, of a richer flavor, and can be better pressed, and the oil preserved, in a mild climate. In France the tree is healthier, and the fruit and oil better than in Spain or Italy; and the Barbary states are known to import their oil from France and Italy.

Many other plants might be named, whose habits would equally support our position. It is presumed, however, that enough has been cited to call the attention of philosophy to this curious subject, and enable us to give proper attention to it, in all the practical operations of agricultural pursuit. Much time and expense might be saved, and profits realized, if this were more generally understood.

We have already observed, that the heat of the sun in southern climes forces plants to a false maturity, runs them on too rapidly to fructification, and renders dry and woody the culms, stalks, and leaves of the plants, where these parts are used. Hence the chaffiness of the leaf, the dryness of the culm, the lightness of the grain, and the unsavory spongy quality of the pulp of the plants in those latitudes. Hence the difficulty of fermenting their juices, distilling their essences, and preserving for use the fruit, juice, or blades of such plants. The prevalence of insects is another bar to the productiveness of southern plants; swarms of them invade and strip the leaves, bore the fruit, and lead to blight and decomposition; and just in proportion as the labors of man have rendered plants succulent, and their fruits and seeds sweet and pleasant, do these insects multiply on them, devour their crops, and defeat the objects of husbandry.

The labor of man too is more conservative in northern climates, because his arm is better nerved for exercise, his health and spirits more buoyant; and instead of saying, 'go and work,' he says, 'come and work;' treads with a cheerful heart upon his own soil, and assists in the cultivation, collection, and preservation of his own. It is in temperate climates that man can be most familiar with nature; it is there he has the best opportunities of observing the guarantees which nature

has for the preservation of her animals and plants against the devastation of the elements; he sees an occasional apparent neglect of individuals, but a constant parental care of races. In everything he sees the wisdom and benevolence of God. W.

FOR THE NEW ENGLAND FARMER.

FARMERS AND FARMERS' DAUGHTERS.

MR FESSENDEN—I observed in a late number of your N. E. Farmer, an extract from the Christian Examiner, on the 'mortgaged farms of New England.' I have long been perfectly aware of this difficulty that our farmers and mechanics are laboring under,—an appalling amount of pecuniary obligations;—and that 'debt, universal debt, will meet us, wherever we turn our eyes.' After noting this calamity, the Examiner goes on to say—'Now, there are several causes to be assigned doubtless, for this extraordinary state of things; but one distinct and prominent cause unquestionably is to be found in that state of political equality which we are considering. It creates a large unproductive class, in the female members of innumerable families in the country. The daughters of our substantial farmers, (as they are called) cannot go out to service; it would be a degradation, as they would deem it. Meanwhile, the cheapness of the fabrics sent out from our manufactories puts an end to the labors of the loom and the distaff. Spinning and knitting are absolute toils. And the labors of only one or two can contribute anything to the support of the family.' &c. &c.

The delineation of the evil is correct, and it is an evil that we should all understand; but let us be permitted to hope that the causes of this growing calamity are not so well understood by the eloquent writer, as its character and extent. As republicans, and in a professedly republican community, the only causes that are suggested, if admitted to be at the root of the evil, lead us to alarming reflections. They are, as noted by the writer, the state of 'political equality' which pervades this community, creating a large unproductive class in the female members of innumerable families in the country;—and, as a consequence of this political equality, the circumstance that 'the daughters of our substantial farmers (as they are called) cannot go out to service.'

It is true that even in our favored land, political equality is talked about, as we would discourse of the millennium, and accounted rather a subject of hope than of present fruition,—yet so far from avoiding it, we are most grievously at fault, if the grand aim of the founders of our government, was not the nearest practicable approach to political equality, or if it does not continue at this day, to be the dearest object of pursuit to every sincere friend of his country, or of the human race.

The proportion of our community who are prepared to receive the daughters of our substantial farmers into their kitchens, is probably not considerable enough to save us, should the young ladies conclude that it is their duty to 'go out to service.' The number of families in New England, who by successful industry, by good luck, or possibly by fraud, are in a situation to make hewers of wood and drawers of water of their less fortunate sisters and brethren, is undoubtedly much larger than any man who loves his country, and understands its true interests, could wish,—yet it is scarcely one to fifty;—and the suggestion of saving the

land from an evil of such widely-spread and increasing magnitude, by subjecting a few individuals from among the most interesting portion of our community to a degrading servitude, where their spirits must be broken, and their morals depraved, reducing them frequently to such a degree of wretchedness that their best friends have reason to thank God when the grave closes over them,—must have originated in a very limited view of the subject,—to say nothing of that reckless barbarity which leads even good men and good women to embrace any means of relieving themselves from the salutary labor of performing their own domestic offices, without reflecting upon the consequences to a depressed and degraded fellow-creature.

We say, not one in fifty, but it is surely short of the mark to say that not one in ten, of the farmers' daughters in New England could find employment, if so disposed, in a rich man's kitchen,—yet it is frequently thrown in the unfortunate yeoman's teeth, that trouble has fallen upon him because his daughters were too proud to go out to service.

But upon those who are not in the habit of considering that all God's creatures are made of the same clay,—who are unwilling to wait upon themselves, and are therefore under the goad of necessity, so far as it relates to what is called *good help*, no general reasoning will operate, they require an *argumentum ad hominem*, that I have no disposition at this time to apply.

Being in the same situation with thousands of my fellow-citizens, it is natural that I should consider their interest as my own. I feel as deeply as any man can feel for the farmers of New England, for their exemplary wives, and lovely daughters, and with the blessing of God, my small ability shall never be wanting to save them from the sorry employment of gathering crumbs from the rich man's table.

I have daughters that I am endeavoring to bring up in industrious habits.—It is my intention that they shall earn a subsistence by such suitable employment for females, as may be found upon a farm and about a farm house. To speak plainly, I mean that they shall *work for their living*, believing that it is the duty and happiness of every member of this republic to do so. I love my children; I am happy, yes, I am proud to see them earn their bread by honest labor; yet if I know my own heart, I would sooner, infinitely sooner, follow my daughters to the grave than see them *'go out to service.'* There are indeed many excellent females who are driven to this necessity, who go through the fiery trial with credit, and maintain a character of unblemished integrity; yet who will venture to describe the distress, the anxiety, the sickness of heart, the anguish of a wounded spirit, that the most favored of them are constrained to endure.

From the view that we have taken of the subject, it must be evident that that if no other employment for farmers' daughters could be found, that becoming menials would be as a drop to the ocean towards relieving the universal embarrassment that has been described. But I challenge contradiction when I assert, that our farmers' daughters who remain under their parents' roofs, do more for themselves and more for their parents, as well as more for the prosperity and happiness of society, than any equal number of females who are employed, whether from choice or necessity, in a servile capacity abroad.

A little sensibility upon this subject may perhaps be excused in a father; but I trust that I have not offered a sentiment to which the heart of every industrious farmer in New England will not respond. We are willing to work, our wives are willing to work, our daughters are willing to work,—but spare us, if it may be permitted, spare us the imputation of performing the servile offices, and living in the kitchens of our more fortunate neighbors.

Relative to that only legitimate and faithful parent of our ruinous debts and mortgages, the *excessive accumulation of property in the hands of a limited number of individuals*, facilities for which are daily multiplying, and against which nothing but the feeble voice of the afflicted has hitherto been opposed, I have much to say, and shall endeavor hereafter to awaken my brethren throughout the country to the necessity of devising some efficient remedy.—In the meanwhile permit me to recommend to their perusal the excellent address of Mr. ALLEN, to the farmers of Franklin, Hampshire, and Hampden, an extract from which your readers have been already favored with. It is to him,—to our venerable and highly respected friend the *'ROXBURY FARMER,'* and to men like him,—of sound discretion, clear heads, pure hearts, and benevolent intentions, that the people may look with safety for good counsel, under every emergency. I have thus been reluctantly drawn to comment on some of the evils that afflict us as a people, and they must not be glossed over nor forgotten,—yet we should indeed possess unthankful hearts, could we look round upon all the blessings which have been showered upon our country, without gratefully acknowledging that we have, on the whole, been favored beyond every other people, and every other land.

A FARMER.

WORCESTER CATTLE SHOW.

The Committee of Arrangements for the approaching Cattle Show and Exhibition of Manufactures by the Worcester County Agricultural Society, would respectfully solicit the attention of the farmers of the County to the list of the premiums offered for that occasion. The Trustees of the Society, for the purpose of exciting a greater degree of emulation, have added to the number of the premiums for stock, in the hope that the owners of choice animals will be disposed to offer them at the Exhibition. It will be found, by reference to the printed bills, that two additional premiums have been offered for bulls—four premiums, in addition to those of last year, are now proposed to be given for heifers—three premiums have been added for steers—one additional premium is offered for merino ewes, and one for weaned pigs. For fat cattle, the amount of the premiums has been increased and an additional premium offered. The Trustees have not been unmindful of the claims of the dairy to public attention, and they now propose to give four premiums for butter and four for cheese, instead of two as in former years.

In consequence of the omission of the Massachusetts Agricultural Society to have a Show the present year, it has been the intention of the Trustees of the Society of this County to make their exhibition as interesting as is possible and they have appropriated a large proportion of the disposable funds of the Society, to the benefit of the growers of stock, the Committee confidently expect, that from the increased number of the

animals offered for the Exhibition, and the improved appearance of their Show, there will be found to have been no mistake in this calculation.

JOHN W. LINCOLN, Chairman.

The Trustees of the Worcester Agricultural Society have made all the preliminary arrangements for their Annual Cattle Show, which is to take place on Thursday, the 20th day of October next. An efficient Committee of Arrangements has been selected, the Judges of Stock, &c, appointed, and a gentleman who has on one occasion by invitation of this Society, and on several other public occasions, amused and instructed highly gratified audiences by the productions of his talented and well cultivated mind, has consented again to favor the Agricultural Society with an Address on their next anniversary.

This Society is in a very prosperous situation having funds at interest to the amount of more than six thousand dollars; and has enrolled among its members, a large proportion of the *Bone and Sinew* of the County. But there are many Farmers and Mechanics and other good citizens, who have not yet obtained diplomas of membership, although it cannot be doubted, that they wish for the prosperity of the Institution. The Trustees have frequent meetings for the admission of members, and any person wishing to join the Society is requested to send his name to the Recording Secretary, and he will be proposed at the next succeeding meeting. It is earnestly desired that all who have not yet become members, will soon avail themselves of the opportunity of connecting themselves with the Society.—*Mass. Spy.*

CIDER.

The orchards are bending under the weight of apples and the time of making cider is near at hand. The general process is understood, but attention to two or three particulars, may greatly increase the value of the liquor. Why does Burlington cider bring, in market, double the price of that made elsewhere?

Use water freely in making everything sweet and clean before you begin—but very sparingly afterwards.

Put your apples after being gathered for a few days in a dry place, exposed to the sun.

Let your casks be perfectly sweet.

See that the straw used be clean and bright. Throw all the rotten, or rotting apples to your pigs. Keep the several sorts of apples separate; if ground together the cider will not be so good.

When the liquor has undergone sufficient fermentation to throw off the impure matter in it, and while it is yet sweet, take a clean cask, put into it a bucket of cider, set fire to a clean rag that has been dipped in brimstone—let it burn inside the cask so as to fill it with the fumes of the brimstone—shake the cask well and then fill and bung it tight.

This mode is highly recommended to preserve the cider sweet, while it will yet be pure. The crab apple should be more extensively cultivated for cider. Liquor, as delicious as wine may be made from it.

To prevent the Depredations of Weevil.—Whoever will take the trouble to gather Elder stalks and leaves, and put plenty of it among their wheat while mowing it away, will find it in a state of preservation at threshing time.—*Western Tiller.*

MELONS.

There are but few people who are not fond of good Melons, and yet many neglect to raise them. The finer sorts of Muskmelons, such as the Minerva, Citron, Pine-Apple, and Green Nutmeg, are wholly unknown to most of our farmers, and even many of our gardeners say that they cannot be raised in this latitude in perfection, without the aid of artificial heat. Now this is altogether a mistake. We have seen them as fine in size and flavor, raised in this neighborhood, as in any part of the world. There are many reasons why people have the impression, that good melons cannot be raised in this section. First—very few have taken the trouble to obtain good seed, and when they have, a smaller number are acquainted with the best method of training them, and the consequence has been, that the melons did not ripen until late in the season, when the weather had become cool, and there was not that relish for them, that would have been, had they ripened during the warmer part of the season: for we can readily conceive that a watermelon at Christmas, would be very much out of place. To ripen melons, early in the season as possible is desirable. For this purpose, those who have it in their power, can hasten their maturation one month, by planting them in a hot bed; but as this is not always convenient for farmers, we will speak of their treatment in open ground. In the first place, be careful in the selection of seed. Those with green flesh, are of the finest flavor, but do not ripen as soon by a couple of weeks, as some of the coarser kinds, with yellow flesh. The green Nutmeg and Citron, perhaps, are in as great repute for flavor as any, though they are very small, but their exquisite flavor compensates for their want of size.—Most of our vines, as the Pumpkin, Cucumber and Melon, thrive best in new strong soils, but the watermelon, on coarse land, made rich, as heat is indispensably necessary to their perfection, and such soils become much hotter than those that contain large portions of vegetable matter. By the term new, we mean grounds that have lain in grass, and not that from which the timber has been lately removed. All have noticed how much better Pumpkins thrive in cornfields, the first year after breaking up the sward: therefore, in planting melons in gardens, if a wheelbarrow load of such soil is placed for each hill, mixed with a suitable quantity of manure from the hog pen, it will repay the expense, as in that case, they are not liable to be destroyed by insects in the roots. The ripening of the fruit may be advanced nearly two weeks, by nipping in the leading vines. Muskmelons produce their fruit, at the axils of the first leaf of the lateral branches. These branches, if the leading branches are allowed to grow, do not shoot out, until the leaders have made growths of considerable length. The leaders are the centre shoots, and one or two of the first branches above the seed leaves; these it will be found upon examination, do not show fruit at the first leaf. All these leaders should be pinched off at the points, as soon as they have produced about three leaves, which will cause the lateral or bearing branches, to put forth at least one week sooner than they otherwise would. When the bearing branches have put out two leaves beyond the fruit, they should also be nipped off. When the fruit is in flower, they should be examined, as by this method, there will sometimes be a scarcity of male blossoms, and the fruit will drop for want of pollen.

As it is an object to insure the first setting of the fruit, both on account of ripening early, and its being near the roots of the vine, it is well to go over them, and dust the fruit blossoms artificially. In doing this, always prefer a male blossom from the same vine, if you wish to keep your varieties distinct. Having selected a male flower that is in perfection, touch the anther carefully to the stigma of the female flower, which is on the end of the fruit, by which means the stigma will be covered with the pollen from the male plant; or it may be applied by jarring the male flower directly over the female flower, by which a quantity of the pollen will be detached and fall upon the stigma, by which the fecundation will be accomplished. Although these little manoeuvres may seem tedious to those who have not made the experiment, they are easier performed than described and are well worth the attention of every lover of good melons. A vine should not be allowed to ripen more than two or three melons, as by increasing the number, the size and flavor of the fruit is materially injured. Watermelons, and cucumbers, are not so regular in the setting of their fruit, and of course trimming is not so important, but it is well in gardens where the vines are exposed to the winds, to give a proper direction to leading cucumber vines, and fasten them by sticking small hooks over the branches, to confine them to their places, and when the branches become too thick, they should be cut off as for fruit trees.—*Genesee Farmer.*

From the New York Farmer.

SHALLOW SOWING—DEFECT IN HARROWS.

In nature there is scarcely any other provision made for sowing seed, than by scattering them on the surface of the ground principally by the aid of winds. One leading fact may be inferred from this circumstance—that although many seeds sown do not germinate, yet the depth to which these become covered that do grow, must be very inconsiderable. This fact is in accordance with the observation and experiments of agriculturists. They have found that plants which are planted deep come up more slowly and sickly, and produce less abundantly than those that are planted at a proper depth. For most kinds of seeds one inch is a sufficient depth: and in moist favorable weather half an inch. But the greater part of grain sown in this country varies from the smallest part of an inch to three or four inches in the same field. The consequence must be a very great difference in the time of coming up, and in the vigor of the plant. On this subject, F. Von Veght, a German writer, thus speaks.

‘I remarked also, that not only in the peasants’ fields, but also in mine, the corn always sprang up unequally, and this not only as regarded the length or shortness of the time in which it became visible, but also with respect to the strength and fullness of the plant. Hillebert had ascribed this to inequality in the germinating power of the seeds, since seeds sown close together, and under precisely the same circumstances, had brought forth very weak and powerful plants. I thought also that some disease had hindered the corn in its unfolding, or that it might have suffered from worms. Turning my attention to the point, in consequence of what Burger said about it, I took up out of many fields plants of the rye and barley, which showed this difference, and found, al-

most without exception, that all the strongly growing plants were covered with very little earth, and that the seeds of all the weak plants were from one and a half to three inches from the surface. Each had shot out many little roots, and at the same time with the opening of the seed-leaves the coronal knot had formed itself immediately above the soil; roots and small shoots richly and strongly, and quite contemporaneously, and in nearly like proportion, sprouted out; even on the same side where a crown (main?) root penetrated into the earth arose a new shoot. The broad fresh leaves promised to afford much nourishment to the plants from the atmosphere, and there-by to occasion a vigorous growth. How was it with regard to the more deeply sown seed? The little roots were few in number, and weakly; from the seed a small whitish pipe, from one to two inches in length, had sprung to the surface: the coronal knot formed itself on the surface, but with only a few meagre leaves, and one solitary ear alone expanded thereon.’

From the above, it can be readily seen, that harrows in common use do not cover the seed to a uniform depth, but on the contrary vary it from the slightest possible covering to that of three or four inches. If the health, vigor, and productiveness of the plant depend so much on the proper depth, we should suppose it of primary consequence that no expense be spared in constructing suitable harrows, and bringing the soil to a proper degree of pulverization and evenness.

From the Genesee Farmer.

TOADS.

There are few parts of the animal creation that are looked upon with more contempt than toads; and yet they are capable of ministering to the comfort and convenience of man. One reason why we look upon them with so much contempt is, that we form our opinions of them, as we are too apt to do with our own species, altogether by outward appearances, without inquiring into their good or bad qualities. We confess that there is nothing very inviting in the outward appearance of one of these animals; but when we make ourselves more acquainted with their habits, our dislike of them ceases, for in this it is as in politics—we land that man who is working for us, whom we would treat with contempt in another situation. Toads, during the summer months feed almost entirely upon insects, and in the ordinary course of their feeding the number destroyed is quite considerable. Mr Bradley, in his Treatise on Husbandry and Gardening, states that, a pair of sparrows, during the time they have their young, destroy 3,360 caterpillars each week, or 240 for each bird daily. Now if we make comparison between the size of a toad and a sparrow, and allow that a given weight of either requires a given quantity of food for a certain period, we must suppose that the number of insects devoured by toads is very great. We have frequently seen it recommended to put toads in gardens to preserve young cucumber plants from the striped bug. They are not effectual for that purpose, as the bug does most damage during the heat of the day; at which time the toad either burrows himself in the ground, or seeks some other retreat from the rays of the sun.

They are, however, very useful at the same time for other purposes. The brown worms which destroy the cabbage plants, do their mischief in the night, at which time the toads are on

the alert; and if a sufficient number of them are put in a garden, they will protect the cabbage.—But it is during the months of July and August that these animals will be found of the greatest use to the gardener. Although the melon, cucumber and squash vines during these months, are of that size that the yellow bugs cannot entirely destroy them, yet they continue to feed and multiply upon them in a compound ratio, and in this neighborhood the large black brown bugs, often become so numerous upon squashes as entirely to check the growth of the vine. Where gardens are fenced with boards and tight, a few toads put in will entirely destroy those bugs, which if left would be sure to appear in an abundance the following spring.

It has been recommended to place small pieces of boards about one inch from the ground supported upon small stones, in that quarter of the garden where the labors of these animals are wanted, as they will take shelter from the sun, under them; but after cabbage leaves have attained their size, they afford them sufficient covering.

It is of as much importance and benefit to the succeeding crop that insects should be destroyed as weeds, for although insects are furnished with wings, there is reason to believe that they deposit their eggs near the place where they feed, as we frequently observe that fields which have been a few years in grass, when ploughed and planted with vines, that they are not eaten with bugs although contiguous to gardens or old fields where they are very injurious.

From the American Farmer.

NEW COMPOST FOR FLOWER POTS.

I have from my childhood been passionately fond of horticultural pursuit,—have devoted much time to ornamental gardening; and in my travels I have gleaned all the information in my power on the subject of fertilizing the soil. In the summer of 1821 I was in Albany, and visited Judge Buel's plantation, which was in the highest state of cultivation, and which as every one knows, is indebted to art alone for its fertility,—having been cut and made from an entire swamp. I walked the whole ground over with the judge and his lady and treasured up many curious facts relative to gardening, which I have since practised upon in a small away, with great success. Since that time I have also visited the most celebrated gardens in and near Boston, Hartford, New York, and Philadelphia; but in those places they have the advantage of naturally good soil, and do not require so much artificial aid to produce large, growth of either esculent or ornamental plants which is necessary, in order to procure the same growth from the less fertile soil, in and around Baltimore.

Last winter, soon after my arrival in Baltimore, a friend presented me with an Oleander, which had spun up to an unwieldy height, but the leaves were very dwarfish; and yet small as they were, the stalk was so slender, as scarcely to be able to support the scraggy top. It looked so little like the broad leafed Oleanders I had seen at the north, that I almost doubted its being the same species of plant. About this time I saw in Messrs Calvert and Ducatel's paper directions for obtaining large growth of cabbages, and I resolved to try the experiment on my dwarf-leaved Oleander. Accordingly, as soon as the spring opened, I procured some common red earth,

which was of a very tenacious clayey consistence—spread it upon a wide board—overlaid it with a strata of lime, which I slaked—not with seawater according to the directions, because I could not procure it—but with rain water into which I had previously put sufficient common salt to make it about like seawater to the taste. I then laid another strata of earth, and then again of lime, making two of each, and the whole made moist with salt water. I then added four quarts of river sand as an improvement of my own; for, although the receipt did not name it, I took the liberty to judge that so much clay as the earth contained would adhere again in a mass without the aid of sand or something to separate its particles. The whole measured about two thirds of a bushel, one third of which was lime and sand. A servant stirred it regularly for me every day until the ingredients were well incorporated, and in three or four weeks it had entirely lost its reddish color and had become quite black. About the middle of April I cut off the top of the Oleander, down within two feet of the roots and trimmed off all the ground shoots and some of the branches. I did not transplant it, as it grew in a large tub, but removed all the earth from the top and sides of the roots—at least half a bushel of it, and filled up the tub with the new preparation. It was then placed in the yard in a southern exposure where it has ever since remained subject to the sun and rain, and copious waterings, from the pump as often as the earth became dry,—and such a rapid and luxuriant growth I never witnessed. My friends told me at first that I had killed my Oleander—and I confess I had some misgivings as to the success of the experiment; but in less than two weeks after the application of the new earth, new leaves began to put forth surprisingly, and their enormous size and bright green lustre have been the subject of much comment among its numerous admirers. It is now in blossom, and on measuring the new growth which is easily ascertained by the increased size and brilliancy of the leaves, I find it to be, now the first week in July, just 16 inches. The main stalk and limbs have also increased in the same ratio.

LOTTERIES.

We wish our readers first to understand, that lotteries can never add one cent to the wealth of the country. They do not even profess to do it. They only transfer money from one man to another. If all who are engaged in the traffic were to quit it and go to raising potatoes, the amount of valuable property in the country would be increased. Lotteries deprive the country of all that they would otherwise earn.

Consider next, the influence of lottery gambling on a man's habits. His object is, to get rich suddenly and easily—more suddenly and more easily than he can by industry and economy. Keeping a man's mind agitated with hopes of becoming suddenly rich without labor, must make him more and more dissatisfied with the sure and steady gains which are the reward of industry—must render his ordinary business insipid and tiresome, and lead him so to neglect it, as to become a bankrupt. This is the history of most of those who are induced to speculate in lotteries.

Consider, again, what sort of men lottery dealers expect to prevail with. You may learn this by considering the arguments they use. If it were

in our power we would here insert some of the cuts, with which lottery advertisements are decorated. You may see them, however, in other papers. Look at them. Look at the whole parade of dancing goddesses, and misshapen, grinning dwarfs, with money bags as big as themselves. What powerful arguments these! How well adapted to persuade reasonable men! The ticket seller hopes that you are silly enough to be induced to buy a ticket, by looking at the supremely silly giggle on that face in the newspaper. If you are not silly enough for that, he has no hopes of you. He does not attempt, for he does not think it possible, to gain custom from any but the silliest part of the community. In this, he doubtless judges correctly.

Look at the published schemes of lotteries. You will find—so many prizes, amounting to so much—a very splendid parade of temptation; but will not find how many blanks. The dealers know, that if they should tell you that, you would not buy their ticket.

Do not suppose that all the money which is paid in for tickets is paid out again in prizes. No such thing. Fifteen per cent on the prizes goes at once to bear the expenses of the lottery, i. e. into the pockets of the managers,—where it stays, till a little of it is screwed out of them for some public object, by a legal examination, which they know very well how to evade. And then the price of tickets is just what the dealers can get. A writer in the Vermont Watchman shows, that on the sixteenth class of the N. Y. consolidated lottery, there is left to the managers and dealers, the nice little sum of \$181,641 60. One such lottery in six weeks would amount to \$787,113 60 in six months, and \$4,722,681 60 in three years. Besides all this, Mr Canfield, formerly a manager and extensive lottery dealer, has shown that the business may be so managed, that the tickets which remain unsold in the hands of the managers and dealers shall have the best chance to draw high prizes; and observing men have noticed, that high prizes are seldom drawn by any but those who are concerned in managing and selling.

Besides, if you should draw a prize, how do you know that you shall ever get your money? One dealer somewhere on the Hudson, a few years since, sold nineteen quarters of one ticket. It drew a prize, and he ran away. If it had been a blank, the fraud never would have been known. How do you know, when you buy a ticket, that the same number is not sold to twenty others, and that, if it draws a prize, some of them will not receive it instead of you? Indeed, how do you know that the fact will not be concealed from the public altogether?—Verily if there is such a thing as legalized swindling in the world, this lottery business is the thing. And we are astonished to see how many printers, for the paltry consideration of five or ten dollars, will help lottery dealers to swindle the public, by inserting their advertisements. How such printers must love the dear people!—*Windsor Vt. Chronicle.*

To destroy Mosquitoes.—Take a few hot coals in a shovel or chaffing dish, and burn some brown sugar in your bedrooms and parlors, and you effectually destroy the mosquito for the night. The experiment has been tried by several of our citizens, and found to produce the desired effect.—*New York Evening Post.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, AUG. 3, 1831.

WORCESTER CATTLE SHOW.

By the kindness of William D. Wheeler, Esq. Secretary of the Worcester County Agricultural Society, we have received a large and elegant handbill, containing a prospective notice of the Cattle Show, Exhibition of Manufactures, and Ploughing Match, which the Trustees of the Society propose at Worcester, on the 20th day of October next, at 9 o'clock A. M. Mr Wheeler states that every exertion is making to have a better Show this year at Worcester, than has ever been exhibited at that place. Our Premiums are increased in number and amount on Stock and the products of the Dairy. The Trustees have invited an experienced Agriculturist, (Hon. Oliver Fiske,) who has accepted the invitation to address the Society on that occasion; and as the Yeomanry of Massachusetts are proud of their stock, and have stock to be proud of, I think we may safely invite our Agricultural friends in all parts of the State to attend our Show on the 20th of October next, without fear of their disappointment.

We are happy to perceive that our Worcester friends are determined this year, to outdo what they have always so well done; and have no doubt their exhibition will be a perfect mirror of the enterprise, industry, intelligence and skill of the *Head of Agriculture*, as well as the *Heart of the Commonwealth*.

DALE'S NEW HYBRID TURNIP.

The following Account of this new Turnip, by Mr Charles Lawson, is from the Edinburgh Quarterly Journal of Agriculture, No. 10, for 1831.

There are many varieties of the turnip in cultivation, which are more or less held in esteem, according to their supposed qualities, the nature of the soil in which they are to be grown, and other circumstances; but those in most general use are, the White Globe, the Red-Top Yellow Bullock, the Green-Top Yellow Bullock, and the Swedish or Ruta Baga. The White Globe grows to the largest size, arrives soonest at maturity, and decays earliest in the season; the Yellows are intermediate between the Globe and the Swedish in their properties; and the Swedish is smallest in size, is latest in arriving at maturity, and often does not decay, till, in the advanced state of the

following spring, the plant loses its nutritive properties by pushing out a flower-stem: hence the Swedish is well adapted and chiefly employed for spring feeding. The Swedish Turnip possesses the greatest nutritive powers, and the largest of this variety yields more nourishment in proportion than the middle-sized ones; while the Globe, which attains the greatest bulk, contains the least nutritive matter, and the larger kinds less proportionally than the middling-sized ones of the same variety.

New varieties or hybrids of turnips are obtained by cross-impregnation. Thus, when two varieties are planted alternately or promiscuously in a plot of ground, when they come into flower, the pollen is wafted by the wind indiscriminately over the whole, or carried from one plant to another by insects, when they are in quest of the sweets of the nectary, and applied to the stigmata. But though the means of producing new varieties are simple and easily accomplished, little improvement in this respect has been made in the varieties now generally used in field culture.

In all cases of turnip seeds going through my hands in the course of a season, I keep specimens, which are sown at the proper period in drills in my nursery. This is done for the purpose of examining the progress of the plants and the development of their roots during the season; it also enables me to ascertain the correctness of the different stocks of seeds, and to judge of the superiority of one variety over another. Two years ago, my attention, was particularly attracted to the produce of the sample of a hybrid or doubly-impregnated sort, the seed of which I received from Mr Robert Dale, a very intelligent farmer at Libberton West Mains, near Edinburgh. It attracted my attention, first, on account of its early growth and maturation; secondly, its fine shape, as may be seen in the figure; thirdly, by the great size to which it attained, in comparison with any sort under similar treatment; and, lastly, by its standing the winter equally well with any other turnip except the Swedish.

And conceiving that the great desideratum in the selection of a proper variety of the turnip, is to obtain the greatest possible weight on a given space and at a given expense of manure, this variety seems to be more adapted to this end than any other sort hitherto introduced.

The manner in which it was obtained by Mr Dale, was the following: In the year 1822 or 1823, he got a few ounces of seed of a new hybrid turnip from James Shireff, Esq. of Bastleridge in Berwickshire. This, Mr Dale sowed, and he found the produce to resemble the Swedish in shape, but it had too few of the superior properties of that variety. He, therefore, picked out such as had most of the yellow appearance, and planted them along with some of the best Swedish which he could find. This he continued doing for four successive years; and, since that period, he has selected the best roots of the doubly impregnated kind which he could find for raising seed, till they have attained the quality which they now possess.

The following comparison will show in what respect this hybrid is superior to or differs from the turnips at present in cultivation:—

White Globe,	} of these, is equal in size to any of these, is closer in the texture, and is as early.
White Tankard,	
Pomeranian Globe,	
Hungarian Globe,	

TO SUCCEED THE ABOVE,

Red Norfolk,
Green Norfolk,
White Norfolk,
Green Globe,
Red Tankard,
Yellow Globe,
Bullock's Head,

The hybrid is superior in size, its texture, and in shape, to all of these.

TO FOLLOW THESE,

Purple-top Yellow
Bullock,
Green-top, ditto,
Tankard Yellow,

The hybrid is superior in size, and, in so far as it has been tried, it stands the winter as well.

FOR LATE USE,

Purple-top Swedish,
Green-top Swedish,
Spring,

The hybrid is superior in size, but shoots to flower earlier in spring, and is not so hardy.

This hybrid, or doubly-impregnated turnip, therefore, appears to possess properties in general superior to those varieties which have been enumerated above. It is equal to, or surpasses the yellow and the other sorts above it, and is only excelled by the Swedish, in the latter being more hardy, and later in spring in running to a flower-stem. It is now generally known by the name of Dale's Turnip or Dale's Hybrid.

The facts which I have stated will, I trust, be considered in this respect interesting, that they show an easy method by which intelligent agriculturists may increase or improve the varieties of the plants which they cultivate.

CHARLES LAWSON.

A very few small packages of the genuine seed of this new variety of turnip have been received at Mr Russell's Seed Store, Boston;—it was obtained by the Messrs Thorburn, directly from Adam Ferguson, Esq. of Woodhill, Scotland.

Horticultural Hall, }
July 20, 1831. }

FRUITS EXHIBITED.

Pears—A beautiful specimen of the Petit Blaque, and also of the Satnal, were presented by Mr Robert Manning, of Salem.

Apricots—A handsome specimen for the season, of a variety supposed to be the White Apricot, was presented by the Hon. John Welles, with some buds of the same for distribution.

Apples—Some Early Bough, of 'Coxe,' were presented by Mr Manning.

These were presented the 23d, and omitted, a specimen of the Sugar-top Peas, from Mr Reed— and some handsome Moor-Park Apricots, from Mr E. Dyer. Also, fine Citron de Carnes Pears, from Mr R. Manning. S. DOWNER, Chairman.

The Society was presented with a variety of seeds of ornamental plants, by Mr S. C. Parkhurst, of Cincinnati, Ohio, collected by Mr T. Adamson for the Society, in the Western States.

Leaves of the Sweet Scented Grape for Arbors; and also of the Native Mulberry of the Western States, were also presented by Mr Parkhurst.

New Treatise on Silk.—Carter, Hendee and Babcock have in press a new treatise on the culture of the White Mulberry tree and the raising of silk worms, by Jonathan H. Cobb, Esq.—prepared under the direction of His Excellency Gov. Lincoln, agreeably to a resolve of the Massachusetts Legislature passed last February—the treatise to be distributed through the several towns of the Commonwealth.

In Newark, Pa. as a man was riding home on a load of grain, without binding, a part of the sheaves slid off, throwing him to the ground. Before he could recover himself, one of the wheels passed over his head, mangling it in a shocking manner, and terminating life in a few minutes.

Black Currant Wine.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A further supply of superior old Black Currant Wine, made under the inspection of John Prince, Esq. Roxbury; an account of its astringent and detergent properties in various complaints, will be found in the N. E. Farmer, vol. 5, p. 267, written by S. W. Pomeroy, Esq. and the late Doct. J. G. Coffin. It is highly salutary in many summer complaints. Doct. Coffin states: "It has been attended with remarkable success in the early stages of cholera morbus and dysentery—and again also in the later stages of these diseases, after the symptoms of inflammation or febrile excitement had ceased. It has been strikingly remedial in the low states of typhoid and bilious fever." The late Capt. Gilchrist, who for several years followed the Batavia trade, and who had almost suffered an attack of the severe cholera which proves so destructive of human life in that climate, used to say that after he had this wine with him, and took two glasses of it every morning, he escaped the disease. On one voyage, his mate, who had not taken the wine, was seized with this complaint, when a bottle or two stopped its progress. We have not room to enumerate any other morbid affections in which this wine has proved useful. In sore throat it has, for many years, been considered almost a specific remedy.—Price 75 cts. per bottle. Aug. 3.

European Lecches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical *Lecch*. All orders will receive prompt attention. EBENEZER WIGHT,
46, Milk street, opposite Federal-st., Apothecary.
August 3. *copif*

Tulip Roots.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A splendid collection of Tulip Roots, now in fine order for transplanting, comprising some of the most beautiful varieties now cultivated in this vicinity, viz:
Marbled or mottled, dark stemans.
White and Purple, ditto.
Yellow and Purple, ditto.
Double Yellow Rose.
Double pale yellow flamed, (Passe non plus ultra.)
Crimson, yellow centre and yellow stemans.
White, shaded with red, dark centre and stemans.
Fine large yellow, with yellow stemans.
Double white, with red shades, (beautiful.)
Double orange brown, (very large.)
Double prissy rose.
Double roice color.
Parrot tulips, of several colors.
Fine bibloems, (striped on white ground.)
Fine bizzars, (striped on yellow ground.)
Fine Rosy, on white, &c. &c. Price 12½ cts. each—\$1 per doz.

The above are of large size, and are raised from superior imported roots, some of which cost \$1 each.

Also, common tulip roots, of all colors, and of good size, price \$3 per hundred, suitable for those commencing a large tulip bed.

Also, Double White and Yellow sweet scented Narcissus—12½ cts. each—\$1 per doz.

Mixed Crocus roots—50 cts. per dozen. Aug. 3.

Seeds for Fall Sowing.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

Garden and Field Seeds, suitable for fall sowing, among which are—

WHITE PORTUGAL ONION.
PRICKLY SPINACH, (for early greens).
BLACK SPANISH or WINTER RADISH.
LONG DUTCH PARSNIP, and a variety of other garden seeds.

Also—TIMOTHY or HERB GRASS—ORCHARD GRASS—RED TOP, RED and WHITE CLOVER, &c. &c. Aug. 3.

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed. Aug. 3.

Zinc Milk Pans.

For sale at the Agricultural Warehouse—Westfield's patent Zinc Milk Pans. A particular account of this great improvement in dairying will be found in the New England Farmer for July 6, 1831, page 405, and many other journals. Milk in these pans will keep sweet longer than in those of other materials, and thus consequently afford a longer time for the cream to rise, and produce one sixth more butter, as has been proved, of the sweetest quality. The pans are very durable, and not likely to rust.

NOTICE.

The undersigned being owner of the Letters patent for the manufacture of the above article, hereby cautions the Public from trespassing on his patent right, as they would avoid the penalty of the law; and also gives notice that he has appointed J. R. Newell, proprietor of the Agricultural Warehouse in the city of Boston, his Agent for vending the above articles.

Aug. 3.

CHARLES BISHOP.

Dale's Hybrid Turnip Seed.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A few packages of seed of this new variety of turnip, so highly esteemed in Scotland, and which is described in this week's N. E. Farmer.—Price 12½ cts. each paper. Aug. 3.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer's office. Aug. 3.

Medical School in Boston.

The Medical Lectures of Harvard University delivered in Boston will be commenced in the Autumn, at the usual period, viz. on the third Wednesday in October. They will be continued four months.

This extension in the term of the Lectures has been thought necessary to afford time for such a course of instruction and demonstration, as is deemed by the Faculty to be requisite, under the advantages which have recently accrued to the School.

The Legislature of Massachusetts, with an enlightened liberality, which does honor to our age and country, have extended the protection of law to the cultivation of Anatomy within this Commonwealth. The advantages which will hence result to students resorting to this school will be sufficiently obvious. It will be the aim of the Professors to carry into effect the intentions of the Legislature, in such a manner as to evince at the same time their respect for the rights of humanity, and their interest in the promotion of the healing art.

The opportunities for practical instruction at the Massachusetts General Hospital continue undiminished.

The course of Lectures will be—

On Anatomy and Surgery, by Dr Warren.

" Chemistry, by Dr Webster.

" Materia Medica, by Dr Bigelow.

" Obstetrics and Medical Jurisprudence, by Dr Channing.

" Theory and Practice of Physic and on Clinical Medicine, by Dr Jackson.

WALTER CHANNING,

Dean of the Faculty of Medicine.

Boston, June 15, 1831.

6*

Lynn Mineral Spring Hotel.

Ten miles from Boston, Six from Salem, and Five from Nahant.

The subscriber most respectfully begs leave to inform his friends and the public that he continues to keep that delightful Summer retreat, the Lynn Mineral Spring Hotel, which it will be his object to render a genteel and pleasant resort for Boarders, Parties of Pleasure, transient Visitors, &c.

The salubrious qualities of the waters of this celebrated Spring—the beautiful lake, on the borders of which the establishment is situated, abounding with fish of various descriptions, and surrounded with the most wild and romantic scenery—splendid Boats for sailing or fishing—Bathing rooms on the margin of the lake, where the warm or cold bath may at any time be taken—the delightful situation of the House, with its comfortable and well furnished apartments, with the fruit and flower Gardens adjoining, are attractions for those in pursuit of health or pleasure, rarely excelled if equalled in any part of the country.

Every exertion shall be made to merit a continuance of that patronage which has been so liberally bestowed. July 20.

JAMES W. BARTON.

30 Dollars Reward.

The above reward will be paid by the Subscriber for the detection and conviction of the vile wretch or wretches who have been base enough to break down a large number of young rock maple Trees, set out on the road adjoining his Farm, leading from Dedham turnpike to Brushhill turnpike, for the purpose of shade and ornament. As the vile wretch who could be guilty of such a crime is dangerous to the community, it is hoped that the citizens of Roxbury and Dorchester will be vigilant in endeavoring to detect him, in order that he may be brought to public justice. JEREMIAH HILL.
Boston, July, 1831. July 20.

Bees.

The Subscriber has 300 swarms of Bees for sale, in his Patent Slide Beehives, at 20 cents per pound, weight of each swarm from 40 to 100 lbs. tare of hive deducted; the price of the Patent hives is \$2 a piece, and the price of a single gift \$5.

Also for sale, 200 swarms of bees in the old fashioned live, price 17 cents per pound, tare of hive deducted.

The above will be delivered within fifty miles of Boston, in good order, (warranted free from moths or otherwise damaged) by the first day of March, 1832.

All letters must be sent in before the first day of September, 1831, post paid, to the subscriber, at Brighton, Mass. so as to have time to transport them from Maine.

N. B. The weight of the above hives will be taken in September. EBENEZER BEARD.
July 6. *ep2m*

Cocoons Wanted.

The Subscriber will pay cash for Cocoons, from 25 to 50 cents, according to quality. J. H. COBB.
Dedham, July 15th, 1831. St July 20.

Wanted,

A young woman from the country, from 18 to 30 years of age, who is neat and faithful, may hear of an excellent situation to do the ordinary work in a small family, (who reside in the country during the summer,) where she will receive good treatment and the highest wages. Also wanted in the same family, a young girl from 14 to 16 years of age, to take care of children. Apply at the Farmer's office, 50½ North Market street. July 20.

Ammunition.

Of the best quality and lowest prices, for sporting—constantly on sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. 11 Jan.

BRIGHTON MARKET—Monday, Aug. 1.

[Reported for the Chronicle and Patriot.]

At Market this day 407 Beef Cattle; 25 Store, 18 Cows and Calves, 3094 Sheep, and 260 Swine. 10 Beef Cattle remained unsold at the close of the market.

PRICES.—Beef Cattle—Last week's prices were not supported; we shall quote from \$4 00 to 5 25.

Cows and Calves.—Sales were effected at \$16, 18, 21, 23, 27, 28 and 30.

Sheep and Lambs—A large proportion of those at market were of an ordinary quality. We noticed lots taken at \$1 62½, 1 67, 1 75, 1 88, 2 00, 2 12, 2 25, and 2 50; one lot of wethers at \$3 00, and one at 3 50.

Swine—A few only were taken in lots; small pigs weighing from 20 to 60 lbs. were retailed at 5c. for sows and 6c. for barrows.

New York Cattle Market, July 25.—At market 800 a 900 Beef Cattle, 3000 Sheep and Lambs, 18 Miled Cows, and 50 Swine. About 200 Beef Cattle, and a considerable number of Sheep were left unsold.

Prices.—Beef, extra, \$6 50, good 5 75 a 6 00 and 6 25, fair 5 00 a 5 25, and ordinary 4 50 a 4 75 per ewt. Sheep, extra, 5, good 3 00 a 3 50, fair 2 25 a 2 50, ordinary 1 50 a 1 75, each. Lambs 1 25 a 2 75. Miled Cows very dull, extra \$25 a 30, ordinary 18 a 20 each. The Swine were all sold from 4 a 4½c.

¶ In the New York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

From the Hartford Review.

THE STRANGER.

I saw him, Lucy, only once—as down the lighted hall
We moved to music playfully—a stranger to us all—
A stranger with a pale white brow, and dark and mean-
ing eye.

Which flashed like lightning on my own when'er he
passed me by.

That soul like eye! it haunts me still!—so passionately
deep,
Like those which sometimes beam on us in visions of our
sleep—

So sad as if some shadowing grief had o'er his spirit
gone,
Yet brightening strangely as it caught the answer of my
own!

I knew him not—yet even when I turned me from the
dance

I saw his dark eye follow me—it could not be by
chance—

I knew him not—and yet his tones were breathed upon
my ear
So sweetly low and musical, I could not choose but hear.

He spoke of sunny Italy—of Venice and her isles—
Of dark mustachioed cavaliers and fair Signora's smiles—
Of music melting on the sea—of moonlight upon bowers,
Of fair hands wreathing silken curls with gay and pleas-
ant flowers!

And when he spoke of lovely ones—or praised a soul
like eye,

His deep full glance was fixed on mine, as if it sought
reply.

The flush was deepened on my cheek—my voice grew
faint and low,

I trembled at his earnest gaze—'twas foolishness, I know.

We parted at my father's door—the moonlight sweetly
shone—

And I was standing at his side—my arm was on his own;
He sighed, dear Lucy, *how* he sighed! my eyes grew
strangely dim,

It pained my heart to hear his sigh—I could have wept
for him!

He spoke of disappointed hope—of dreams that faded
soon—

The dew drops of life's joyous morn, which vanish ere
its noon—

He spoke of loneliness of heart—of weariness and pain—
And murmured that a life like his was desolate and vain.

He said his father's castle frowned upon a foreign
shore—

(A castle, Lucy, think of that—he is a Count or more!)—
That solitude was in its halls—chill, prison-like and lone,
Ungladdened by the smile of love or woman's kindly tone.

And then dear Lucy, blame me not, we wept with one
another,

You would yourself have pitied him and loved him as a
brother,

So handsome and so sorrowful—so haughty yet so kind,
O dear—I cannot keep his look one moment from my
mind.

He pressed my hand at parting, and tonight he will be
here,

While Pa is at his game of chess, and Ma is nowhere,
near;

Excuse me, dearest Lucy, now—indeed I cannot write,
Tomorrow I will tell you more—he will be here to-
night.

P. S.—Oh, dearest Lucy, pity me—I really think I'm
dying—

My heart is like a heart of lead—my eyes are red with
crying—

But yesterday the Bank was robbed, and of a large
amount,

My father tried the robber, and oh God!—it was my
Count.

Love.—Love is not merely a mental affection, but a
bodily malady, like a fever. If subjected to metho-
dical treatment, such as strong sudorifics and copi-

ous bleeding, it may often be cured. The Prince of
Conde at the height of his attachment to a lady of
great merit, was obliged to join the army; but re-
membrance and constant correspondence kept the
sentiment alive. A dangerous malady reduced him
to the last extremity; the remedies which effected
his cure, carried off also his love, and he arose a
sane man.

The Olden Time.—The following fourth of July
oration was delivered by Mr Timothy Dexter, in N.
Hampshire in 1793:

Ladies and Gentlemen:

This day, the eighteenth year of our glorious in-
dependence commences. Justice, order, commerce,
agriculture, the sciences, and tranquillity reign tri-
umphant, in these United and happy States:—America
is an asylum for the afflicted, persecuted, and
tormented sons and daughters of Europe—our pro-
gress towards the glorious object of our revolution,
is unparalleled in the annals of mankind.

Permit me then, my friends and fellow citizens, to
congratulate you on this joyful occasion. Let our
department be suitable to the joyful purpose for
which we are assembled. Let good nature, good
breeding, concord, benevolence, piety and gratitude,
understanding, wit and vivacity—grace, bless, adorn,
and crown us henceforth and forever.

The worst of all.—A zealous, and in his way a ve-
ry eminent preacher, happened to miss a constant
auditor from his congregation. Schism had already
made some depredations on the fold, which was not
so large, but to a practised eye the reduction of even
one was perceptible. 'What keeps our friend, far-
mer B. away from us?' was the anxious question
proposed by our vigilant minister to his clerks; 'I
have not seen him among us these three weeks; I
hope it is not *Socinianism* that keeps him away.'—
'No, your honor,' replied the clerk, 'it is something
worse than Socinianism.' 'God forbid it should be
Deism.' 'No, your honor, it is something worse
than that.' 'Worse than Deism! Good heavens! I
trust it is not *Atheism*.' 'No, your honor, it is some-
thing worse than that.' 'Worse than Atheism! im-
possible: nothing can be worse than Atheism.' 'Yes
it is, your honor—it is *Rheumatism*.'

QUACKERY. The Scrutatory Case.—A lady on
Long Island, N. Y. considerably advanced in age,
having been for some time afflicted with an affection
of the nerves, and the neighboring physicians having
failed to effectually repair her broken constitution,
hearing of one of the quack orders, she had him cal-
led. After he had for some time examined her pulse
she inquired, 'Doctor, do you understand my com-
plaint?' He answered, 'Ma'am, it is a scrutatory
case.' 'Pray, Doctor,' inquired the lady, 'what is
that?' 'It is a dropping of the nerves, ma'am,
the nerves having fallen into the pizarium, and the
head goes tizarizen.' 'Ah! Doctor,' exclaimed the
lady, you have described my feelings
exactly.'

Incident at the Siege of Ancona.—A woman of An-
cona, heart-broken by the exhaustion of her two sons
and hopeless of other relief, opened a vein in her
left arm; and having prepared and disguised the
blood which flowed from it with spices and con-
fiments (for these luxuries still abounded, as if to mock
the cravings of that hunger, which had slight need
of any further stimulant than its own necessity) pre-
sented them with the beverage—thus prolonging the
existence of her children, like the bird of which simi-
lar tenderness is fabled, even at the price of that
tide of life by which her own was sustained.

Sketches of Venetian History.

A Frenchman, wishing to take stage for Buffalo,
was asked by the driver if he had any extra bag-
gage. 'Extra baggage! what you call dat? I have
no baggage but my tree trunks, five dogs, and von
black girl.'

The Baltimore and Susquehanna Rail Road still con-
tinues to be thronged with passengers.—The seats in
the cars are frequently taken more than an hour before
the time of starting.

WHAT IS ARISTOCRACY?—In reply to the ques-
tion of an ultra, what is aristocracy? Gen. Foy,
a distinguished orator in the French Chambers,
gave the following definition:—I can tell you
what it is,' said he, 'aristocracy of the 19th cen-
tury, is the coalition, the league of those who
would consume without working; know everything
without learning anything; carry away all the
honors without deserving them; and occupy all the
places of government without being capable of fill-
ing them.'

Sailor's Veracity.—A son of Neptune said the
other day to a brother tar, Jack, you never caught
me in a lie in your life. 'Very true,' replied Jack,
but, blast you, I have chased you from one lie to
another all day.

Why is the life of an Editor like the Book of
Revelations? Because it is full of 'types and
shadows,' and a mighty voice, like the sound of
many waters, ever saying unto him—*Write!*

Consolation.—An old lady once being very
sorely afflicted with a disorder usually denomi-
nated hysterics, imagined she could not breathe,
and appealed to her husband on the occasion,
with 'Mr—, I can't breathe.' 'Well, my dear,'
returned the affectionate husband, 'I would not
try, for nobody wants you should.'

A GOURMAND at an ordinary had eaten so
enormously, that the company were astonished
and disgusted with his gluttony. The gentleman
at the head of the table ironically pressed him
to take another plateful, observing he had actu-
ally eaten nothing. The gourmand declined taking
any more, observing that his stomach was quite
gone. Upon which an Irish gentleman opposite
exclaimed, 'Is it your stomach that's gone, my
honey? you mean the bottom part of it.'

Indian Eloquence.—The following is extracted from
a late speech before the Governor and Assembly of Penn-
sylvania, by the Chief of the Menomones. It has all
the figurative energy of Indian Eloquence:

'Brother—We see your Council House. It is large
and beautiful. But the Council House of the Red Man
is much larger. The earth is the floor—the clear sky is
the roof—a blazing fire is the chair of the Chief Orator,
and the green grass the seats of our Chiefs. You speak
by papers, and record your words in books; but we speak
from our heart, and memory records our words in the
hearts of our people.'

Published every Wednesday Evening, at \$3 per annum
payable at the end of the year—but those who pay within
sixty days from the time of subscribing, are entitled to a de-
duction of fifty cents.

[No paper will be sent to a distance without payment
being made in advance.]

MANAGEMENT OF FRUIT TREES.

MR FESSENDEN—Seeing in a late number of your valuable paper, an extract from the *Genesee Farmer*, on the efficacy of the application of soap in preventing the ravages of caterpillars and other insects on fruit trees, I am induced to mention the method which for four years past, I have pursued, with regard to my peach, and other fruit trees on my farm.

The peach trees, I have annually topped down, say two thirds of the previous year's growth, and have found that this operation, invariably, had given increased strength to the stock, vigor to the lateral and bearing branches, and protects the trees, in a great measure, from the violence of the wind. At every time of trimming, I have given them a wash of soap diluted to the consistency of common paint (and this has been repeated twice during the summer months) throughout the trunk and branches, the branches from the manner of pruning, being within reach of a short brush.

There has been in my neighborhood, this season, great complaints of a blight on the peach trees, with a shedding of the fruit. On all of mine (thus treated) no blight has appeared, and on those of them which blossomed, there is now a fair quantity of fruit. I can account for this difference in no other way, than by the manner of pruning and frequent application of the soap wash.

The tender shoots of some of my old, headed down peach trees, were soon after their appearance attacked by green lice, and psimires; I made the same application, which effectually removed them.

The same has been done to my apple orchard (with the exception of topping); and I am fully convinced, that nothing can be applied, which gives the bark so healthy an appearance, and so smooth a surface as the above treatment; the attack of the smallest insects in summer is prevented by the alkali contained in the soap, and the smoothness of the bark prevents the deposit of their eggs.

I have likewise applied a strong decoction of tobacco leaves which may be as effectual against vermin, but not so beneficial to the health of the tree.

Your obt. servt.

Danvers, Aug. 3, 1831. WM. P. ENDICOTT

NEW FRUITS.

Copy of a letter from Sheldon Moore, Esq. of Connecticut to Wm. Prince and Sons of the Lin. Bot. Garden, dated 28th March, 1831.

GENTLEMEN—Herewith you will receive scions of three sorts of apples together with a specimen of the fruit of one of the kinds, viz. the *Steele Sweet*. The scions marked *Moore's Greening* are from a seedling tree, the only bearing tree now in being; many scions have been taken from it within a few years. It is a young flourishing tree the only very valuable kind from an orchard of perhaps 75 trees or more. It is uniformly a real bearer each alternate year. The fruit is of fair size, pleasant, though not of the highest flavor, very fair, and keeps remarkably well; it is little apt to be defective at the core (not to rot) but on the whole we consider it rather superior to any

winter apple for farmers that we have. We have several of the celebrated kinds, as R. I. Greenings, Spitzenburgh, Pearmain, &c. Last year was the bearing year, which is the reason I send no specimens of the fruit. The scions marked *Steele Sweet* are of a kind said, and I presume truly, to have originated in this town, as they bear the name of a family by whom they are supposed to have been first raised. They keep much better than winter apples generally and are much cultivated here. They are not so large and fair generally as the sample but we consider them for our use superior to the kinds that I mentioned we have.

The scions labelled *Hart's Early Sweet*, are of a kind supposed to be a native of this part of the country though I am not certain that such is the fact. It is not the earliest apple, but ripens however several weeks before fall apples generally, and is remarkably fair, large and fine flavored; there is no uniform name for it, but I have added the name of the man who I believe first raised it as an adjoining town. The tree grows with a smallish bushy top and bears not very abundantly though tolerably so; but I think it well worthy of cultivation. I have put them down in the order I should esteem them, and also of the proof of their being peculiar to this part of the country. Of the first I am positively certain that it is a new sort. The second, there is not much doubt about, but of the third there is more. The two last more disseminated and may have become known in other parts of the country by different names. With my best wishes for success in the important objects in which you are engaged,

Respectfully yours, &c.

Note—The scions were grafted on thirty stocks, six feet from the ground and have grown vigorously.

Lin. Bot. Garden,
July 29, 1831.

WM PRINCE AND SONS.

STONE BRIDGES.

MR FESSENDEN—I wish to say a few words on a subject of some importance which I have not seen discussed in the *New England Farmer*; and in this day of improvement I have thought it strange that all have been silent on the subject. I allude to the great importance of good and permanent *Stone Bridges*. It is well known that in travelling over our country roads we are constantly passing streams of water, even the smallest of which requires a bridge for passing; we shall find most of them built with wood, an article more costly now than fifty years ago; we also frequently know of damages and accidents caused by bad bridges, and sometimes a large fine for the town to pay. Now I would recommend to all the towns in the Commonwealth to build from year to year as they become able, good *Stone Bridges*. All our towns have rocks and stone in abundance and have men that are able to execute the work; the small bridges may be covered on the top with flat or split rocks—and over the next larger streams the bridge should be built with an arch the dimensions to correspond to the quantity of water in the spring of the year. Streams like Charles or Concord River, would require two or three arches.—Our well informed farmers are well satisfied that

rocks make the best and cheapest fences on our farms, and if that is the case, *Stone Bridges* will be found to be the cheapest in the end.—No doubt a good stone bridge well covered with gravel will last a thousand years. I think upon reflection this will be found to be an important subject and well worthy of more attention than it has hitherto received.

A CONSTANT READER.

IMPORTANCE OF EARLY SOWING.

MR FESSENDEN—Having noticed for a number of years past that late sowing or planting seldom answered as well as early, my belief has been more strengthened of late by the following facts.

On the 15th July, 1830, I sowed on a piece of ground of about one and an half acres, six pecks of buckwheat, and the same quantity of rye, mixed and sowed together; I also at the same time sowed clover seed in the chaff on the same piece, and harrowed the whole in. The clover took and grew well: the buckwheat was harvested at the usual time, but owing to the severe drought it produced but an indifferent crop; the rye grew large and branched out full, some of the stalks, were more than eight feet long, a number of the stools produced sixty, eighty, ninety, and one, one hundred and ten stalks with one hundred good ears or heads. One stool was taken up on the 2d instant, and shelled on the 9th, and counted by two respectable witnesses, and the number of grains was seven thousand two hundred and eighty five, and measured about half a pint from a single grain.

If you think the above worth publishing you can give it a place in the *New England Farmer*.

SETH CORCH.

Kingston, Ulster co. N. Y. July 20, 1831.

MR FESSENDEN—I have noticed in the *New England Farmer*, vol. ix. page 388, that to put charcoal about the roots of Peach Trees would be a preventive against insects, worms, &c. I have thought it proper to state that my trees are all planted on newly cleared and well burnt land, and I find most of them are more or less affected with worms at the root, so that I fear charcoal may not prove infallible, though my case is not decisive.

August, 1831.

It is interesting for farmers who raise Silk Worms, to know, that Cocoons, by being kept loose considerably of their weight. A person who made fifteen pounds this season, after keeping them a few weeks, found them reduced to twelve. This is occasioned by the dissolution of the dead chrysalis, which at last is reduced to powder. It is therefore the interest of those who have cocoons on hand, to dispose of them as soon as possible, otherwise they will suffer loss. Cocoons do not, like wine, improve by age; on the contrary, the longer they are kept, the harder they are to reel. —*Amer. Daily Adv.*

The Rochester Republican states that 50,120 acres of wheat were cut in Monroe county, New York. This, it may be observed, was the product of one county, and if taken at 20 bushels to the acre, and the average price one dollar per bushel, the return for wheat alone must exceed \$1,000,000! So much for canals.

Horticulture.

Proceedings of the Massachusetts Horticultural Society at a meeting, held in the Hall of the Institution, on the 6th of August, 1831.

The following report was read. The Committee on the Library ask leave to report, that a Catalogue of the Books, belonging to the society, has been prepared, and is herewith annexed.

It appears, on a thorough examination, that several books have not been returned, in conformity to a resolution, which was passed several months since, and published in the *New England Farmer*; and many of the numbers of London's *Gardener's Magazine*, the *Pomological Magazine*, the *Transactions of the London Horticultural Society*, the *Annales de la Societe d'Horticulture de Paris*, the *Annales de L'Institut Horticole de Fromont*, and of the *Floral Magazine* are still in the possession of some of the members, who should be requested, by public notice in the *N. E. Farmer*, to send them to the Librarian, as it is necessary that the numbers of the periodical publications should be collected, and bound into volumes, before they are again allowed to be taken from the Library.

The works on Fruits and Flowers, which are embellished with engravings, the Librarian has been directed to retain, as they are required by the Committees on Fruits and Flowers, to enable them to identify the names and characters of such samples, as may be presented for exhibition, or premium, during the season the Hall is opened for those purposes.

Respectfully submitted by the direction of the committee.

H. A. S. DEARBORN,
Chairman Library Com.

Horticultural Hall,
August 6th, 1831.

CATALOGUE OF BOOKS

IN THE LIBRARY OF THE

MASSACHUSETTS HORTICULTURAL SOCIETY.

- Abercrombie, J. Practical Gardener, 12mo.
Gardener's Pocket Jour. 21mo.
Adlam, John. A Memoir on the cultivation of the Vine, 12mo.
Aiton, on Live Stock.
Anderson, on Gardening.
Annales de la Societe D'Horticulture de Paris 6 vols. Svo.—two copies.
Annales de L'Institut Royal Horticole de Fromont, Svo. two copies.
Bontcher on Forest Trees, 4to.
Bigelow, Jacob, American Medical Botany, 3 vols. Svo.
Bigelow, Jacob, Plants of Boston and its environs, Svo.
Blake, Stephen, English Garden, 12mo.
Bliss, G. Fruit Grower's Instructor, 12mo.
Bradley, on Gardening, 12mo.
Bryant, G. Flora Dietetica, or History of Esculent Plants, Svo.
Cours de Agriculture, 16 vols. Svo.
Chaptal, M. Le Comte, Chimie Appliquee D'Agriculture 2 vols. Svo.
Culture de la Vigne, 2 vols. Svo.
Cobbett, William, Gardener, 12mo.
Cook's Tables for Farmers and Graziers, Svo.
Curtis on British Grasses, Svo.
Cox, William, Cultivation of Fruit Trees, Svo.

- Cully on Live Stock, Svo.
Cruckshank on Forest Trees, Svo.
Davy, Sir Humphrey, Elements of Agricultural Chemistry, Svo. two copies.
Deane's New England Farmer, Svo.
Delapierre, Deocade, Traite de Culture Rurale. 2 vols. 12mo.
Boiset Forest 24mo.
Drummond's First Steps to Botany, 12mo.
Darwin's Phytologia, Svo.
DuRoi, Plantations des Arbres, 4to.
Physique Des Arbres 2 vols. 4to.
Trait Des Arbres Fruitiers, 7 vols. folio.
Evelyn, John, Silva, or Discourse of Forest Trees, 2 vols. 4to.
Complete Gardener.
Forsyth, William, A Treatise on the Culture and management of Fruit Trees, Svo.
Fessenden, Thomas G. New American Gardener, 12mo.
Farmers' Tables.
Griffith, Mrs Mary. Our Neighborhood or Letters on Horticulture, 12mo.
Hints on American Husbandry, by the Directors of the Pennsylvania Agr. Society Svo.
Hayward, Joseph, Horticultural Science, Svo. Horticultural Essay.
Haynes, on the Strawberry, Raspberry, Gooseberry and Currant, Svo.
Holland's General View of the Agriculture of Cheshire, Svo.
Hosack and Francis' Medical and Philosophical Register, 4 vols. Svo.
Hosack's Medical Essays, 2 vols. Svo.
Hosack's Memoir of De Witt Clinton.
Hipburn, John, American Gardener, 12mo.
Holton, M. Manuel de L'Elevageur, 12mo.
Hooker, William, Pomona Londinensis, 4to.
Horticultural Tracts, 1 vol. Svo.
Lawrence on Gardening, 12mo.
Linnæus, Carolus, System of Nature; translated by William Turton, 7 vols. Svo.
Louden, J. G. Encyclopedia of Plants, Svo.
Laying out Landscape Farms, fol.
Hot Houses, folio.
Country Residences, 2 vols 4to.
Encyclopedia of Agriculture, Svo.
Encyclopedia of Gardening, Svo.
Gardener's Magazine, 3 vols. Svo.
Lemoine, L. Arbres a Fruits, 24mo.
Mc Mahon's American Gardener, Svo.
Marshall on Gardening, 2 vols. two copies.
Planting and Rural Ornament, 2 vols. Svo.
Madcock, James, Florists' Dictionary, Svo.
Michaux's North American Sylva, 3 vols. Svo.
Michaux, A. Flora Boreali Americana, 2 vols. Svo.
Martin, Phillip Gardener's Dictionary, 4 vols. folio.
Mowe, T. Gardener's Calendar, 12mo.
Merault, A. J. L'Art Du Jardinier, 12mo.
Mear, J. Gardener's Companion, 24mo.
New England Farmer, 9 vols. 4to.
Nuttall's Travels in Arkansas, Svo.
Introduction to Botany, Svo.
Naturalist. A periodical publication.
Nicol, Walter, Gardener's Calendar, Svo.
Planters' Calendar, Svo.
Practical Planter, Svo.
Villa Garden Directory, 12mo.

- Noiset, L. Manuel de Jardinier, 4 vols. Svo.
Pomological Magazine, 2 vols. Svo.
Pantey, W. Forest Pruner, Svo.
Profitable Planter, Svo.
Rural Improver, 4to and a vol. of Plates, 4to.
Phillips, Henry, History of Cultivated Vegetables, 2 vols. Svo.
Sylva Florifera. Shrubbery, Ornamental Planting and Picturesque Scenery, 2 vols. Svo.
Pomerium Britannicum, Svo.
Prince on Horticulture, 12mo.
Prince's Treatise on the Vine, Svo.
Philippar, Fr. Voyage Agronomique en Angleterre, Svo.
Port folio of colored engravings of Fruit.
Quintainye on Gardening, fol.
Repton's Letters on Landscape Gardening, Svo.
Sketches and Hints on Landscape Gardening, Svo.
Designs of the Pavillion at Brighton, Svo.
Speechly on the Vine and Pine Apple, Svo.
Say's American Insects, 3 vols. Svo.
Sinclair's System of Husbandry, 2 vols. Svo.
Southern Agriculturist.
Silk Culture, by Felix Pascalis, John D'Homerque and Stephen Du Ponceau, Svo.
Sweet, Robt. Florist's Guide, Svo.
Thouin, A. Cours De Culture, 3 vols. Svo. and an Atlas.
Thouin, Gabriel, Plans Raisonnees de Toutes les especes de Jardins, folio.
Transactions of the London Horticultural Society, 6 vols. 4to. and nos. 1, 2 and 3 of vol. 7.
Thatcher's Orchardist, 12mo.
Thatcher's Treatise on Bees, 12mo.
Weston, R. Gardeners and Planters' Calendar, 12mo.
Wilson, Alexander, American Ornithology, 3 vols. Svo. and 1 vol. of Plates.
Wheaton on Gardening, Svo.
Worridge on Cider, 12mo.
Yang, A. Farmers' Calendar.
General View of the County of Norfolk, Svo.
Vetenat, E. P. Nouvelle Plantes, 4to.

The following letter was read by the President.

Gibbs, June 7, 1831.

SIR,—By your communication of the 6th of December last, I was made acquainted with the honor conferred upon me, by the Mass. Hort. Soc. in electing me as Corresponding Member, and at the same time I received its Diploma.

Though domiciliated on this sterile rock, for some twenty years, without an opportunity to speculate on the subject of Horticulture, yet such are my impressions, imbibed in my native country connected with rural economy, that I cannot but feel highly gratified, by the attention shown me, and excited to use every endeavor in my power to meet the views of an association, the basis of which, is the public good.

I may at times be enabled to afford something, the growth of this neighborhood, worthy a place in a Botanical Garden, and shall be happy to learn that such a useful establishment has been founded, in the vicinity of Boston. Such gardens

are general throughout Europe, and their beneficial influence universally admitted. They are accessible to all, and thousands are thus excited to explore the vegetable kingdom, who are continually making collections of valuable plants, or extending the bounds of horticultural science.

I have the honor to be with profound respect, your obedient servant,
H. A. S. DEARBORN, Esq. Pres. Mass. Hort. Socy.

A package of seeds was presented by Mrs Doct. Channing, which she collected in the West Indies.

Resolved, That the thanks of the Society be presented to Mrs Doct. Channing, for the valuable collection of seeds, which she has kindly bestowed upon this institution.

Resolved, That the above named seeds be placed in the hands of the Curator of the Botanical Garden in Cambridge, and that he be requested to report the result of his experiment, in cultivating them.

Horticultural Hall, }
Saturday, August 6, 1831.

FRUITS EXHIBITED.

APPLES.—A remarkably fine specimen of the Sopsavine, (Shropshirevine?) from Mr E. Vose.

PEARS.—Early Catharine, (of Bloodgood's catalogue,) Grosse Chaise Madame, Summer Bergamot, (Coxe, No. 5.) English Red Cheek, (generally known as the English Catharine,) and Windsor Pears, from Mr Manning.

APRICOTS.—Early, (of Coxe,) from Mr E. Vose, and several boxes, (supposed to be the Roman,) from Dr Rollins. S. DOWNER, Chairman.

FOR THE NEW ENGLAND FARMER.

MR FESSENDEN—In your paper of Aug. 3, I observed some remarks upon an extract from the Christian Examiner on the 'Mortgaged farms of N. England.' Although some ideas there expressed may be founded in truth, yet I think the spirit in which the article was penned was bad, and the principles there laid down are unsound, and will have a very injurious tendency wherever they are received. 'A Farmer' says, 'I think all those who reflect candidly, unbiassed by prejudice, and from a desire to come at the truth of the matter in regard to political equality, will perceive that all the *real equality* that any government can give a people is the *privilege of gaining access to the highest honors and emoluments through merit, or to leave each individual of a nation in perfect freedom to pursue the path which best suits him, to wealth and distinction, so far as he injures no one else*.' Any other scheme cannot but be productive of bad results, and prove in the highest degree injurious to the community.

I do not imagine that the 'suggestion of saving the land from an evil of such widely spread and increasing magnitude,' by a willingness on the part of those alluded to, to perform the duty of domestics, is correct, but yet I do believe, and every one who will take the trouble to look around him will perceive that most of our troubles and perplexities in business, &c., are brought upon us by an unwillingness to appear for what we really are, from a false pride which prevents us from performing the duties of the situation in which Divine Providence has placed us, and conforming to the circumstances of our condition. We wish to make the world to believe that we can live as well, dress as well, and procure the same luxuries as our more wealthy neighbors. We run before we ought to creep, therefore to wonder we come to the ground; but this is not *dignity*, we are blinded if we think so. True dignity influences us to perform to the very best of the ability with which we have been endowed, our *daily and apparent duty*, not to disgrace the situation we are in, but to elevate it; there is no situation in life, while virtue and innocence are our companions, that

is disgraceful, but all are honorable. The lowest calling upon earth, if performed from right feelings, will ever command respect and esteem, even from those whom Providence has raised to the highest stations of wealth and power. Many who employ 'help' in their families are overbearing and disposed to trample upon those in their power; yet is this a good reason why a daughter of a 'substantial farmer,' or any other person's daughter, should consider as a 'degrading servitude,' or as 'the sorry employment of gathering crumbs from the rich man's table,' the situation of domestic in a family? We are deceived; it is our own fault if we are not respected.

Let us look into the history of independent and flourishing families, and we shall see the father whose industry has been blessed with pious success, and the wife who graces the board that is loaded with hospitable cheer, were one or both servants in their youth to such as they now are.

The great end in the education of every female should be to fit them to become good wives and prudent housekeepers, and if a young woman is so situated as to be under the necessity of learning in another house than her father's, certainly it can be no disgrace to her, but an honor if she performs her duties with fidelity and cheerfulness.

There is one consideration which I have never heard advanced in favor of young women's becoming domestics who are obliged to earn their daily bread, which is a very important one. In this situation they are every day better qualified for good wives, and of course increasing the opportunities of becoming so.

A sensible man is not generally attracted by her who is ignorant or out of the performance of domestic duties; for to one who has congenial qualities and is happy and at home in household affairs, he will look for happiness. I wish not to be personal, but I think the sentiment 'I would sooner, infinitely sorer, follow my daughters to the grave than see them go out to service,' cannot originate in a good spirit or sound principles, and that pride is at the root of it.

In regard to domestics, much might be said, and I wish, Mr Editor, you would give your readers some of your cogitations upon the subject, with an endeavor to devise some method of placing it in its true light, and of helping those who are in want of help.

OLIVER.

REMEDY FOR RED ANTS.

MR FESSENDEN—As there is great complaint in the papers respecting the little nauseous red ant that infests the closets and dairy rooms of farmers, I beg leave to ask you to republish from the New England Farmer of Sept. 10, 1830, page 64, a complete remedy that you then copied from Mrs Child's invaluable 'Frog and Housewife.' I have tried it in a closet, and in a large cheese room, and find the ants will leave everything for the walnuts.

'It is unnecessary to tell any who have had experience of the evil, that *red ants* are like the plagues of Egypt. The following method of destroying them seems to be too simple to be very effective; but I have known it succeed, when a house had been infested with them for years.

These insects are extravagantly fond of shag-barks, or American walnuts: fill a large dish with these nuts, cracked, and they will quit everything else, to cluster upon it. When the dish is well covered, remove it carefully, and brush them all into the fire; at the same time have a little *corrosive sublimate* in a cup, to sweep in such as happen to stray from the dish; and touch all the cracks and crevices, from which you have seen them come with a feather, dipped in the same poison. In one week if this be repeated they will all be gone. By no means leave the cup, or poisoned feather about for an instant.'

PASTURE OF PLANTS.

Every plant requires a given quantity of earth to nourish it, into which its roots extend for that purpose; and the quantity thus required is called the requisite *pasture* of the plant. Some require more earth, and some less. Some require a greater superficial extent with less depth; while others require a greater depth with less superficial extent.

For instance, a plant of Indian corn requires a superficial extent of say, three feet in circumference, and a depth of six inches; while a root of the beet, carrot, or parsnip kind, requires a superficial extent of, perhaps, only twelve inches in circumference, but a depth of say, fifteen inches. A plant of flax, on the contrary, will not require more than six inches in circumference, and five inches in depth.

It will probably be found, that the greater depth is given to all plants, the less circumference they will require; that the roots will, in that case, shoot further downwards; and, therefore, the deeper you plough, the thicker you may sow. This is a matter of nice calculation, and well worth the attention of the ingenious Farmer.

In order to elucidate this, the proper method is, to try various plants in beds of the same soil, culture, and dimensions, but dug of different depths, and the plants set at different distances, and then the results will lead to the truth.

Thus, for instance, make four beds of carrots, which shall be dug equally well eight inches deep; let the roots in the first bed stand at the distance of four inches from each other; those of the second, at the distance of six; those of the third, at the distance of eight; and those of the fourth, at the distance of twelve inches; and then let it be ascertained which bed has the greatest weight of carrots.

In the meantime, have four other beds dug twelve inches deep; and four more dug eighteen inches deep; and plant one of each of them at the respective distances above mentioned, and ascertain what is the result of each. The same experiments can be tried with equal exactness on most other plants, and the results equally well ascertained.

LABOR SAVING.—It is stated that 20,000 copies of the London Atlas were struck in a few hours. A computation has been made that the printed surface was equal to about 20 acres, and that it contained sufficient matter for 14,230 octavo volumes of the ordinary thickness. Divided into columns, placed end to end, the length would encompass Middlesex, and the seven surrounding counties. The whole of this labor was performed by three boys with a four horse steam engine. There are men, who manifest some understanding on other subjects, and yet, who propose to dispense with labor saving machines, in order to give employment to workmen. This is a mistaken notion, and if applied *in extenso*, would carry us back to the early imperfection of machinery. One step backwards involves an entire retrograde. Which of the early, imperfect presses could be fixed upon—or would they dispense with printing presses altogether? To maintain consistency, they ought to dispense with types also. It really would seem that some of these free-trade anti-American system philosophers would take from us all we have, with the exception of our 'teeth and nails.'—*Detroit Courier*.

MUD.

Mud, a black or dark colored sediment, found at the bottom of ponds, rivers, creeks, ditches, and wet sunken places. It is mostly composed of a fine vegetable mould, mixed with the substance of perished vegetables, &c., and therefore it contains much of the natural food of plants.

In ponds and rivers, this sediment is made up of fine dust, together with a rich variety of other substances, which have been wafted in the air, and have fallen into the water; together with the subtlest particles of the neighboring soils washed down into them by rains. That is supposed to be the richest mud, which is near to the borders, and which has been alternately flooded and fermented; as it will ferment when it lies bare, in some degree.

In rivers, and in long ditches that have currents, there is a greater proportion of soil in the mud. It has been brought down from soft, mellow lands, through which the rivers pass; and some of it doubtless from beds of marl, which are often found in the banks of rivers, and which readily dissolve in the water.

Some ponds are totally dried up in a hot and dry summer; and all ponds and rivers are so diminished by a copious evaporation, as to leave part, and the richest part, of their beds uncovered. And these beds, where there has been no rapid current, are always found to contain rich mud. In some places it reaches to a considerable depth. This mud, though taken from fresh waters, has been found to be a valuable manure; more especially for dry, sandy and gravelly soils. I have known it to have as good effect as barn dung, in the culture of Indian corn, upon such soils. The advantage of it is not found to be only for one season; it meliorates the land for several years. It restores to a high piece of ground what vegetable mould the rains, in a long course of years, have been washing away from it.

It is happy for the farmer that Providence has prepared for him these magazines of manure in all parts of the country. None but the stupid will let them lie unnoticed, or unremoved. When a dry autumn happens, the prudent farmers will be very industrious in carting mud up from evaporated ponds, and other sunken places in their farms, and laying it upon their light soils, especially upon high gravelly knolls; or into their barn yards, if the distance be not too great.

But with respect to using mud as a manure, the maritime farmers have the advantage above all others. For the sea ooze, which appears on the flats, and in creeks and harbors, along the shores of the sea, has all the virtues of fresh water mud, that of sea salt superadded, which is one of the most important ingredients in the composition of the best manures. I might add, that it abounds, more than any other mud, with putrefied animal substances. Much of these are contained in the sea itself: and innumerable are the fowls and fish that have perished upon flats since time began; and the component parts of their bodies have been inclosed by the supervenient slime.

Mud taken from flats where there are shell fish or even where they have formerly lived, is better for manure, than that which appears to be more unmixt. The shells among it are a valuable part of its composition. If it abound much with shells, it becomes a general manure, fit to be laid upon almost every kind of soil.

That mud, however, which is a richer manure

than any other, is taken from docks, and from the sides of wharves in populous towns. For it has been greatly enriched by the scouring of foul streets, and from common sewers; as well as from an unknown quantity of animal and vegetable substances, accidentally fallen, or designedly thrown into such places.

Sea mud may be taken up at any season, whenever the farmer has most leisure. It is a good method to draw it up on sleds from the flats in March, when the border is covered with firm ice. I have thus obtained mud from flats, with great expedition and little expense.

Mud that is newly taken up, may be laid upon grass land. But if it is to be ploughed into the soil, it should first be exposed to the frost of one winter. The frost will destroy its tenacity, and reduce it to a fine powder; after which it may be spread like ashes. But if it be ploughed into the soil, before it has been mellowed, it will remain in lumps for several years, and be of less advantage.

A layer of mud will be no bad ingredient in a heap of compost. But it should be contiguous to a stratum of lime, if that can be obtained. But where this is wanting, new horse dung is the best substitute, to excite a strong fermentation.

The best method of managing all sorts of mud, were it not for increasing the labor, would be to lay it in farm yards, and let it be thoroughly mixed with the dung and stale of animals. When it is so managed, the compost is excellent, and fit for almost any soil, though best for light ones. Perhaps the advantage of it is so great as to pay for the increased expense of twice carting. For it will absorb the stale of cattle, and retain it better than straw, and other light substances.

From the Ravenna (Ohio) Courier.

VALUABLE DISCOVERY.

By a communication received from a respectable and scientific Physician in Medina county, we learn that a remedy has at length been found for restoring animation suspended by the effects of carbonic acid gas, or *damps*, as it is usually termed, in wells. The frequent occurrence of death, caused by persons descending into wells in which this gas, or *damps* exists, has long made it a desideratum with the humane to discover a restorative to animation when it is suspended by inhaling the gas. Accident has at length done what science and study had failed to effect; and if we cannot at all times avoid the gas, we can, by timely aid, prevent the fatal consequences of its effects.

On the 17th of June last, three individuals, a Mr Vial, his son, and another person, were engaged digging a well in the Township of Copley, Medina County, and having been absent about one hour, on returning, the young man went into the well, and after descending a short distance, fell apparently lifeless to the bottom. His father immediately descended to his relief, and having arrived at the region of the *damps*, also fell to the bottom in a similar condition. On seeing them apparently lifeless, the third person, started in great haste for the physician, (our informant) who resided at some distance from the place. During his absence, several ladies who were assembled at the place, determined to make an effort to raise the bodies from the well. One of them threw a pailful of water down—most of which fell on the face of Mr Vial, who immedi-

ately caught breath, and rising on his feet, he seized the breathless and apparently lifeless body of his son, and with it in his arms, succeeded in getting into the bucket or tub, in which situation they were raised to the top of the well by the women. Water was immediately applied to the young man, which in a short time produced symptoms of returning life. Mr Vial in a few hours attained his usual health and strength, and the young man, by medical aid, had so far recovered as to be able to walk about on the succeeding day.

The experiment of letting down a candle was then tried, which went out at the depth of six feet from the top of the well—a live chicken was also let down, and at the depth of six feet animation became suspended, but by pouring down water on it, animation was immediately restored. From these experiments it appears that on inhaling this gas, life is not immediately extinguished, but suspended only, and that the application of water will restore it—whether by conveying atmospheric air, contained in the water, to the sufferer, or from some other cause we are not sufficiently scientific to determine.

Numerous valuable lives have been lost within the circle of our acquaintance by exposure to these *damps*, and we hope the preventive now suggested will be fairly tested, and if found to be a general restorer of suspended animation in cases of this kind, that a knowledge of its efficacy will be widely diffused.

A Mole of destroying the Red Spider on plants.—Sir—As you are very desirous that all gardeners should not only be reading but writing gardeners, I, for the first time (being very young), venture to take up my pen to write a few lines, and shall be very happy should you think them worthy of insertion. The subject on which I now write is the red spider, which is very common on certain stove, green-house, and, in dry seasons, certain hardy plants. I have heard and read many receipts for the destruction of this insect, but I never found a more powerful remedy than clear water. I have under my care a few stove plants, which are in general in a very healthy state. I syringe them every morning with clear water on both sides of the leaf, and the plants are not in the least affected by this destructive insect. I had, for instance, a species of Plumbago that was much infested by the red spider; but after I had syringed it well for a few mornings, there was not an insect to be found on the plant. I verily believe that clear water, applied as before observed, will effectually destroy the red spider; and, if constantly used, it will preserve any plant from this destructive insect. I think that if stoves or green-houses devoted to the culture of exotics were steamed well every night (water being applied in the form of steam), the plants would never be attacked by the red spider.—*Gardener's Mag.*

Temperance Societies—are established in every county in Pennsylvania, and are so well organized, as to produce the happiest results. Their influence is perceptible everywhere. The work of reformation among the laboring classes of society, is most conspicuous—a drunken man is, locked upon in many parts of the state, as an outcast from society; deserted by his former associates, he is compelled to quaff the bowl in solitude, and suffer himself to be pointed at by the finger of scorn, or to reform!—*Poulson.*

From a New York paper.

WHEAT.—AN EXTRACT.

'While resting on my hammock [in the open air] I could discern the progress of cultivation, which was more contiguous than in the position from which the fields were first described; and, upon particular inquiry, I found that every process of agriculture was in operation, at the same time: at the east extremity, the mules were *hoing* off the harvest, to the depots behind the dwelling; stacks were on the patch of ten or twenty acres, next adjoining; another patch displayed the rows of sheaves; in another, the reapers were at work, and the young people tying them; farther on the golden harvest tempted the reaper; and still farther west the waving grain had got its tinge of pale green; and farther still, the tint was more deep, it was the grain in the blade; another patch appeared to show like green thread upon a cake of chocolate; and next appeared the *paissano*, scattering the grain, followed by a range of mules abreast, with that harrow which instinctive reason provides, in the thorny brambles of the thicket: last patch of all, the ploughman with his *rude formed plough*, though then too distant to be particularly described: this was the rotation of crops; and upon a soil which never had any other manure than the rains and dews of Heaven and its own natural composition; the progression unceasing and uninterrupted, unless the hand of man forgot or neglected to do its duty. But the want of roads to transport those rich harvests rendered their mercantile value small; wheat could be had here for about a real and a half, or fifteen cents the bushel; barley for ten; peas, vetches and beans for a few cents.' Col. Duane's *Visit to Colombia*, pp. 325-6.

I ask every advocate of the free trade system, who shall read the foregoing extract, and fully understand the extraordinary faculty of raising wheat, &c above described—where it may be sown on any and every day of the year, and reaped also on any and every day—and that even on the same extensive plantation—whether he would be willing to admit wheat, &c into our ports free of duty from Colombia, when the time shall have arrived, that they, by good roads, canals, and other facilities of transportation, shall be enabled to bring it to us, with only a small enhancement beyond the cost of this commodity on the soil that produces it? Could our agriculturists meet such a competition and afford flour at the low price at which it would then necessarily come? Or is it pretended, that we must raise no wheat, when such an event arrives? Is it to be a part of our national policy to buy our own bread stuff?

So also I might ask if cotton is to be admitted free of duty, from countries which produce it, with facilities as much superior to those which our cotton planters possess, as is shown in the case of wheat above mentioned by Col. Duane. In Colombia, cotton is produced by a tree, like an apple-tree in size, without planting or cultivation—whereas, the cotton of our southern states, grows on a plant of annual growth, and requiring cultivation. When the new governments of South America, shall have advanced in such improvements in the arts and government as shall enable them to send their cotton to the markets of the world, at a low rate—do our southern cotton planters think they could compete with producers having not only the advantages just mentioned, but another and most extraordinary advantage, one eternal

and uninterrupted season, adapted to their agricultural operations? Or are we to buy all our raw cotton and raise none?

Need more be said to show that our soil and advantages, natural and artificial, are inferior to those of other nations. Nevertheless, we must take them as we find them, and at the expense of restriction, draw from them our subsistence, comfort and happiness; that any other policy would lead to the breaking down of every pursuit or occupation, which by climate or any other natural or fictitious disadvantage, shall appear to have less favorable facilities for its prosecution, than may be found in some one foreign country or another. In fact, the proverb that he who wants things as cheap as they are in China, must go to China, for them, and then he may find them and use them, seems to have a forcible application here. If the cotton planter, should desire to eat the wheat of Colombia, at 15 cts. per bushel, rather than pay to his countryman 80 or 100 cents, our wheat farmer might well advise him to emigrate to Colombia, rather than to reside in one region of the earth, and draw his bread stuffs from another. And the wheat farmer, if he should desire to have cotton at a lower price, than the actual facilities of his own native country can afford, might also receive the same advice from the cotton planter.

From the Journal of Health.

THE AMERICAN AQUATIC.

We beg leave, before explaining the origin of the title, and to whom it was applied, to repeat one of the 'Hints to Mechanics and Workmen,' which we gave in our first volume, p. 351. 'Abstain from ardent spirits, cordials, and malt liquors—Let your drink be like that of Franklin, when he was a printer—pure water.' This advice of ours, given with a sincere desire to benefit those to whom it was addressed, and with a full knowledge that its adoption would be productive of practically beneficial effects, was carpied at by some who could not separate truth from error, nor pernicious from salutary habits. Excusable by their ignorance, we mean not now to censure them, but to show on what foundation, and with what propriety, we appealed to the example of the illustrious Franklin.

In the sketch of his life written by himself, this great man relates, among other matters respecting his residence in London at the time in which he was a journeyman printer, the following dietetic particulars—

'On my entrance I worked at first as a pressman, conceiving that I had need of bodily exercise, to which I had been accustomed in America, where the printers worked alternately as compositors and at the press. I drank nothing but water. The other workmen, to the number of about fifty, were great drinkers of beer. I carried occasionally a large form of letters in each hand, up and down stairs, while the rest employed both hands to carry one. They were surprised to see, by this and many other examples, that the American Aquatic, as they used to call me, was stronger than those who drank porter. The beer-boy had sufficient employment during the whole day in serving that house alone. My fellow pressman drank every day a pint of beer before breakfast, a pint with bread and cheese for breakfast, one between breakfast and dinner, one at dinner, one again about 6 o'clock in the afternoon, and another after

he had finished his day's work. This custom appeared to me abominable; but he had need, he said, of all this beer, in order to acquire strength to work.

'I endeavored to convince him that the bodily strength furnished by the beer, could only be in proportion to the solid part of the barley dissolved in water of which the beer was composed; that there was a larger portion of flour in a penny loaf, and that consequently if he ate this loaf, and drank a pint of water with it, he would derive more strength from it than from a pint of beer. This reasoning, however, did not prevent him from drinking his accustomed quantity of beer, and paying every Saturday night a score of four or five shillings a week for this cursed beverage, an expense from which I was wholly exempt. Thus do these poor fellows continue all their lives in a state of voluntary wretchedness and poverty.

'My example prevailed with several of them to renounce their abominable practice of bread and cheese with beer; and they procured like me, from a neighboring house, a good basin of warm gruel, in which was a small slice of butter, with toasted bread and nutmeg. This was a much better breakfast, which did not cost more than a pint of beer, namely, three half pence, and at the same time preserved the head clearer. Those who continued to gorge themselves with beer often lost their credit with the publican from neglecting to pay their score. They had then recourse to me, to become security for them; their light, as they used to call it, being out. I attended at the pay-table every Saturday evening, to take up the little sum which I had made myself answerable for; and which sometimes amounted to nearly thirty shillings a week.'

Franklin always had a cool head—he was ready for every emergency; he acquired a reputation as a philosopher and statesman, which has given his name currency over the whole civilized world. Surely the example of such a man is more worthy of imitation than that of the various classes of boozy songsters—convivial jokers—pretenders to social enjoyment at the expense of head and heart—canters of liberality—servile imitators of the vices of genius, and admirers of the degradation of their species, which they qualify with the specious epithets of civilization, refinement, taste, and the like.

On Grass Lands, Clover Sowing, &c.—It is admitted on all hands that one of the most difficult parts of the farmer's duty is 'laying down' regularly and successfully grass lands. John H. Povel, an intelligent and experienced Farmer of Pennsylvania says that in this country there is not usually more than half the quantity of seed sown that should be to insure success—that from experience he has found that three half pecks of cloverseed mixed with two bushels of orchard grass seed is in no instance too much to sow on an acre of land—that by putting in this quantity, by light harrowing and rolling of the ground, if the weather and soil be in a proper state, immediately after sowing, will secure its vegetating and improve the grass. Autumnal top dressing with long manure, may be profitable applied to protect young clover, particularly if it has been pastured. A double advantage is obtained by using abundant supplies of seed; the hay is finer, and of course more nutritious, and when the crop is taken off, the soil is less exhausted from the rays of a hot sun.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, AUG. 10, 1831.

POISONOUS CHEESE.

We have received complaints from several quarters, of distressing and dangerous illness caused by eating cheese, which in some way or other has become very deleterious. Among others a gentleman in Boston, lately wrote to us that 'six of my family were yesterday vomited and remain quite weak by eating a small particle of cheese, which was brought to the city by a Mr —, of

Mr — on Thursday had a little of it which sickened his father, himself and son very seriously.' The writer then mentions several others who were made very sick with it, and continues 'for myself, I never knew such a powerful vomit for some hours, which has made me very weak. This — is said to have sold poisoned cheese a number of times, but to what extent I do not know.'—We omit names as they can be of no use, and the vendor of the article might have been innocent of any intentional crime or misdemeanor. It is said that in the same dairy, where the cheeses are all manufactured by the same person, and in which the same means and materials are used, some of the cheeses will exhibit the properties of a violent emetic and cathartic, and others will be perfectly palatable and wholesome.

We have, almost every year since the commencement of the New England Farmer, published notices of poisonous cheese, and its effects. The injurious properties of such cheese have been attributed to many causes, but nothing certain on the subject, as far as we can learn has been established. Some conjecture that lead in some of its combinations is used for coloring or coloring the cheeses which have been found to be deleterious. But any such use of lead, however compounded or modified ought to subject the person so offending to a punishment, similar to what justice would decree against a malefactor who has poisoned a public well or fountain. Others suppose that the use of copper and brass vessels in a dairy may have an injurious effect on the milk of which the cheese is made &c, &c.

The most probable theory, however, is that which attributes the evil in question to the cows having eaten in their pastures of the plant, called *Lobelia inflata* (Indian Tobacco). A medical gentleman, wrote an article which was published in the *New England Farmer*, vol. ix, p. 51, in which were exhibited facts tending to prove the truth of this supposition. An eminent physician in Boston, who has frequently, in the course of his practice, taken notice of the effects of this emetic cheese, attributes them to Lobelia. Besides, we find no notice in any European work on Agriculture, of cheese ever exhibiting properties similar to cheese of the above description; and we believe that Indian Tobacco, the supposed cause of the above mentioned bad qualities in cheese, is entirely unknown to the eastern continent.

RURAL CEMETERY.

At a meeting of the subscribers for lots in the Cemetery of the Massachusetts Horticultural Society at Mount Auburn, held August 3, 1831, at the Society's Rooms, pursuant to public notice, ZEEDEE COOK, Jun, Esq. was chosen Chairman.

The following gentlemen were chosen to serve

on 'The Garden and Cemetery Committee':—Hon. Joseph Story, Gen. H. A. S. Dearborn, Dr J. Bigelow, Hon. E. Everett, George W. Brainerd, George Bond, Hon. Charles Wells, B. A. Gould, and G. W. Pratt, Esqrs.

The Hon. Joseph Story, Rev. Dr Charles Lowell, Charles P. Curtis, George W. Brainerd, J. T. Buckingham, Dr L. B. Adams, and G. W. Pratt, Esqrs. were chosen a Committee to consider and report at a future Meeting of the Horticultural Society, whether it is expedient to have any, and if any, what, religious ceremonies for the purpose of consecrating the said Cemetery.

The Meeting was then adjourned to the same time and place with the next annual Meeting of the Mass. Horticultural Society.

CHARLES P. CURTIS, Sec. of the Subscribers.

MIDDLESEX AGRICULTURAL SOCIETY.

The Public are reminded that the Committee on Farms, Fruit and Forest Trees, will attend to their duty in the course of a few weeks,—and that application must be seasonably made either to the Secretary of the Society in Concord, or to one of the following

Trustees.—Francis Tuttle, Acton. Amos Wellington, Chelsea. Joseph Blanchard, Dorchester. John Merriam, Bedford. Wm. Winn, Burlington. Israel Porter, Cambridge. Cyrus Heald, Carlisle. Kendall Bailey, Charlestown. Nathaniel Howard, Chelmsford. Cyrus Hubbard, Concord. Joseph B. Varnum, Dracut. Jonathan Bennett, Duxbury. James Draper, East Sudbury. Abner Wheeler, Framingham. John H. Loring, Groton. Elihu Cutler, Holliston. Arba Thayer, Hopkinton. Jonas Munroe, Lexington. Charles A. Wheeler, Lincoln. Timothy Prescott, Littleton. Samuel A. Coburn, Lowell. Eli Rice, Marlboro'. Nathan Adams, Needham. Job Brooks, Needham. Wm. Buttrick, Pepperell. Edmund Parker, Reading. Calvin Sawyer, Sherborn. James B. Brown, Stur. Burrage Yale, South Reading. Thomas Whitney, Jr. Shirley. Josiah H. Adams, Sudbury. William Brown, Taunton. Joseph Buttrick, Tyngsboro'. Nathan Harby, Waltham. Zachariah Reed, Westford. Abijah Thompson, Woburn. John Parker, Billerica. William Cotting, West Cambridge.

The Trustees in the several towns are requested to notify the Secretary of all applications made to them for premiums on Farms.

JOHN STACY, Secretary.

Concord, Aug. 6, 1831.

THE MIDDLESEX CATTLE SHOW AND PLOUGHING MATCH, will be held at Concord, Mass. Oct. 5, 1831. From the appearance and contents of the handbill announcing this exhibition, and our knowledge of the enlightened zeal and ability of the President and Officers of 'The Society of Middlesex Husbandmen and Manufacturers,' we have reason to anticipate a show of more than common interest at the time and place above mentioned. We are happy to perceive that this useful institution continues to receive the attention and patronage of those to whose interest it is so substantially subservient; and hope that their labors will receive an adequate reward in the approbation of an enlightened community.

Hudson and Mohawk rail road.—We understand, says the Albany Argus, that the locomotive, engine performed a trip to Schenectady and returned; and that the return passage, was made in one hour and five minutes.

Mrs Child's 'Frugal Housewife' has reached the seventh edition. Five thousand copies of this valuable work were sold the first year of its publication. Her 'Girl's Own Book' has been highly and deservedly recommended in the London Athenaeum.

CURE FOR HYDROPHOBIA.

We omitted, last week,* one ingredient of the Powder to be given preparatory to the Lobelia, viz. 1 grain of Sal Nitre. We now republish entire, the treatment of the disease by Dr Sanborn, which he adopted, with success.—*Ports, Jour.*

The principal remedy was a strong decoction of Lobelia, given in frequent doses till it operated as an emetic, and continued, but less frequently, afterward.

When first called to the patient, he administered, immediately, while the lobelia was preparing, a powder, composed, for an adult, of 1 grain of camphor, 1 of opium, 1 of sal nitre, and 2 of digitalis, finely pulverized, and given in molasses. Half that quantity he would give to the smallest child.

In a case in which the disease was considerably advanced, he gave the powder once in thirty minutes, three times, and afterward, once in four hours.

*See N. E. Farmer, vol. x, p. 2.

Unprecedented Mowing.—Elijah M. Fox, at Suffield, Ct. mowed four measured acres of grass on the 28th day of July, ult. He began at sun-rise and finished at one hour and twenty minutes before sunset, fresh and in good spirits. There were not less than six tons of hay. Fences were on three sides of the lot, and a heavy fall of rain during the forenoon, added much to the labor. One acre of it, a swale, in which the grass was very heavy and badly lodged, would have been a good day's work for a vigorous mower. There are two or three instances in which an equal surface has been mowed over, but for quantity and quality of labor, this is acknowledged by all to be the greatest feat ever accomplished in this part of the country.—*Albany Argus.*

DYSENTERY.—To a common tumbler full of cold water, add a table spoonful of wheat flour: stir it well together, and drink the whole at a dose. This should be repeated once in an hour or two, until a cure is effected.

While on a visit to the eastern part of the state during last autumn, I experienced a violent attack of the dysentery, which, notwithstanding the use of various medicines common in such cases, increased to an alarming degree. After three or four days' intense suffering, an old acquaintance prescribed the above remedy, which effected a perfect cure in the course of one afternoon. My friend stated that he had seen this simple antidote used in a variety of cases, and that he had never known it fail to effect a speedy cure. A remedy so simple and efficacious should be known to every one.—*N. H. Paper.*

Silk.—The Canadian Courant is endeavoring to stir up the people of that province to the raising of silk. The editor has no doubt that the climate is 'well calculated' for that purpose.

The contractors on the Ohio and Baltimore Rail Road advertise for 1700 laborers at one dollar per day.

Roses, Dahlias, Strawberries and Quicks.

The proprietors of the Albany Nursery have printed a classification of 140 of their finest Roses, according to color, to enable purchasers to select a variety with certainty and economy, with characters indicating the size of the flower, habit and prices. This may be seen at the office of the New England Farmer.

They have imported and propagated many varieties of the finest double Dahlias, which may be selected by the flowers until the frosts of autumn.

They will have for sale, from this time forward, plants of the Methven Strawberry, at \$2.50 per hundred.—Fortyseven of these berries have weighed a pound, and some have measured 4½ inches round. Also many other varieties, for which see catalogue.

They have also for sale, at \$5 per thousand, 50,000 quicks of the honey locust (*Gleditsia triacanthos*) for live fences, two years old, and fit for transplanting.—Specimens of the fence may be seen at the Nursery.

Orders for any of the above, or for trees, shrubs and plants, may be sent by mail, or left with J. B. Russell.

BUEL & WILSON.

Albany Nursery, July 16, 1831.

Aug. 10. 31

Zinc Milk Pans.

For sale at the Agricultural Warehouse—Westfield's patent Zinc Milk Pans. A particular account of this great improvement in dairying will be found in the New England Farmer for July 6, 1831, page 405, and many other journals. Milk in these pans will keep sweet longer than in those of other materials, and thus consequently afford a longer time for the cream to rise, and produce one sixth more butter, as has been proved, of the sweetest quality. The pans are very durable, and not likely to rust.

NOTICE.

The undersigned being owner of the Letters patent for the manufacture of the above article, hereby cautions the Public from trespassing on his patent right, as they would avoid the penalty of the law; and also gives notice that he has appointed J. R. Newell, proprietor of the Agricultural Warehouse in the city of Boston, his Agent for vending the above articles.

Aug. 3. CHARLES BISHOP.

Dale's Hybrid Turnip Seed.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A few packages of seed of this new variety of turnip, so highly esteemed in Scotland, and which is described in this week's N. E. Farmer.—Price 12½ cts. each paper. Aug. 3.

30 Dollars Reward.

The above reward will be paid by the Subscriber for the detection and conviction of the vile wretch or wretches who have been base enough to break down a large number of young red maple Trees, set out on the road adjoining his Farm, leading from Dedham turnpike to Brush-hill turnpike, for the purpose of shade and ornament. As the vile wretch who could be guilty of such a crime is dangerous to the community, it is hoped that the citizens of Roxbury and Dorchester will be vigilant in endeavoring to detect him, in order that he may be brought to public justice. JEREMIAH HILL.

Boston, July, 1831. July 20.

Bees.

The Subscriber has 300 swarms of Bees for sale, in his Patent Slide Beehives, at 20 cents per pound, weight of each swarm from 40 to 100 lbs. tare of hive deducted; the price of the Patent hives is \$2 a piece, and the price of a single right \$3.

Also for sale, 200 swarms of bees in the old fashioned hive, price 17 cents per pound, tare of hive deducted.

The above will be delivered within fifty miles of Boston, in good order, (warranted free from moths or otherwise damaged) by the first day of March, 1832.

All letters must be sent in before the first day of September, 1831, post paid, to the subscriber, at Brighton, Mass. so as to have time to transport them from Maine.

N. B. The weight of the above hives will be taken in September. EBENEZER BEARD.

July 6 ep2m

Amunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 63 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. J. Jan.

Black Currant Wine.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A further supply of superior old Black Currant Wine, made under the inspection of John Paine, Esq. Roxbury; an account of its anti-frigid and detergent properties in various complaints, will be found in the N. E. Farmer, vol. 5, page 267, written by S. W. Pomroy, Esq. and the late Doct. J. G. Coffin. It is highly salutary in many summer complaints. Doct. Coffin states: "It has been attended with remarkable success in the early stages of cholera morbus and dysentery—and again also in the later stages of these diseases, after the symptoms of inflammation or febrile excitement had ceased. It has been strikingly remedial in the low states of typhoid and bilious fever. The late Capt. Gilchrist, who for several years followed the Batavia trade, and who had always suffered an attack of the severe cholera which proves so destructive of human life in that climate, used to say that after he had this wine with him, and took two glasses of it every morning, he escaped the disease. On one voyage, his mate, who had not taken the wine, was seized with this complaint, when a bottle or two stopped its progress. We have not room to enumerate any other morbid affections in which this wine has proved useful. In sore throat it has for many years been considered almost a specific remedy.—Price 75 cts. per bottle. Aug. 3.

European Lecches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Lecch. All orders will receive prompt attention. EBENEZER WIGHT,

46, Milk street, opposite Federal-st. Apothecary. August 3. copit

Tulip Roots.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A splendid collection of Tulip Roots, now in fine order for transplanting, comprising some of the most beautiful varieties now cultivated in this vicinity, viz:

Marbled or mottled, dark stamens.
White and Purple, ditto.
Yellow and Purple, ditto.
Double Yellow Rose.
Double pale yellow flamed, (Passe non plus ultra.)
Crimson, yellow centre and yellow stamens.
White, shaded with red, dark centre and stamens.
Fine large yellow, with yellow stamens.
Double white, with red shades, (beautiful.)
Double orange brown, (very large.)
Double parony rose.
Double tulip color.
Parrot tulips, of several colors.
Fine bicolors, (striped on white ground.)
Fine bizzars, (striped on yellow ground.)
Fine Rosy, on white, &c. &c. Price 12½ cts. each—\$1 per doz.

The above are of large size, and are raised from superior imported roots, some of which cost \$1 each.

Also, common tulip roots, of all colors, and of good size, price \$5 per hundred, suitable for those commencing a large tulip bed.

Also, Double White and Yellow sweet scented Narcissus—12 cts. each—\$1 per doz. Aug. 3.

Seeds for Fall Sowing.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

Garden and Field Seeds, suitable for fall sowing, among which are—

WHITE PORTUGAL ONION.
PRICKLY SPINACH, (for early greens.)
BLACK SPANISH or WINTER RADISH.
LONG DUTCH PARSNIP, and a variety of other garden seeds.

Also—TIMOTHY or HERDS GRASS—ORCHARD GRASS—RED TOP, RED and WHITE CLOVER, &c. &c. Aug. 3.

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed. Aug. 3.

BRIGHTON MARKET—Monday, Aug. 8.

[Reported for the Chronicle and Patriot.]

At Market this day 417 Beef Cattle, including 40 unsold last week, 156 Stores, 42 Cows and Calves, 3309 Sheep and Lambs, and 75 Swine—the Swine the same we reported last week. About 39 Beef Cattle remain unsold.

Prices.—Beef Cattle—No particular variation from last week. We shall quote the same from \$1 to 5.25. Stores. We noticed only a few sales. The remainder have left the market and gone south.

Cows and Calves.—A large proportion were of an inferior quality. We noticed sales at \$12, 14, 15, 17, 20, 23 and 30.

Sheep—Sales will average about the same as last week. We noticed sales of one or two lots of ordinary quality at \$1.54. Also lots as follows, \$1.75, 1.83, 1.88, 1.72, 2, 2.12, 2.25 and 2.50—a few Wethers at \$2.50 a 3.

Swine—At retail 5c. for Sows and 6c. for Barrows.

New York Cattle Market, Aug. 1.—At market this day 7 to 800 Beef Cattle, 2000 to 2500 Sheep and Lambs, 100 Swine, and 25 Milch Cows. Market has varied very little from last week; if anything a small depression. Few extra Beef Cattle, at \$6.50, good 5.75 a 6.00 fair, 5.25 a 5.50, middling 4.50 to 5 per cwt. Sheep, extra, 4 a 4.50, (a very superior brought \$5) good 3.00 a 3.50, fair 2 a 2.50, and ordinary 1.50 a 1.75, each. Milch Cows \$18.25 a 30; Swine market good and prices from 4 a 4c.—Journal of Commerce.

[?] In the New York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

THE MOWER.

I'm a father of ploughmen, a son of the soil,
And my life never tires, for my pleasure is toil—
There are worse states to bear than the sweat on the brow,
And worse things to follow, my friend, than the plough.

What is sorrow? I think such a matter there is,
But to me it showed never its ill-looking pliz;
What is want? To be idle, to steal, and to lie,
And sickness? the Doctor can tell, but not I.

I suppose I must come to the scratch though at last,
For Time has a scythe that would cut down a mast,
Though now on the borders of three score and ten,
Your corners I cut, and can do it again.

If the best of you willing to try with me feels,
Let him strip to the cotton, and look to his heels—
Through the clever and triantly look at my swath,
Like the wake of a frigate,—stand out of my path.

Bos. Cour.

EPIGRAM.

From the Greek Anthology (Author unknown)

A Miser saw a little mouse
Running about his empty house;
And 'Mousey' says he, 'pretty dear,
Tell me what errand brings you here.'
Then squatting in a distant nook,
The mouse replied with merry look,
'Fear not, good sir! to waste your board,
I come to lodge, and not to board.'

ON A DANDY.

A Dandy is a chap that would
Be a young lady if he could;
But as he can't, does all he can,
To show the world he's not a man.

FOR THE NEW ENGLAND FARMER.

Who can behold the unbounded goodness of God, in the wonderful works of nature, impressed with a deeper sense of gratitude, than the Farmer? When he rises with the lark, and looks around his rural habitation, beholding his fields waving in magnificent splendor, and the bleating flocks of his pasture, has he not the strongest proof of an all-wise and beneficent Benefactor? Truly, the farmer cannot but feel a realizing sense of his entire dependence on the great Giver and Preserver of all, when he witnesses the many rich favors and blessings, which the Almighty hand is continually showering down upon him,—with what emotions of gratitude must he feel impressed, when he beholds all nature tuning her note to the praise of the great Author of all good. M. L. G.

A cure for the Ague and Fever, that has never failed in 500 cases. 1-2 oz. of cloves, 1-2 oz. cream tartar, 1 oz. of Peruvian bark, well pulverised. Put them into a bottle of the best port wine, and take the decoction or tincture on the well days, as fast as the stomach will receive it. As there are now more persons afflicted with the fever and ague than at any other period, in the opinion of the faculty, the publication of the above recipe will entitle you to the thanks of numbers who now labor under that disorder.—Washington County Adv.

A correspondent of a Provincial paper has favored the editor with the following splendid effusion in praise of his beloved, who had at her own disposal £200:

'The moon has got a bright round face,
And so hast thou, my love, too;
The stars shine brightly in their place,
And so dost thou, my dove, too;
Thy eyes shine splendidly within their sockets,
More splendid still the shiners in thy pockets.'

Temptation.—Dr Radcliffe, attending one of his most intimate friends in a dangerous illness, refused, with an unusual strain of generosity, to take a fee. The patient insisted; but the doctor was positive.—When the cure was performed, and the physician about to take his leave, 'Sir,' said his friend, 'in this purse I have put every day's fee: nor must your goodness get the better of my gratitude.' The doctor eyed the purse, counted the days in a moment, and then stretching forth his hand, said, 'Well, I can hold out no longer; single, I could have resisted them for a twelve-month; but altogether, they are irresistible.'—*Albion.*

Sir Stamford Raiffes' children had inbided from him those tastes it was his pleasure to cultivate; thus it will not be wondered at, even at their early age, that two young tigers and a bear were for some time in the children's apartments, under the charge of their attendant, without being confined in cages;—and it was rather a curious scene to see the children, the bear, the tigers, a blue mountain, and a favorite cat, all playing together—the parrot's beak being the only object of awe to the whole party.—*Ibid.*

Plurality of Wives.—A sailor, named William Burch, who was committed last week by the magistrates at the Thames Police Office for polygamy, he having three wives living, and being on the point of marrying the fourth—appears to have studied the following verse, from a popular sea-song, to some purpose:

'I have a wife at Portsmouth gates,
Another at Goree;
A Copper color at the Straits,
And a Black at St Lucie.'

Ibid.

Good Pilotage.—Nothing is more amusing than the alacrity of Irishmen in getting into scrapes, and the happy naïveté and blunders, with which they endeavor to extricate themselves.

A captain of a man of war, newly appointed to a ship on the Irish station, took the precaution, in 'beating out' of harbor, to apprise the pilot that he was totally unacquainted with the coast, and therefore he must rely entirely on the pilot's local knowledge for the safety of his ship.

'You are perfectly sure, pilot,' said the captain, 'you are well acquainted with the coast.'

'Do I know my own name, Sir?'

'Well, mind I warn you not to approach too near the shore.'

'Now make yourself easy, Sir; in troth you may go to bed if you please.'

'Then, shall we stand on?'

'Why, what else would we do?'

'Yes, but there may be hidden dangers which you know nothing about.'

'Dangers?—I like to see the dangers dar hide themselves from Mick.—Sure, don't I tell you I know every rock on the coast: (here the ship strikes) 'and that's one of 'em!'—*Ibid.*

An English lady being asked by a German on what account she drank the waters of the Spa, replied in French, '*Parceque je n'ai point d'esprit.*' She meant to say because she was out of spirits; but, by a mistake in her French, she said, 'because I have no understanding.' Doctor Johnson used to laugh heartily at this, and say it was the reason why most people frequented watering-places.

Frederic H. met the Bishop of Ermeland soon after he had despoiled him of a large part of his revenue, and after saying that he was his friend, notwithstanding what had happened, asked him if he retained sufficient good will to hide him under his bishop's mantle, in case St Peter should refuse to admit his royal person into Paradise. 'Sir,' replied the bishop, 'that will scarce be possible. Your majesty has cut my mantle too short to admit of carrying any contraband goods under it.'

Medical School in Boston.

The Medical Lectures of Harvard University delivered in Boston will be commenced in the Autumn, at the usual period, viz. on the third Wednesday in October. They will be continued four months.

This extension in the term of the Lectures has been thought necessary to afford time for such a course of instruction and demonstration, as is deemed by the Faculty to be requisite, under the advantages which have recently accrued to the School.

The Legislature of Massachusetts, with an enlightened liberality, which does honor to our age and country, have extended the protection of law to the cultivation of Anatomy within this Commonwealth. The advantages which will hence result to students resorting to this school will be sufficiently obvious. It will be the aim of the Professors to carry into effect the intentions of the Legislature, in such a manner as to evince at the same time their respect for the rights of humanity, and their interest in the promotion of the healing art.

The opportunities for practical instruction at the Massachusetts General Hospital continue undiminished.

The course of Lectures will be—

On Anatomy and Surgery, by Dr Warren.

Chemistry, by Dr Webster.

Materia Medica, by Dr Bigelow.

Obstetrics and Medical Jurisprudence, by Dr Channing.

Theory and Practice of Physic and on Clinical Medicine, by Dr Jackson.

WALTER CHANNING,
Dean of the Faculty of Medicine.
Boston, June 15, 1831. 60° July 16

Lynn Mineral Spring Hotel.

Ten miles from Boston, Six from Salem, and Five from Nahant. The subscriber most respectfully begs leave to inform his friends and the public that he continues to keep that delightful summer retreat, the Lynn Mineral Spring Hotel, which it will be his object to render good and pleasant resort for Boarders, Parties of Pleasure, transient Visitors, &c.

The salubrious qualities of the waters of this celebrated Spring—the beautiful lake, on the borders of which the establishment is situated, abounding with fish of various descriptions, and surrounded with the most wild and romantic scenery—splendid Boats for sailing or fishing—Bathing rooms on the margin of the lake, where the warm or cold bath may at any time be taken—the delightful situation of the House, with its comfortable and well furnished apartments, with the fruit and flower Gardens adjoining, are attractions for those in pursuit of health or pleasure, rarely excelled if equalled in any part of the country.

Every exertion shall be made to merit a continuance of that patronage which has been so liberally bestowed. JAMES W. BARTON.

Cocoons Wanted.

The Subscriber will pay cash for Cocoons, from 25 to 50 cents, according to quality. J. H. COBB.
Dedham, July 13th, 1831. 80° July 20.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer office. Aug. 3.

Published every Wednesday Evening, at 83 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

AGRICULTURE.

PREMIUM LIST OF THE MASSACHUSETTS SOCIETY FOR PROMOTING AGRICULTURE, FOR 1831.

OF BUTTER, CHEESE, VEGETABLE AND GRAIN CROPS,
THE BEST CULTIVATED FARMS, EXPERIMENTS,
DISCOVERIES, AND INVENTIONS, TREES,
AND LIVE HEDGES.

The Cattle Show, Exhibition of Manufactures, &c, held for the last fourteen years at Brighton, will be omitted the present year, for the purpose of giving greater encouragement, by increased Premiums to other objects, attention to which, at the present moment, appears to the Trustees of paramount importance. All the Premiums hereinafter specified will be awarded at the time and on the conditions, as particularly set forth below.

BUTTER AND CHEESE.

To the proprietors of the best lots of Butter and Cheese exhibited, without regard to the place of manufacture.

For the best lot, in tubs, pots, or firkins, not less than 300 lbs.	\$100 00
For the next best, not less than 300 lbs.	50 00
For the best, less than 300 lbs. and not less than 100 lbs.	30 00
For the next best, less than 300 lbs. and not less than 50 lbs.	20 00
For the best, less than 100 lbs. and not less than 50 lbs.	15 00
For the next best less than 100 lbs. and not less than 50 lbs.	10 00
For the best lot of Cheese, not less than one year old, and not less in quantity than 300 lbs.	100 00
For the next best, not less than one year old, and not less in quantity than 300 lbs.	50 00
For the best Cheese, less than one year old, and not less in quantity than 300 lbs.	50 00
For the next best, of not less quantity	30 00

VEGETABLE AND GRAIN CROPS.

For the greatest quantity of Carrots on an acre, not less than 600 bushels	\$20 00
For the greatest quantity of ditto on half an acre, not less than 300 bushels	10 00
For the greatest quantity of Potatoes on an acre, not less than 500 bushels	20 00
For the greatest quantity of ditto on half an acre, not less than 250 bushels	10 00
For the greatest quantity of common Beets on an acre, not less than 600 bushels	20 00
For the greatest quantity of ditto on half an acre, not less than 300 bushels	10 00
For the greatest quantity of <i>Mangel Wurzel</i> , or Scarcely Root, on an acre not less than 600 bushels,	20 00
For the greatest quantity of ditto on half an acre, not less than 300 bushels	10 00
For the greatest quantity Sugar Beets on an acre, not less than 600 bushels	20 00

For the greatest quantity of ditto on half an acre, not less than 300 bushels	10 00
For the greatest quantity of Parsnips on an acre, not less than 100 bushels	20 00
For the greatest quantity of ditto on half an acre, not less than 200 bushels	10 00
For the greatest quantity of Ruta Baga on an acre, not less than 600 bushels	20 00
For the greatest quantity of ditto on half an acre, not less than 300 bushels	10 00
For the greatest quantity of common Turnips on an acre, not less than 600 bushels	20 00
For the greatest quantity of ditto on half an acre, not less than 300 bushels	10 00
For the greatest quantity of Onions on an acre, not less than 600 bushels	20 00
For the greatest quantity of ditto on half an acre, not less than 300 bushels	10 00
For the greatest quantity of Cabbages on an acre, not less than 25 tons weight, free from earth when weighed	20 00
For the greatest quantity of ditto on half an acre, not less than 13 tons	10 00
For the greatest quantity of Vegetables (Grain, Peas, Beans, excepted) for home consumption and not for sale—raised for the keeping of stock, regard being had to the size of the farm in proportion to the crop, and to the number of the stock kept,—and also to the respective value of the vegetables as food, and the expense of raising the same	30 00
For the greatest quantity of Indian Corn on an acre, not less than 100 bushels	20 00
For the greatest quantity of Winter Wheat on an acre, not less than 30 bushels	20 00
For the greatest quantity of Barley on an acre, not less than 45 bushels	20 00
For the greatest quantity of Rye on an acre, not less than 30 bushels	20 00
For the greatest quantity of Millet on an acre, cut and cured for hay, not less than 3 tons; the claimant giving evidence of the time of sowing, the quantity of seed sown, and the quantity of hay produced	20 00
For the greatest quantity of dry Peas on an acre, not less than 30 bushels	20 00
For the greatest quantity of dry Beans on an acre, not less than 30 bushels	20 00
For the greatest quantity of Mustard Seed, not less than 20 bushels	20 00
For the greatest quantity of dressed Flax, not less than 500 lbs. from an acre	20 00
For the greatest quantity and best quality of Hemp, on an acre	40 00

It is to be understood that the quantity of land specified above is, in each case, to be in one piece. And the claimant of any of the above premiums shall, with one other person, make oath to the following particulars before some Justice of the Peace, and with a certificate of the same, shall obtain a certificate of the

measurement of the land by some sworn surveyor.

The particulars are—

1. The condition of the land in the spring of 1831.
2. The product, and general state of cultivation and quality of manure used upon it the preceding year.
3. The quantity of manure the present season.
4. The quantity of seed used, and if potatoes, the sort.
5. The time and manner of sowing, weeding, and harvesting the crop, and the amount of the product ascertained by actual measurement, after the whole produce for which a premium is claimed, is harvested, and the entire expense of cultivation.
6. Of Indian corn—the entire crop of the acre offered for premium, if shelled, to be measured between the 15th of November, and the 1st of December. If not shelled, the whole to be weighed within the same dates, and 75 pounds of corn and cob, is to be considered as equivalent to one bushel of shelled corn.
7. At least 40 bushels of the vegetables, for which a premium is claimed (except potatoes, onions, and common turnips,) are to be weighed, and 50 pounds, from the dirt, will be considered as a bushel.

THE BEST CULTIVATED FARMS.

For the best cultivated Farm	\$100 00
For the next best cultivated Farm	75 00

The farm to consist of not less than 70 acres, exclusive of woodland. The owner or tenant, to entitle himself to either of the premiums, must state in writing the nature and quality of the soil; the proportions suitable for tillage, mowing and pasturing, respectively, and especially the quantity of irrigated meadow or low land which is never tilled or ploughed.

The number of acres planted the present year with corn, potatoes, and other vegetables.

The number sowed with winter and spring grains, and other vegetables, specifying the several kinds, and the number of acres planted or sown with each.

The quantity and kind of manure used for each crop, and the times and manner of applying it.

The quantity and quality of each crop.

The number of acres mowed the present year, specifying the proportion of irrigated meadow, or low land, and the proportion which had been ploughed or tilled, and the kind of grass, and quantity of hay on each.

Manner of irrigating the lands, and dressing and manuring meadow or low land, and irrigated upland, if any, and laying down tilled land to grass.

The kinds of grass seed sown, the quantity of each, the time of year, and whether sown with oats, barley, or other grain, or alone.

The number of acres of pasture; the part, if any, that had previously been ploughed; when this part was laid down, and the kinds and quantities of grass seed sown per acre.

The number of apple trees on the farm; the proportion grafted; whether planted in orchards or partly by the fences against the road; the quantity of winter apples gathered and cider made; treatment of trees, and manner of making cider.

The form and dimensions of barns, sheds and barnyard, and manner of collecting and making manure.

The number of oxen, cows, and young stock, horses and sheep, kept on the farm through the year, and the quantity of butter and cheese made, distinguishing the new milk from the other cheese, and the breed of cows, whether foreign, mixed, or native.

The number of swine and quantity of pork made.

The labor employed in carrying on the farm, and quantity of ardent spirits consumed.

As it is deemed important to ascertain the best rotation of crops, it is expected that the applicants for these premiums will state the kind of crop, if not able to state the quantity, raised on the several and respective pieces of tillage, mowing, and pasture land described in their statements, for two years next preceding the present one.

The manner of feeding his stock in the winter season; whether he gives his milch cows or oxen grain or roots of any kind, and the kind and quantity.

His treatment of calves he intends to raise; whether he lets them continue to suck, or weans them soon after born—how soon—what food he gives them, and how long he continues to feed them.

His manner of making cider and cleansing his old barrels, and the time he draws it off, if at all.

The kind of food given to his swine, and the manner in which it is prepared.

The age at which he finds it most profitable to make beef of his working oxen and good milch cows.

If it be a sheep farm, the manner he treats his sheep in the winter; whether they are housed or left out in the yard, the food given them, and the time they generally lamb.

The whole statement to be sworn to by the applicant. The Trustees to be at liberty, in all cases, before they award the premium, to visit by a committee, or such other persons as they shall appoint, the farms of the applicants, if they deem it expedient.

N. B. Claims to be addressed to Benjamin Guild, Esq. in Boston, (post paid) before the first day of October next.

EXPERIMENTS, DISCOVERIES, AND INVENTIONS.

For the experiment of turning in Green Crops as a manure, on a tract, not less than one acre, and proving its utility, giving a particular account in writing under oath of the process and the result \$20 00

For the most successful use of the Drill Plough, in the cultivation of any small grains or seeds, on a scale of not less than one acre 20 00

For an effectual and satisfactory mode of destroying the Bee-moth or of preventing its ravages 20 00

For an effectual and satisfactory mode

of extirpating the worm that attacks the Locust tree

For a new, effectual, and satisfactory mode of extirpating the Borer which attacks the apple tree 50 00

For any newly invented Agricultural Implement, or Machine, superior to any designed for the same use, that shall have heretofore gained a premium, a reward not exceeding twenty dollars, according to the importance of the invention 20 00

TREES AND LIVE HEDGES.

For the largest plantation of the White Mulberry tree, not less than two thousand plants, nor less than three years old, to be claimed on or before the 1st of December, 1832 850 00

For the greatest quantity of raw or unmanufactured Silk, not less than ten pounds, raised by the claimant, and presented before the 1st December, 1832 20 00

For the best plantation of White Oak trees, not less than one acre, nor fewer than 1000 trees per acre—raised from the acorn—not less than three years old, and which shall be in the most thriving state on the 1st September, 1832 100 00

For the best plantation of White Ash, Larch, or Yellow Locust trees, each of not less than one acre, nor fewer than 1000 trees per acre, to be raised from the seeds, and which trees not less than three years old, shall be in the most flourishing state on the 1st September, 1832 50 30

For the best Live Hedge, made either of white or Cockspur Thorn, planted after 1820, not less than one hundred rods, and which shall be in the most thriving state in 1831 50 00

For the best Buckthorn Hedge, not less than 100 rods, and which shall be in the most thriving state, in 1831 50 00

For the best Apple Orchard planted since 1822, not less than 100 trees, and which has been managed, in all respects, with care and skill, and shall be in the most thriving condition in the season of 1831 50 00

Claims for the premiums on vegetable and grain crops, and experiments and inventions, together with the evidences required, are to be in writing, and sent free of expense, to BENJAMIN GUILD, Esq., in Boston, Assistant Recording Secretary, on or before the first day of December next, and they will be examined by the committee, previous to the 7th day of December, on which day the premiums will be announced at Quincy Hall.

Competitors for the Butter and Cheese premiums will please to take notice, that there will be a public auction after the examination by the committee. There will be no charge for auctioneer's fees, but the government duty must be paid by the owners of the butter and cheese. The committee will be at liberty to withhold from the auction sale, any parcels, either of butter or cheese, which they may have reason to suppose, from the ordinary quality of the

same, or other circumstances, may have been sent to the hall, *merely for sale*.

Claims for the premiums on Butter and Cheese, must be made in writing, addressed to Benjamin Guild, Esq., Boston, post paid, on or before the first day of December, 1831. And the parcels deposited before Tuesday the 6th, at Quincy Hall, on which day, at 10 o'clock, A. M. the committee will examine the lots offered for premium, and none will be admitted after that hour.

The premiums will be awarded at the Hall on Wednesday the 7th.

Each lot must be marked with the initials of the owner's name, and the place of manufacture.

It is particularly recommended to the competitors, that the butter be put up in the nicest manner.

Agricultural Implements of new invention, intended for exhibition, must be sent to the Hall on or before Tuesday the 6th December.

FOR THE NEW ENGLAND FARMER

STOCKS FOR FRUIT TREES, &c.

MR FESSENDEN—Although your valuable paper has treated very extensively (and in my opinion very properly) upon the subject of raising Fruit Trees, yet I have examined its files, and likewise several respectable writers on Horticulture almost in vain, for practical information on the subject of raising the stocks proper for the different species and varieties of fruits. The reason of this scarcity of information probably arises in a great degree from the fact, that most persons procure their fruit trees already grafted or budded from the nurseries, and that the nursery men commonly acquire their knowledge from experienced living cultivators. As however, there are considerable inconveniences attending the procuring of trees from distant nurseries, and a difficulty of getting vigorous and healthy trees, to say nothing of the expense of purchasing a considerable number, which one must do at the present time to be certain of obtaining the best kinds, I think many persons would prefer, (if they could without difficulty obtain the requisite information) to raise a part, at least, of their fruit trees from the seed and attend personally to the grafting or budding them. I do not suppose it is advisable for the great body of the community to do this, for I think that the proprietors of the large nurseries are doing a very important service to the country, and deserve, and will continue to receive the patronage of the public. The Princes, Landreths, Kenricks, Winships, Buel and others, are entitled to much credit for their exertions in introducing and cultivating new species and varieties of fruits and other vegetables, and we doubtless owe to those exertions in common with the Horticultural Societies the introduction of many new kinds, some of which may be justly estimated of national advantage. The Messrs Prince especially have spared no pains or expense in the collection of the choicest and most unbounded variety of the gifts of Flora and Pomona. But to return to the subject of this communication. I should be much gratified, and believe it would

be doing an essential service to a portion of the fruit loving community, if some one well acquainted with the subject, would communicate through the columns of the Farmer, information concerning the sorts of stocks best adapted for each kind of fruit, and likewise a minute detail of the best mode, and time of gathering, preserving and sowing the different kinds of seed for the stocks, especially of Cherries, Pears, Plums, Apricots, &c. Apple stocks are raised without difficulty, but Pears, Cherries, Plums, &c. are, according to my limited experience, somewhat difficult of growth. Peach stocks are also raised without difficulty, but I believe it is thought by most nursery men, that Peach stocks are of very limited value. I will however remark, that I think I have seen an observation of Mr T. A. Knight, that fruit trees are generally the most durable when grafted or budded on stocks of the same species. If such an opinion was entertained by that distinguished horticulturist, it is certainly worthy of examination. As the time for gathering the seeds and stones of most fruits is approaching I hope shortly to hear from some one on the subject.

I will likewise call the attention of some of your correspondents to an insect of a new kind to me that appeared on the grape vines in this neighborhood in the spring. It appeared just as the vines were putting forth their buds, and cut into the centre of the bud. In many cases it was apparently the cause of the entire failure of the fruit, and a serious injury to the vines, as, when the vines grew, instead of a single healthy shoot, several feeble ones started out, from one bud. The insect is a small bug, about the size of the small yellow bug that infests cucumbers, of a palish blue color. If any means were suggested for preventing the depredations of these insects, it would be gratifying to me, and perhaps to others.

Berlin, Ct., August 8, 1831.

FOR THE NEW ENGLAND FARMER.

MR FESSENDEN—As Tomatoes, have, at last, become common in our market, I send you a recipe for preserving them during the winter.

Besides the numerous modes of preparing this delicious vegetable for the table, it may be stewed, after being peeled, with sugar, like cranberries, and gooseberries, producing a tart equal to either of those fruits. Try the experiment and be satisfied. Your most obedient servant.

H. A. S. DEARBORN.

Brinley Place,
Aug. 14, 1830.

EXTRACT NO. XXXIV.

From the Annales de la Societe d'Horticulture de Paris.

METHOD OF PRESERVING TOMATOS.

'The boiling required for the preservation of fruits, always changes their quality, and sometimes entirely alters their character; and it often happens, when the fruits are acid, as in the Tomato, that they imbibe in the copper vessels, in which they are stewed to a certain consistence, metallic principles, which are injurious to health. This double consideration induces us to publish an excellent method for preserving the tomato, which does not alter the quality of this fruit, and does not require the action of heat.

'A sufficient quantity of salt is dissolved in spring or river water to make it strong enough to bear an egg; select perfectly ripe tomatos, and place them well and without pressing them in a stone or glazed earthen pot, which is to be filled with

the brine; cover the pot with a deep plate in such a manner that it presses upon the fruit, and by this simple process tomatos may be preserved more than a year without attention. Before cooking them they should be soaked in fresh water, for several hours.'

BUDDING—QUERY.

MR FESSENDEN—This is the season for budding fruit trees; those who practise the art are naturally led to reflect more on the subject generally at this than at other seasons.

We are told by nurserymen, and others skilled in Botany, that trees of the same genus may be budded indiscriminately into each other; the bud producing leaves of its kind will control the future growth of the tree.

The reason assigned is that the leaf receives the sap, and by its peculiar construction prepares and modifies it in a suitable manner to produce wood, bark, and fruit of its kind.

Suppose I have a seedling plum tree of the size of a goose-quill: I insert a bud of the peach—remove the top—the buds grow—and in a few years, in consequence of the power and influence of the leaf I have a large peach tree—Now if the above theory be correct, the whole tree, root and branch (except the small portion that existed at the time of budding) ought to be peach and produce peach suckers—and yet it is confidently asserted that this will not be the case, and that the growth below the point where the bud was inserted will continue to be plum, the above theory to the contrary notwithstanding.

If you think the above worthy of notice, and if you or any of your correspondents will have the goodness to explain the matter you will oblige at least one of your constant readers.

Newton, Aug. 15.

Horticulture.

Proceedings of the Massachusetts Horticultural Society at a meeting, held at the Hall of the Institution, on Saturday the 13th of Aug. 1831.

The President read the following letter:

Baltimore, August 6, 1831.

DEAR SIR—I have the pleasure of inclosing to you, for the Massachusetts Horticultural Society, a few seeds of the nut-bearing pine tree. A more particular description of which will be found in the last number of the American Farmer.

Yours respectfully, JOHN S. SKINNER,

Hon. H. A. S. DEARBORN, Pres. Mass. Hort. Soc.

The seeds were distributed.

The President stated that he planted the seeds of this species of Pine, (*Pinus Pinen*, or *Stone Pine*) last spring, and has some fifty plants, which he shall be happy to present in the autumn to the members of the Society. The tree is described in *Michaux's North American Sylva*. It is a native of the northern coast of the Mediterranean, and the seeds are eaten as a substitute for almonds. The cones are very large, and give an interesting appearance to the tree.

Horticultural Hall,
Saturday, August 13, 1831.

FRUITS EXHIBITED.

By the President, specimens of native Pears, from a tree which was produced from the seed planted about twelve years since, in his garden, Brinley Place, and now just coming into bearing; pears rather under medium size, and of good flavor.

From Z. Cook, Jr. Esq., well flavored Bergamot

Pears, of medium size, from a tree imported from France 6 years since, name lost.

From Mr Manning, Pears—Skinless, Summer Frankral, of the Pomological Magazine, a specimen of pears variously but erroneously called at Flushing *Julienne*, *Joural*. Also, the true *Julienne*, of Cox, but not of Flushing, a fruit of medium size, but superior flavor. This last fruit if we mistake not is the same sometimes here mis-called *Summer Boyenne*—*Summer St. Michel*.

From S. G. Perkins, Esq., Pears.

From Mr E. M. Richards, Pears—Skinless, Early Catharine, and English—Catharine, otherwise called English Red Cheek.

From Mr Stearns, of Salem, very fine Jargonelle Pears. [*Cuisse Madame de France*.]

From Mr Pettee, of Newton, handsome specimens of ripe Peaches.

From Dr Robbins, of Roxbury, handsome Sopsavine Apples, and a late fall apple, of good size, and very delicate appearance, name unknown; and another specimen (name lost) of a fine juicy apple, small in size, and deeply stained outside and inside with dark crimson; ripe 20th July, and continues nearly till October.

From Mr S. Pond, of Cambridge Port, for premium, Gage Plums, large and fair.

From Mr Ebenezer Breed, very large Lemons, raised in Charlestown, on trees imported from Malta.

From Messrs Adams & Seaver, of the Faneuil Hall Market, three large and beautiful bunches of ripe Black Hamburg Grapes.

WILLIAM KENRICK.

Pears.—As this delicious fruit is beginning to ripen, and as some varieties are of short duration on account of their rotting at the core, we would recommend to those who have pears, which are subject to this sudden decay, to pick them from the tree before they become mellow, and place them in a cool, dry place, as in a chamber, where by spreading them, they can be examined more particularly than when on the tree, and those properly matured, selected for use before they become rotten at the core, which they will not do, as soon as when ripened on the tree.—*Genesee Farmer*.

Strawberries.—We would remind those who wish to cultivate this fine fruit in their gardens, that the beds in which they intend to set them should be well manured, and dug at least one month before planting out the vines, which should be done early in September, in order that they may take sufficient root to prevent their being thrown out by the frost during the winter or spring. A situation that is rather moist than otherwise, is preferable, and one that is half shaded is better than one exposed to the full blaze of a meridian sun. Give the ground deep and repeated spadings, previous to setting the young plants, which should be at a distance of from twelve to eighteen inches apart.—*ib.*

Silk Worms.—It is stated when the leaves of the Mulberry tree have been nipped by frost, or when the worms are hatched before the leaves put forth, they may be fed upon the dried leaves of the Mulberry, gathered before the frost commences in Autumn. The leaves must be dried in the sun, by spreading them on large cloths; after which they must be reduced to powder. When it is necessary to feed the worms, moisten the powder with water very gently, and put a thin coat of it round the young worms, which they immediately begin to feed upon. This is likely to prove useful to those who are engaged in cultivating the Silk Worm, in our state.—*N. Y. Farmer*.

NOTES AND REFLECTIONS

Made during a Tour through part of France and Germany, in the autumn of the year 1828. By J. C. Loudon.

The Market Gardens of Paris (les Jardins Marais) are numerous, generally of small extent, and cultivated by manual labor; but a few of them may be designated Farm Gardens, in which are used the plough and other agricultural implements. As vegetables enter more into the cookery of France than they do into that of England, an immense quantity is consumed at the hospitals and similar institutions; and, in consequence of this, the more extensive market-gardeners employ their produce chiefly in executing contracts entered into with public bodies. With this exception, the produce of the Paris market-gardens is sold in the vegetable markets, as in London. There are several of these, but none so decidedly superior to all the others as to be compared to Covent Garden Market. The *Marché des Innocens* appeared to us one of the largest. We visited it twice, on September 13th, and December 20, and shall note what we saw in it on those days, with the conclusions which we drew.

La Marché des Innocens.—Sept. 13. The area exceeds an acre, and is surrounded by a quadrangular range of sheds, open on both sides, with a walk in the centre. In the inclosed area, potatoes and other roots are sold, as in the area of Covent Garden Market. We shall compare the supplies of the two markets about the same season of the year.

The Cabbage Tribe.—An abundant supply, but the variety not great, and the kinds coarse and not well headed. Very large Savoy, some red cabbages and field-cabbages, and also some broccoli and cauliflower. On the whole, the markets of London, Edinburgh, and Strassburgh, which we have seen at the same season (Edinburgh in 1803, and Strassburgh in 1819), were rather better supplied than the *Marché des Innocens*. The deficiency appeared to be in the quality of the kinds of cabbage and broccoli.

Legumes.—Ripe pods of kidney beans, but none green, and no common peas in pods. Decidedly inferior to British markets.

Tubers and Roots.—Abundance of potatoes, but the sorts not such as would be considered good in Britain.—Quantities of Jerusalem artichoke, scorzonera, black radishes, Teltow turnip, solid celery, carrots, parsnips, salsify roots, and others. The variety much greater than in Britain, and the quality of every article, except the potatoes and carrots, equal, if not superior.

The Onion Tribe.—An abundant supply of both onions and leeks, and also a quantity of shallots and garlic. The leeks smaller than in Britain.

Asparagus, Beans, Salads, &c.—A few artichokes, and some half-blanchéd celery, lettuce, endive, lamb's lettuce, and other salads. The variety greater than in Britain, the supply more abundant, and the quality superior.

Pot and Sweet Herbs.—Abundance of parsley of a coarse sort, tarragon and all our other aromatic herbs, capsaicum in quantities, tomatoes, and egg-fruit. The variety and supply both greater than in Britain.

Fungi.—Abundance of mushrooms, and some truffles. **Fruits for Tarts and Pickling.**—Large quantities of white cucumbers (concombres), of pickling cucumbers (cornichons), gourds, and pumpkins, in great variety, of all sizes, but we did not observe the vegetable marrow. On a par with British markets.

Fruits.—Abundance of apples, chiefly Colville; and of pears, chiefly bon christens and bergamots; rock and Cantaloup melons, Chasselas grapes, peaches, figs, and plums; pear-shaped sorbs, sold at about a sous each; and a great quantity of very excellent alpine strawberries. The last article is the only one in which this market excelled that of Covent Garden; in all the other fruits it was much inferior.

Adjoining the market are shops, in which are sold pistachios and other dried fruits, oranges, nuts, &c, carrots, dried pears, plums, apples, and apricots. The onions and carrots are charred

so as to become as black as ink: this effect is produced by baking them slowly in an oven, and taking them out at intervals during several days. They are used in cookery for coloring soups.

Sprigs of orange tree in blossom are, we were told, to be found in this market throughout the year. These are considered essential accompaniments to the dress of bridal parties; and although artificial flowers, perfumed with orange-water are sometimes employed by those who cannot afford the living article, yet the latter is by far the most generally used.

On the whole, the supplies of the Paris vegetable markets are inferior in point of excellence to those of London. The quality and variety of fruits are greatly inferior, and also the dryness and flavor of potatoes, and the succulency of turnips, cabbages, and the other common culinary vegetables; but the Paris markets approach to equality with those of London, in mushrooms, salads, and aromatic herbs, during summer, and surpass us in those articles during winter.

December 20. Observed a great quantity of excellent cauliflowers; endive and chicory, blanched in different degrees; lamb's lettuce, scorzonera, Teltow turnips, solid celery, common white turnips, very long leeks; onions, rather small; excellent field cabbage, in immense quantities; savoys, large heaps of mushrooms, and, to the best of our judgment at the time, every vegetable seen in the London markets about the same season, with the exception of broccoli, sea-kale, asparagus, and forced rhubarb. The fruits were Chasselas grapes, Colville and reinette grise apples, a few indifferent pears, different kinds of service, cornel berries, walnuts and filberts, and sprigs of orange-blossoms, as in September. It is but fair to mention that we failed in being at the market sufficiently early in the morning to see things in their best state. We shall now glance at some of the market gardeners.

The Field Market-Garden of M. Cadet de Mars, at Aubervilliers.—Oct. 4. Aubervilliers is a small village, about a league from Paris, and M. Cadet de Mars' grounds occupy 50 or 60 acres round it. This gardener has been repeatedly mayor of his village, and he is unquestionably at the head of field-market-gardeners in the neighborhood of Paris. He was, as he told us, a peasant; but it is impossible to see his imposing manly figure and open generous countenance without feeling that he is noble by nature. He is upwards of seventy; and he began the world without a penny, and without education; but he is now proprietor of the grounds which he cultivates, besides houses and other property. He has lately ceded his grounds, with the exception of a few acres for his own amusement, to his children; and lives quietly with his wife, an excellent woman, about twenty years younger than himself. This old man is full of gaiety and spirits, content with his past life, and apparently happy. He has always had the greatest curiosity respecting other countries, and this still breaks out every time he sees a foreigner. He told us that he would travel through England, provided his wife would accompany him. He once went as far as Havre with a friend who was going to England, for the sake of seeing the sea, and he speaks with raptures of the visit. He takes an interest in all that is passing in the world, and spoke much of America; the government of which he admires beyond that of all other countries, and which he hopes that France will one day adopt as

a model. He spoke much of the first revolution, of which he had witnessed many of the most interesting scenes. In politics and morals, indeed, he is far beyond his contemporaries; and is, in short, as far as an unlettered man can be, all that Jefferson or Lafayette could wish him to be. He made his fortune chiefly by taking large contracts to supply the hospitals. The largest contracts he ever had were made with the Hospice Salpêtrière; for which on gourd-day, i. e. the day on which the vegetable used in the soup served to the inmates is the pumpkin or the gourd, he used to supply 6000 lbs. He has had a fruit of the mammoth gourd which weighed 195 lbs. He had also large contracts with the manufacturers of sugar from the beet root; especially during the years 1812 and 1813, when the price of sugar in Paris was 5f. per lb. These companies failed, for the most part, in 1814 and 1815, when sugar fell to 11 sous per lb. His sons still cultivate large quantities of mangold-wurtzel for feeding cows; and it deserves to be remarked, that these cultivators, and also others in their neighborhood, who formerly used to gather a part of the leaves to sell as fodder while the plants were growing, have now left off the practice, from finding that it lessens the size of the roots.

In the field-garden culture practised here, and in other field-gardens in the neighborhood of Paris, the soil is ploughed for the crop with a two-wheeled plough; but all the operations of cleaning and gathering the crop are performed by manual labor. Irrigation, either by manual labor or by channels on the surface, is seldom resorted to. There is no regular rotation of crops; but in general, after three or four crops of vegetables, a crop of wheat is taken, or the land is sown with lucerne, under which it remains from two to five years. Turnips are seldom sown in the spring because the drought and insects destroy them; but in August, after the crop of peas, wheat, or rye is removed, they are sown with success. Onions and leeks are sown together in February; neither grows large. The onions are removed early in September, and the leeks remain to be taken up as wanted. Small leeks are preferred in the Paris market, as having more flavor; and the same as to onions and asparagus. Where the soil is deep, soft, and inclined to moisture, the marsh-mallow is cultivated for the apothecaries, and found to pay well, because suitable ground for this plant is rare on secondary lime-stone. Asparagus is grown in single rows along the bottom of shallow trenches, and, instead of covering the plants during winter as we do in England, their crowns or buds are hid almost bare, so as to receive the first influence of the sun in spring. As the plants begin to push, they are earthed up. A part of the grounds is planted with vines, in rows about 3 ft. apart, between each row of which is a row of asparagus; and in the rows of vines are asparagus plants, which alternate with the vines. When the vines are in fruit, the stalks of the asparagus are tied together in bundles, to admit more air to the vines. On expressing our surprise at the practice of laying bare the buds of asparagus during the winter, M. Cadet de Mars acknowledged that highly succulent varieties of asparagus, grown in deep richly manured soil, such as might be seen in some private gardens, and particularly in that of the king at Versailles, would suffer from this practice; but that field-asparagus, such as that before us, was nearer a state of nature, and suffered no

injury. He observed that a covering of earth or litter, while it prevented the escape of heat, at the same time prevented its entrance; and he gave, as an instance in favor of the practice, the well known early flowering of bulbs planted on the surface, as done with crocuses about Paris, in comparison with those which are inserted some inches deep in the soil. He is of opinion that cold serves to force forward plants as well as heat; having remarked that, after a very severe winter, provided it were short, bulbs flowered earlier, and asparagus was ready to cut sooner. Of course, this doctrine can only apply to very hardy plants, but, relatively to them, it appears to be one well deserving the consideration of British gardeners.

In the grounds which M. Cadet de Mars has retained for his own amusement, there is a wall covered with peach and apricot trees, very well trained in the fan manner. Along its top there is a projecting trellis, supported, at an angle of about 60°, by struts abutting against the wall, about 2 ft. lower than the top; and this trellis is covered with vines. The upper parts of the peach and apricot trees were evidently injured a little by the shade of the vines; but we were told that the latter were of some use to the former in spring, by protecting their blossoms from perpendicular cold. The trellis was loaded with grapes, which, from the path in front, had a very rich appearance. There were a great many dwarf apple trees in this garden, trained *en gobelet*: the sort preferred was the *reineette* de Canada. Brind M. Cadet de Mars' house is a small walled garden, formerly, if we are not mistaken, the burying-ground of a religious establishment, the church of which is now one of M. Cadet de Mars' barns, and is filled with apples and onions. There are some very large standard apricot trees in this garden, and a very old vine, which bear abundantly; and we saw a stack of onions as large as a haystack. The onions are stacked by alternating them with thin layers of rye straw; the straw at the outside of the stack being doubled in over the onions, so that none of them appeared to view. We have seen carrots stacked in the same manner with wheat straw in England.

INSECTS.

We copy the following interesting account from the last No. of the valuable Library of Entertaining Knowledge:

We do not wish to create, so much as to allay, the fears entertained by those who are unacquainted with the habits of insects; and nothing we are persuaded will do this more effectually than a statement of facts well ascertained. 'Several people,' says the Abbé de la Pluche, 'never eat fruit because they believe that spiders and other insects scatter their eggs upon it at random;' but even if this were so, as it is not, it would be impossible for the young, should they be hatched in the stomach, to live there for an instant. The possible cases in which this may occur we shall now briefly notice; they are fortunately very rare.

The meal worm, and some of the grubs which feed on grain and other provisions, are recorded to have been swallowed, and to have given rise to disorders in the stomach and bowels; but in all such cases it is plain, that if the insects did survive the increased temperature of the stomach, they could only live on the food swallowed from time to time, for, not being carnivorous, they would not attack the stomach itself. The same remark will apply no less forcibly to the herbivorous larvae, which might chance to be swallowed in salad, &c. The caterpillar of the tabby moth (*Aglossa pinguis*, LATREILLE,) which feeds on butter, the leather on

book-boards, &c. is said, on the authority of Linnaeus, to get sometimes into the stomach, and to produce considerable disorder; but this insect is very common in houses, and, from the rarity of such accidents, we are led to doubt the evidence usually brought forward.

That insects are, in some rare cases, introduced into the human stomach, has been more than once proved; though the greater number of the accounts of such facts in medical books are too inaccurate to be trusted. But one extraordinary case has been completely authenticated, both by medical men and competent naturalists; and is published in the Dublin Transactions, by Dr Pickells of Cork. Mary Riordan, aged 28, had been much affected by the death of her mother, and at one of her many visits to the grave seems to have partially lost her senses, having been found lying there on the morning of a winter's day, and having been exposed to heavy rain during the night. When she was about fifteen, two popular Catholic priests had died, and she was told by some old women that if she would drink daily, for a certain time, a quantity of water, mixed with clay taken from their graves, she would be for ever secure from disease and sin. Following this absurd and disgusting prescription, she took from time to time large quantities of the draught; some time afterwards, being affected with a burning pain in the stomach (*Cardialgia*), she began to eat large pieces of chalk, which she sometimes also mixed with water and drank.

Now, whether in any or in all of these draughts she swallowed the eggs of insects, cannot be affirmed; but for several years she continued to throw up incredible numbers of grubs and maggots, chiefly of the churchyard beetle (*Blaps mortisaga*, FABR.). 'Of the larvæ of the beetle,' says Dr Pickells, 'I am sure I considerably underrate, when I say that not less than 700 have been thrown up from the stomach at different times since the commencement of my attendance. A great proportion were destroyed by herself to avoid publicity; many, too, escaped immediately by running into holes in the floor. Upwards of ninety were submitted to Dr Thomson's examination; nearly all of which, including two of the specimens of the meal worm (*Tenebrio molitor*), I saw myself, thrown up at different times. The average size was about an inch and a half in length, and four lines and a half in girth. The larvæ of the dipterous insect, though voided only about seven or eight times, according to her account, came up almost literally in myriads. They were alive and moving.' Altogether, Dr Pickells saw nearly 2000 grubs of the beetle, and there were many which he did not see. Mr Clear, an intelligent entomologist of Cork, kept some of them alive for more than twelve months. Mr S. Cooper cannot understand whence the continued supply of the grubs was provided, seeing that larvæ do not propagate, and that only one pupa and one perfect insect were voided; but the simple fact that most beetles live several years in the state of larvæ sufficiently accounts for this.—Their existing and thriving in the stomach, too, will appear less wonderful from the fact that it is exceedingly difficult to kill this insect; for Mr Henry Baker repeatedly plunged one into spirit of wine, so fatal to most insects, but it revived, even after being immersed a whole night, and afterwards lived 3 years. That there was no deception on the part of the woman, is proved by the fact that she was always anxious to conceal the circumstance; and that it was only by accident that the medical gentlemen, Drs Pickells, Herriek and Thomson, discovered it.—Moreover, it does not appear that, though poor, she ever took advantage of it to extort money. It is interesting to learn that by means of turpentine, in large doses, she was at length cured.

White-washing.—One of the cheapest and best modes of preparing the white-wash, is to use skim milk with new slacked lime. This renders it adhesive, and it does not fall off as quick as when the lime is wet with water.

SOLID STEM WHEAT.—We had an opportunity a few days since, says the Annapolis, Maryland, Republican, of July 9, of seeing a lot of wheat upon the farm of Dr Wilson Waters, of Rhode River, from which we presume, something upwards of a bushel will be reaped—that if we mistake not, will be a valuable acquisition: it is the third product of a few grains of seed brought home by our fellow citizen J. A. Mayo, of the United States Navy, and obtained by him upon the *Plains of Troy*, in Asia Minor, which he spent some time in visiting a few years ago, when the ship on board which he then served, was in the Archipelago. The grains of this wheat are somewhat larger than those of wheat common to this country, though perhaps not quite as large as the wheat from the mountains of Chili. The stalk is peculiar for being nearly solid, instead of hollow, more tapering than other wheat, the first joints being larger, and forming a more substantial base. The head has a thick stiff beard, not less than six inches in length. It averages about forty grains to each head, which we ascertained to weigh one third more than the same number of grains of the blue stem wheat growing along side of it, and which also averaged forty grains to the head. Forty grains of the former weighed thirty grains—the same number of the latter weighed but nineteen grains. This being the third year that this wheat has vegetated in our climate and upon our soil, although but in specimen, we may fairly assure that it has been tested and found to answer well. It is said to be valuable more especially from the protection which the solidity of its stalk affords from the depredations of the fly, so destructive to other descriptions of wheat. It will also be much less liable to fall, we presume, from the same reason.

Rye.—According to some, rye is a native of Crete; but it is very doubtful if it be found wild in any country. It has been cultivated from time immemorial, and is considered as coming nearer in its properties to wheat than any other grain. It is more common than wheat on most parts of the continent; being a more certain crop, and one which requires less culture and manure. It is the bread corn of Germany and Russia.

In Britain it is now very little grown; being no longer a bread corn, and therefore of less value to the farmer than barley, oats, or peas.—*Encyc. of Agric.*

The big Beet beat.—The Tuscaloosa Intelligencer says, Mr F. M. Hickenburg has left at our office a Beet which grew in his garden, measuring *twentyone and a half inches* in circumference, and *twentytwo inches* long, and he says he has a bushel that will measure 18 inches in circumference.

Recipe for Summer Beer.—Take 4 quarts of molasses, half a pint of yeast, and a spoonful of powdered race ginger; put these into your vessel and pour on them two gallons of scalding hot water to fill up the cask. Let the liquor ferment about twelve hours, when it will be fit for use. It may be kept in bottles to a great age.

An excellent cure for a sprain.—Take two pieces of red flannel, soak or saturate one of them completely with beef or pork pickle, (beef is best) and place it on the wrist or ankle sprained, and wrap the other piece over it, and the pain will subside in a very short time.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, AUG. 17, 1837.

FARMER'S WORK FOR AUGUST.

WINTER RYE.

Soil.—Rye is capable of being cultivated on most kinds of soil, but those which are light and sandy, on which wheat will not thrive, are, commonly, most profitable for this kind of grain. It is not only a proper crop for land of this description, but it answers a valuable purpose on a soil which is too rich to produce wheat. In Russia, according to a communication to the British Board of Agriculture, the produce from boggy lands, drained and sowed with rye, is upwards of forty bushels to one bushel sowed; and they generally use a much smaller quantity of seed in sowing such lands, than is necessary in sowing a soil not so rich.

Mr L. Hommichien, in a paper, contained in *Transactions of the New York Agricultural Society* observed in substance, that a neighbor of his manured twenty square rods of poor, gravelly, dry soil with four thousand menhaden fish, and sowed with rye, at the rate of one bushel to the acre. In the spring it was twice successively eaten off, close to the ground, by sheep breaking in, after it had acquired a height, of nine inches the first time and six inches the latter. These croppings, however, served to make it grow thicker, and stronger than it was before; and when harvested it produced sixteen bushels, or at the rate of one hundred and twenty-eight bushels to the acre; giving to the owner, according to the calculation of Mr Hommichien, at the rate of eighty-five dollars the acre of clear profit. Mr Hommichien said that this account, (which seems almost beyond the bounds of possibility) was attested to by many credible witnesses.

Time of sowing and quality of seed.—From the middle of August to the middle of September is said by most agriculturists to be the best time for sowing rye. In the *Memoirs of the New York Board of Agriculture*, vol. i, page 82, it is said, 'Rye should be sowed the last week in August, or the first week in September, at the rate of about 36 quarts to an acre, some say 48 quarts. But if it is not sowed at that time it ought to be delayed until late in November, so that it may not come up till spring.' A poor soil requires earlier sowing than a rich one. If it is sowed early, and the land is in good till, one bushel of seed to the acre will be sufficient. For late fall sowing, or spring sowing, from a bushel and a half to two bushels will prove a proper quantity. Other things equal, the poorer the soil, the more seed will be required.

There are two advantages to be anticipated from early sowing of this grain. First by sowing early you may provide green seed for your sheep late in the fall and early in the spring; and secondly, by early sowing and seedling in the fall, the roots of the grain take such firm and extensive hold of the soil that they are less liable to be thrown out of the ground by the frosts of autumn, winter and spring, and the plants will be more likely to escape being what is called *winter killed*, which, generally speaking, means being killed by late frosts in autumn, or early frosts in spring.

A writer in the *American Farmer* says 'the great and only secret in regard to insuring a good crop of rye is *early sowing*. From the middle of August to the middle of September, I have always found to be the best time for sowing rye. From three pecks to a bushel per acre is amply

sufficient for seed. Early sown rye is much heavier than that which is sown later; and further, it affords excellent pastures both in fall and spring, nor does pasturing injure the crop; in many cases it is a real benefit—particularly when eaten down by sheep. Clover also succeeds much better after rye than after wheat.'

London says that as rye vegetates more slowly than wheat, it should be sown when the soil is dry; in wet soil being apt to rot the grain before it has germinated.

AMERICAN SILK.

We had the pleasure a few days since of examining a fine specimen of American sewing silk from Mansfield, Con. The gentleman who exhibited it has upwards of 10,000 skeins, for which he finds a ready sale at about \$8.50 per lb. He informs us that about *five lines* have been raised in Mansfield alone this season, and the culture is rapidly extending in Coventry and other neighboring towns. One gentleman in Connecticut last year paid \$1500 for white mulberry trees, with which he has set out an orchard of one hundred acres. About 1000 bushels of cocoons were sent to Philadelphia last season, and were sold for \$3 per bushel. Competent foreigners are now setting up machinery in Mansfield for spinning and weaving the raw article, which has made a great demand for cocoons, and given a spur to the business. By means of machinery introduced a year or two since, the value of the raw silk has been enhanced \$1 per lb. The business is managed almost exclusively by females, requiring very particular attention for only about two weeks each year. The sales of sewing silk in Mansfield about this year are estimated at upwards of \$55,000.

CORRECTION.

Owing to a misapprehension of the manuscript copy of our correspondent 'Oliver's' communication in our last paper, an important omission was made in the first paragraph. It should read thus:

MR PESSERDEN.—In your paper of Aug. 3, I observed some remarks upon an extract from the *Christian Examiner* on the 'Mortgaged farms of N. England.' Although some ideas there expressed may be founded in truth, yet I think the spirit in which the article was penned was bad, and the principles there laid down are unsound, and will have a very injurious tendency wherever they are received. 'A Farmer' says,

'It is true that even in our favored land, political equality is talked about as we would discourse of the millennium, and accounted rather a subject of hope than of present fruition,—yet so far from avoiding it, we are more vigorously at fault, if the grand aim of the founders of our government, was not the nearest practical approach to political equality, or if it does not continue at this day, to be the dearest object of pursuit to every sincere friend of his country, or of the human race.'

I think all those who reflect candidly, unbiassed by prejudice, and from a desire to come at the truth of the matter in regard to political equality, will perceive that all the *real* equality that any government can give a people is the *privilege of giving access to the highest honors and emoluments through merit, or to leave each individual of a nation in perfect freedom to pursue the path which best suits him, to wealth and distinction, so far as he injures no one else*. Any other scheme cannot but be productive of bad results, and prove in the highest degree injurious to the community.

DEFERRED ARTICLES.—We have been obliged to omit several articles prepared for this week's paper for want of room. Among others, notices and hints from 'London's Gardener's Magazine,' including remarks on heating hot houses by hot water, by our able and excellent correspondent of Roxbury. Remarks on 'Farmers and Farmers' Daughters.' Inquiries relative to the use of lead for covering buildings, &c. &c.

From the Boston Courier.

MOUNT AUBURN CEMETERY.

It is gratifying to the friends of this establishment to observe that the number of subscriptions originally contemplated to be one hundred, has been rapidly filled up. At a meeting of the subscribers a superintending committee has been appointed, and it has subsequently been determined to keep open the subscription list until the number of lots taken shall amount to two hundred. This course has been taken to accommodate those persons who have recently offered their names as subscribers, and those who may do so hereafter, and likewise to provide for the more extensive embellishment and security of the place.

To correct erroneous impressions in regard to the expense likely to be incurred by individuals concerned in this undertaking, the committee have thought it necessary to state that no necessary expense will devolve on any subscriber beyond the price of his lot, which at present is sixty dollars. It will be left optional with proprietors to inclose their lots, or to leave them open, to erect costly monuments, or simple ones, or none,—to plant shrubs and flowers, or to leave the soil in a state of nature. No other conditions can be annexed to the conveyance, than such as are necessary to prevent defacement, and to secure a general protection.

To provide for single interments of persons whose friends may not feel able to incur the expense of a lot, it is proposed that one or more lots shall be set apart, to be under the same general protection as the rest of the cemetery.

It is a part of the original design of this establishment, though not an obligatory one, that interments shall be made in single or separate graves, rather than in tombs. The abundant space afforded by the extensiveness of the tract which has been purchased, precludes the necessity of constructing vaults for the promiscuous concentration of numbers. It is believed that the common grave affords the most simple, natural and secure method by which the body may return to the bosom of the earth, to be peacefully blended with its original dust. Whatever consolation can be derived from the gathering together of members of the same families, is provided for by the appropriation of lots, each sufficient for a family, while the provision that the same spot or grave shall not be twice occupied for interment, secures to the buried an assurance of protection and rest, not always found in more costly constructions.

On the same subject another consideration may be added. It is desired that the place may become beautiful, attractive, consoling,—not gloomy and repulsive,—that what the earth has once covered it shall not again revert to light,—that the resources of art shall not be wasted in vain efforts to delay or modify the inevitable courses of nature. It is hoped, therefore, that any sums which individuals may think it proper to devote to the improvement of the place of sepulture of themselves and their friends, may be expended above the surface of the earth,—not under it. A beautiful monument is interesting to every one. A simple bed of roses under the broad canopy of heaven, is a more approachable, a far more soothing object, than the most costly channel house.

We invite the attention of our readers to the list of liberal premiums offered by the Massachusetts Society for Promoting Agriculture, in this week's paper.

NOTICE.

The citizens of Roxbury who are in favor of adopting efficient regulations for protecting their fields, orchards and gardens against the depredations of stragglers, pilferers and vagabonds, are requested to meet at the Town House, on Saturday next, at 7 o'clock, P. M. to organize an Association for that purpose.

Roxbury, August 16, 1831.

Perry.

For sale at the Agricultural Warehouse, No. 52 North Market Street—

A few dozen bottles of excellent Perry, of fine flavor and sparklingly well packed, and wired and sealed in champagne bottles. Price \$3 per dozen. Aug. 17.

Roses, Dahlias, Strawberry and Quicks.

The proprietors of the Albany Nursery have printed a classification of 110 of their finest Roses, according to color, to enable purchasers to select a variety with certainty and economy, with characters indicating the size of the flower, habit and prices. This may be seen at the office of the New England Farmer.

They have imported and propagated many varieties of the finest double Dahlias, which may be selected by the flowers until the frosts of autumn.

They will have for sale, from this time forward, plants of the Methven Strawberry, at \$2.50 per hundred.—Fortyseven of these berries have weighed a pound, and some have measured 4½ inches round. Also many other varieties, for which see catalogue.

They have also for sale, at \$5 per thousand, 50,000 quills of the honey locust (*Gleditsia triacanthus*) for live fences, two years old, and fit for transplanting. Specimens of the fence may be seen at the Nursery.

Orders for any of the above, or for trees, shrubs and plants, may be sent by mail, or left with J. B. Russell.

BUEL & WILSON.

Albany Nursery, July 16, 1831.
Aug. 10. 3t

Zine Milk Pans.

For sale at the Agricultural Warehouse—Westfield's patent Zine Milk Pans. A particular account of this great improvement in dairymaking will be found in the New England Farmer for July 6, 1831, page 105, and many other journals. Milk in these pans will keep sweet longer than in those of other materials, and thus consequently afford a longer time for the cream to rise, and produce one sixth more butter, as has been proved, of the sweetest quality. The pans are very durable, and not likely to rust.

NOTICE.

The undersigned being owner of the Letters patent for the manufacture of the above article, hereby cautions the public from trespassing on his patent right, as they would avoid the penalty of the law; and also gives notice that he has appointed J. R. Newell, proprietor of the Agricultural Warehouse in the city of Boston, his Agent for vending the above articles.

Aug. 3. CHARLES BISHOP.

Bees.

The Subscriber has 300 swarms of Bees for sale, in his Patent Slide Beehives, at 20 cents per pound, weight of each swarm from 40 to 100 lbs. tare of hive deducted; the price of the Patent hives is \$2 a piece, and the price of a single right \$5.

Also for sale, 200 swarms of bees in the old fashioned hive, price 17 cents per pound, tare of hive deducted.

The above will be delivered within fifty miles of Boston, in good order, (warranted free from moths or other vermin damage) by the first day of March, 1832.

All letters must be sent in before the first day of September, 1831, post paid, to the subscriber, at Brighton, Mass. so as to have time to transport them from Maine.

N. B. The weight of the above hives will be taken in September.

EBENEZER BEARD.

July 6 ep2m

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Aug. 3.

Black Currant Wine.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A further supply of superior old Black Currant Wine, made under the inspection of John Prince, Esq. Roxbury; an account of its stringing and detergent properties in various complaints, will be found in the N. E. Farmer, vol. 5, page 267, written by S. W. Pomeroy, Esq. and the late Doct. J. G. Coffin. It is highly salutary in many summer complaints. Doct. Coffin states: "It has been attended with remarkable success in the early stages of cholera morbus and dysentery—and again also in the later stages of these diseases, after the symptoms of inflammation or febrile excitement had ceased." It has been strikingly remedial in the low states of typhoid and bilious fever. The late Capt. Gilchrist, who for several years followed the Patavia trade, and who had always suffered an attack of the severe cholera which proves so destructive of human life in that climate, used to say that after he had this wine with him, and took two glasses of it every morning, he escaped the disease. On one voyage, his mate, who had not taken the wine, was seized with this complaint, when a bottle or two stopped its progress. We have not room to enumerate in any other morbid affections in which this wine has proved useful. In sore throat it has for many years been considered almost a specific remedy.—Price 75 cts. per bottle. Aug. 3.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention.

EBENEZER WIGHT.

46, Milk street, opposite Federal-st., Apothecary.

August 3. copf

Tulip Roots.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A splendid collection of Tulip Roots, now in fine order for transplanting, comprising some of the most beautiful varieties now cultivated in this vicinity, viz:

Marbled or mottled, dark stamens.
White and Purple, ditto.
Yellow and Purple, ditto.
Double Yellow Rose.
Double pale yellow flamed, (Passe non plus ultra.)
Crimson, yellow centre and yellow stamens.
White, shaded with red, dark centre and stamens.
Fine large yellow, with yellow stamens.
Double white, with red shades, (beautiful.)
Double orange brown, (very large.)
Double prunny rose.
Double coffee color.
Parrot tulips, of several colors.
Fine bloods, (stained on white ground.)
Fine bizzars, (stained on yellow ground.)
Fine Rosy, on white, &c., &c. Price 12½ cts. each—\$1 per doz.

The above are of large size, and are raised from superior imported roots, some of which cost \$1 each.

Also, common tulip roots, of all colors, and of good size, price \$5 per hundred, suitable for those commencing a large tulip bed.

Also, Double White and Yellow sweet scented Narcissus—12½ cts. each—\$1 per doz.

Mixed Crocus roots—50 cts. per dozen. Aug. 3.

Seeds for Fall Sowing.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

Garden and Field Seeds, suitable for fall sowing, among which are—

WHITE PORTUGAL ONION.

PRICKLY SPINACH, (for early greens.)

BLACK SPANISH OF WINTER RADISH.

LONG DUTCH PARSNIP, and a variety of other garden seeds.

Also—TIMOTHY OF HERDS GRASS—ORCHARD GRASS—RED TOP, RED and WHITE CLOVER, &c. &c. Aug. 3.

Ammunition. £1

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6, Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. If Jan.

Dale's Hybrid Turnip Seed.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A few packages of seed of this new variety of turnip, so highly esteemed in Scotland, and which is described in No. 3, vol. x. N. E. Farmer.—Price 12½ cts. each paper.

Turnip Seed.

For sale at the Seed Store connected with the New England Farmer, No. 52 North Market Street, Boston, 200 lbs. White Flat Turnip Seed, the growth of the present season, raised in this vicinity expressly for this Establishment.

Also—Ruta Baga of the very first quality, of both American and European growth; Yellow Aberdeen, Yellow Stone, White Norfolk Field, and Yellow French Turnips; Long Prickly and other Cucumbers, for pickling, warranted genuine and fresh. July 6.

BRIGHTON MARKET—Monday, Aug. 15.

[Reported for the Chronicle and Patriot.]

At Market this day 520 Beef Cattle; 10 Cows and Calves; 32 Stores; 2245 Sheep and Lambs, and 459 Swine. About 150 Beef Cattle remain unsold.

PRICES.—Beef Cattle—Considerable depression from last week, particularly on thin and grass fed Cattle, sales were very low and uneven. We shall quote for prime \$1 75 and 5 17, good 4 25 a 4 15, thin at 3 50 a 4.

Cows and Calves.—We noticed sales at \$15, 19, 22, 25, and 30.

Sheep and Lambs.—Sales were effected for this lot at 1 62 a 1 75, good at 1 88 a 2 12½, prime 2 25 a 2 50.

Swine.—At retail 5c. for Sows and 6c. for Barrows.—No sales of lots noticed.

MISCELLANY.

From the New England Review.

THE VAUDOIS TEACHER.

'The manner in which the Waldenses and heretics disseminated their principles among the Catholic clergy, was by carrying with them a box of tunkets, or articles of dress. Having entered the houses of the gentry and disposed of some of their goods, they cautiously intimated that they had commodities far more valuable than these—estimable jewels, which they would show if they could be protected from the clergy. They would then give their purchasers a bible or testament; and thereby many were deluded into heresy.'—*See Rerigious Sackcho's Book, A. D. 1258.*

'Oh, lady fair, these silks of mine are beautiful and rare—'

The richest web of the Indian loom, which Beauty's self might wear;—

And those pearls are pure as thy own fair neck, with whose radiant light they vie;

I have brought them with me a weary way,—will my gentle lady buy?'

And the lady smiled on the worn old man, through the dark and clustering curls

Which veiled her brow as she bent to view his silks and glittering pearls;—

And she placed their price in the old man's hand, and lightly turned away.

But she paused at the wanderer's earnest call—'My gentle lady, stay!'

'Oh, lady fair, I have yet a gem which a purer lustre brings

Than the diamond flash of the jewelled crown on the lofty brow of kings—

A wonderful pearl of exceeding price, whose virtue shall not decay,

Whose light shall be as a spell to thee and a blessing on thy way!'

The lady glanced at the mirroring steel where her form of grace was seen,

Where her eye shone clear, and her dark locks waved their clasping pearls between;—

'Bring forth thy pearl of exceeding worth, thou traveller gray and old—

And name the price of thy precious gem, and my pages shall count thy gold.'

The cloud went off from the pilgrim's brow, as a small and meagre book.

Unclasped with gold or diamond gem, from his folding robe he took:

'Here, lady fair, is the pearl of price, may it prove as such to thee!'

Nay—keep thy gold—I ask it not, for the word of God is free!'

The hoary traveller went his way, but the gift he left behind,

Hath had its pure and perfect work on that high-born maiden's mind,

And she hath turned from the pride of sin, to the lowliness of truth,

And given her human heart to God in its beautiful hour of youth!'

And she hath left the gray old halls, where an evil faith had power,

The courtly knights of her father's train, and the maidens of her bower;

And she hath gone to the Vaudois vales by lordly feet untrod,

Where the poor and needy of earth are rich in the perfect love of God! J. G. W.

EPIGRAM.

The Coquette Reproved.

'Tis strange that I remain a maid,
Though fifty swains have homage paid!
The reason you have told, says Fanny,
You had just fortune too many!

It is said, that in olden time, it was an article in apprentices' indentures in Boston, that they should not be compelled to eat salmon more than twice a week.

While Sir H. Davy was with Mr Borlase, surgeon, an apprentice, it was his constant custom to walk in the evening to Marazion, to drink tea with an aunt, to whom he was greatly attached. Upon such occasions, his usual companion was a hammer, with which he procured specimens from the rocks on the beach. In short, it would appear that, at this period, he paid more attention to philosophy than to physic: that he thought more of the howels of the earth, than of the stomachs of his patients; and that, when he should have been bleeding the sick, he was opening veins in the granite. Instead of preparing medicines in the surgery, he was experimenting in Mr Tonkin's garret, which had now become the scene of his chymical operations; and, upon more than one occasion, it is said, that he produced an explosion which put the doctor and all his glass bottles in jeopardy. 'This boy, Humphry, is incorrigible! 'Was there ever so idle a dog?' 'He will blow us all into the air!' Such were the constant exclamations of Mr Tonkin: and then, in a jocular strain, he would speak of him as the 'philosopher,' and sometimes call him 'Sir Humphry,' as if prophetic of his future renown.—*Paris' Life of Sir H. Davy.*

Fuseli.—He was too full of feeling not to reverence his Bible, and he was at all times difficult to please with modern attempts to embody scripture.—When Northcote exhibited his 'judgment of Solomon,' Fuseli looked at it with a sarcastic smirk on his face. 'How do you like my picture?' inquired Northcote. 'Much,' was the answer—the action suits the word—Solomon holds out his fingers like a pair of open scissors at the child, and says, 'Cut it,' I like it much!

One day he saw a figure from which the students were making drawings, lying broken to pieces. 'Now who the devil has done this?' Mr Medland, sir, said an officious probationer, 'he jumped over the rail and broke it.' He walked up to the offender—all listened for the storm. He calmly said, 'Mr Medland, you are fond of jumping—go to Sadler's Wells—it is the best academy in the world for improving agility.'

Veneration for a Fiddle.—A German writer, of whom I afterwards knew a little, was in some respects an original world studying, though not imitating. He loved nothing so well as fiddling, and had two violins, a best and a second best, on the first of which, I firmly believe, he would not have allowed his own father to draw a bow. Quitting England to settle in South America, he tore himself from his beloved instrument for the first time; but it was only to export it, highly insured, in a different, and as he thought, a safer ship, than the one he was to sail supercargo in!—*Harmonicon.*

Traveller's Direction.—A traveller relates the following as a literal direction given to him by an inhabitant of a remote New England town, in reply to his inquiry for the direct road to — meeting house. 'Well, ah, stranger, you go right straight ahead, till you come to a large oak tree, then you take that are tree on your right shoulder, and then you come to the brick school house—then take the brick school house on your left shoulder, and keep straight on till you come to Squire Wingate's; and then do you take the square's house right on your back, and you can't miss the way.'—*Ms. Jour.*

A Convenient Nap.—Two Oxford scholars slept in the same room at College. 'Jack,' says one, early in the morning, 'are you asleep?' 'Why?' replied the other. 'Because, if you are not, I will borrow half a crown of you.' 'Is that all? then I'm sound asleep.'

'I have lived,' said Dr E. D. Clark, 'to know that the great secret of human happiness is this: never suffer your energies to stagnate. The old adage of "too many irons in the fire," conveys an abominable lie. You cannot have too many—pokers, tongs, and all!—keep them going.'

Medical School in Boston.

The Medical Lectures of Harvard University delivered in Boston will be commenced in the Autumn, at the usual period, viz. on the *third Wednesday in October.* They will be continued four months.

This extension in the term of the Lectures has been thought necessary to afford time for such a course of instruction and demonstration, as is deemed by the Faculty to be requisite, under the advantages which have recently accrued to the School.

The Legislature of Massachusetts, with an enlightened liberality, which does honor to our age and country, have extended the protection of law to the cultivation of Anatomy within this Commonwealth. The advantages which will hence result to students resorting to this school will be sufficiently obvious. It will be the aim of the Professors to carry into effect the intentions of the Legislature, in such a manner as to evince at the same time their respect for the rights of humanity, and their interest in the promotion of the healing art.

The opportunities for practical instruction at the Massachusetts General Hospital continue undiminished.

The course of Lectures will be—

On Anatomy and Surgery, by Dr Warren.

" Chemistry, by Dr Webster.

" Materia Medica, by Dr Bigelow.

" Obstetrics and Medical Jurisprudence, by Dr Channing.

" Theory and Practice of Physic and on Clinical Medicine, by Dr Jackson.

WALTER CHANNING,

Dean of the Faculty of Medicine.

Boston, June 15, 1831. 61 july 16

Lynn Mineral Spring Hotel,

Ten miles from Boston, Six from Nahant, and Five from Nahant.

The subscriber most respectfully begs leave to inform his friends and the public that he continues to keep that delightful Summer retreat, the Lynn Mineral Spring Hotel, which it will be his object to render a genteel and pleasant resort for Boarders, Parties of Pleasure, transient Visitors, &c.

The salubrious qualities of the waters of this celebrated Spring—the beautiful lake, on the borders of which the establishment is situated, abounding with fish of various descriptions, and surrounded with the most wild and romantic scenery—splendid Boats for sailing or fishing—Bathing rooms on the margin of the lake, where the warm or cold bath may at any time be taken—the delightful situation of the House, with its comfortable and well furnished apartments, with the fruit and flower Gardens adjoining, are attractions for those in pursuit of health or pleasure, rarely equalled if equalled in any part of the country.

Every exertion shall be made to merit a continuance of that patronage which has been so liberally bestowed. JAMES W. BARTON.

Cocoons Wanted.

The Subscriber will pay cash for Cocoons, from 25 to 50 cents, according to quality. J. H. COBB.

Dedham, July 15th, 1831. St July 20.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly hand bound and lettered, at 75 cts. per volume, by leaving them at the Farmer office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, AT NO. 52 NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE).—T. G. FESSENDEN, EDITOR.

VOL. X.

BOSTON, WEDNESDAY EVENING, AUGUST 21, 1831.

NO. 6.

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

MR FESSENDEN—Will you permit me to employ a rainy day in selecting a few hints from the last number of London's Gardener's Magazine which may amuse those who have not access to that publication.

The present season (in Great Britain) has been in almost all respects the same as with us. It was forward, and the prospect of fruit was fine. But on the seventh of May the wind came round to northeast, and became cold, and destroyed the prospects of fruit completely. Some attempts at computing the loss had been made; the conductor of Covent Garden market says that on the most moderate calculation it will amount to £100,000, 450,000 dollars. In this estimate he says he includes only the district round London, but in computing the losses through the kingdom £2,000,000 or nearly nine millions of dollars have been spoken of.

Some ideas of the effects of the apprehended scarcity may be formed by the following prices at Covent Garden market. Shelled green peas (May 20th,) 19 dollars a quart!! Peaches per dozen, 13 dollars. Cherries per pound, 8 dollars. Strawberries forced, per ounce, from 11 cents to 52 cents. Hot House Grapes from two to five dollars per pound.

Great improvements have been made in the plans of heating hot houses with hot water. The principal one consists in reducing the size of the boiler. From experiments which I made in the hot water system, the last winter, I became satisfied that the boilers could scarcely be made too small. There are two objects to be effected by any apparatus, whether smoke flues, steam pipes, or hot water tubes. The first, to get up the heat in shortest possible time. The second to retain the heat as long as possible with a given quantity of fuel. The principal advantage proposed by the hot water system is confined to the last, but the learned Tredgold has suggested a mode by which the hot water system may effect both.

Mr John Mearns, whom Mr London, and Mr Knight (in their controversy about Mr Knight's improvements in raising pine apples) agree is a most excellent gardener, gives the following account of some cheap hot water apparatus now in actual operation. The inventor is a Mr Osler of Worcester. The boiler for small pits should be two gallons, pipes three inches bore—feeder 7 gallons. The boiler and pipes for a grapery are large; the boiler is of copper and contains 5 gallons, and costs only 13 dollars 33 cents; pipes for this large boiler 3 inches, the feeder 30 gallons; it works excellently. The grapery boiler measures 28 inches by 18 inches; the depth is not given, but as it holds only 5 gallons it cannot be more than 3 inches deep. This is very probable, because Weeks' patented apparatus in use for two years past and so strongly recommended by London has only one inch of water in depth, though the boiler is 18 feet long. The object in both cases being to heat the water as rapidly as possible. Mearns retains his smoke flue very properly, it being a useless waste not to

avail ourselves of the heat left in the smoke, after it has passed the boiler. He proposes to have both the furnace and the boiler within the house. Mr Tredgold's article has appeared in Vol. vii. part iv. of the London Horticultural Society's Transactions, and from extracts in London's Magazine, I see it is strictly scientific, and enables you to know precisely how much pipe you must have for a given number of cubic feet of air in your house. I have not yet received that Number of the Transactions.

The Hardenpont de Printemps pear, which the French Gardeners have called Beurré Rance has come into bearing this year with me. It resembles exactly in shape the drawing of it in the London Horticultural Transactions.

This is another example of Mr Knight's accuracy. If it will keep till April, is an abundant bearer, and as good in our climate, as it is found to be in Flanders and Great Britain, it will be far the most valuable of all new fruits sent to us.

I have two Pears of the Duchesse Angoulême, from a scion, given to me in 1829, by my friend S. J. Perkins, Esq. It is correct, perfectly so, though the Pears are smaller than they should be owing to the weakness of the shoots.

I have some fine healthy pears on a tree of Mr Knight's which I have always called the Tillington, but the Pears seem to resemble the Urbaniste, more than what I should have expected according to Mr Knight's description. 'Tillington produced between the Jargonelle and Autumn Bergamot; its form between both.' Now I should expect from this a pear shaped like a St Michael. But the fine looking pears I have upon the Tillington are globular, more so than any pear known to me.

Mr Knight's Wormsley Grange, (one of his own raising) has fruit on it. He says of it, 'It will require to be gathered in your climate before it is ripe.' It is in Herefordshire a variety of first rate excellence, rivaling the Brown Beurré in the most perfect state of that variety.

I infer from this, that it is an Autumnal Pear or he would not counsel us to gather it before it is ripe. At present it does not bid fair to be large, though it is a remarkable healthy vigorous variety, a matter of great importance to us in the country where Pears are very delicate productions.

Exbury, August 3, 1831.

J. L.—

SHEET LEAD FOR THE ROOFS OF HOUSES.

MR EDITOR,—I understand that sheet lead is made use of in some of our southern states, for covering the roofs of buildings. As it would undoubtedly, (if well laid on) preserve the buildings dry as long as they lasted, and then answer for other uses, I think it must be far superior to shingles, as they require new laying as often as once in about 20 years, and are sometimes subject to leak in 10 or 15 years, also to taking fire from the chimney or other buildings and being consumed. I think that lead may be laid on from roll, in long strips running parallel with the roof likeroofs of shingles, but probably much wider, with the edges lapped just sufficient to shed water wet, and the top lap of the ends, (in splicing) cut sloping to a point on the upper edge of the strip so as to shed water better. Thinking it may be of

advantage to others as well as myself to be informed on this subject, I wish to make inquiry through your paper, respecting the cost of covering roofs with lead in comparison with good shingles, and 1000 square feet of roof, and respecting the best mode of putting it on, also the cost of covering roofs with slate or other substances, on 1000 feet and their durability and use as a preservation from wet. It will be well to have the weight of each material mentioned that the cost of transportation may be estimated.

Your obt. servant,
Mendon, Aug. 3, 1831.

B. A.

We are informed that 2½ lbs of the thinnest kind of sheet lead is the weight of a square foot, and the cost is about 15 cts. for that quantity. A thicker kind may be had at 18 cts. the square foot, weight 3 lbs. We cannot tell what would be the price of putting it on, nor how it would compare with slate &c.—EDITOR.

FOR THE NEW ENGLAND FARMER

NEW FRUITS.

T. G. FESSENDEN, ESQ.

DEAR SIR—The introduction of the most valuable vegetable productions of other countries being an object of such great interest to Horticulture, it has been a primary object with us to obtain every species and variety calculated to enrich the gardens of our country; in doing which we have taken the utmost precaution to receive only such as were from unobscured sources. The acquisitions during the past spring alone, are so very numerous, that they would form an extensive catalogue. The acquisition of new fruits is 'of the most particular interest, and to it the most pointed attention has been paid, and the course we have adopted of obtaining the same variety from three or four sources, so as to prove it by comparison, must insure a degree of accuracy not to be otherwise attained. The new Pears originated in Belgium during the last fifteen years have become as famed in the catalogues of choice fruits, as the name of Professor Van Mons has become celebrated among the distinguished pomologists of our day. It is with great pleasure therefore that we have to mention him among the liberal contributors to our establishment. In February last he transmitted to us above 70 varieties of pear trees which he states in his letter as '*Des plus nouvelles variétés, du premier rang*,' the newest varieties of the first rank. These he accompanied by engravings and descriptions of a number of the kinds, from the latter of which we intend ere long to make translations, as well as from his copious letters which abound with interesting matter. In one of the periodicals received from him there is a detailed statement of three cases of hydrophobia where the patients were successfully treated and perfectly cured, which we propose also to translate for publication. There is another subject beside horticulture on which the learned Professor dwells with particular enthusiasm, and in which he appears to have taken an active part; that will also be highly pleasing to our American feelings: it is the Revolution and the Independence of his Country. On this subject he expatiates with equally as much warmth

as on horticultural objects; and with justice anticipates by the success of the former, more extensive and wide spread benefits from the latter.

As the list of fruits received will be interesting to many we annex it hereto. It will be perceived that some of the varieties had previously reached us, but the renewal of them from so undoubted a source is a matter of high interest.

Very respectfully, WM. PRINCE & SONS.

List of new varieties of Pears transmitted by Prof. Van Mons to the Messrs Prince.

FRUITS.

MR FESSENDEN.—As this is the season for the Green Gage to ripen, I take the liberty to call the attention of the cultivators of this delicious fruit, to a fact that is, I believe, not generally known, and which has occasioned much discussion among gentlemen who suppose themselves acquainted with this fine plum. Cultivators of fruits have for an hundred years past, and upwards, employed much of their time in discussing, and endeavoring to fix correct and true names to fruits which have fallen under their observation. The celebrated *Duhamel du Monceau* has perhaps done more to accomplish this object than any other individual whatever; and ever since the publication of his great work on Fruit Trees in 1768, he has been acknowledged throughout Europe as the best, (and of course a standard,) authority, so far as he had published his opinions on these points.

My object in making this communication is to correct a common error that prevails among horticultural gentlemen here, who frequently mistake the 'Petite Reine Claude' for the Green Gage;

and the most effectual means perhaps of correcting this error is to give *Duhamel's* description of the two fruits—the 'Grosse' and the 'Petite Reine Claude.'—Nothing can be more desirable among cultivators of fruit than a correct nomenclature, as it prevents the grafting of one fruit for an other, and of course prevents, not only a great loss of time which necessarily elapses before the error is discovered, but saves the cultivator much expense; and much vexation when he ascertains that his labor has been in vain.—Indeed nothing is more important in this branch of horticulture, and he who contributes most effectually to this object may be said to have rendered the greatest service to the Fruit Garden, and the lovers of good fruit.

The case I have cited is one out of a hundred where mistakes have crept into publications and reports on the subject of the names of fruits—but by the attention and caution of some of the leading members of your society it is to be hoped that the evil of misnaming fruits will in a few years be corrected.

I have been informed with much pleasure that GEN. DEARBORN means to make a communication relative to the new sorts of Pears which have been given to the world by the persevering care and industry of the celebrated 'VAN MONS'.—The pains which General Dearborn has taken to open and maintain a correspondence with some of the most distinguished horticulturists of Europe, does him great credit, and must be highly beneficial to the Massachusetts Horticultural Society, of which he is most deservedly the Head; and if industry, intelligence, and urbanity (properties which eminently belong to this gentleman) have their usual success, he cannot fail to be, if he is not already, the *Soul* also.—I do not mean however to detract from the merits and usefulness of other officers of that respectable Society, many of whom I know possess information and diligence that are highly honorable to themselves and beneficial to the common cause in which they have engaged—but I mean to say that I do not think they could have shown their wisdom and good sense in a stronger point of view than they have done in the choice of Gen. Dearborn as their President.

If I am rightly informed, this gentleman has received direct from Prof. Van Mons, a catalogue of all his best fruits, with sketches of some of the most distinguished sorts, accompanied with accurate descriptions of each from the pen of the cultivator himself.—Here then there can be no mistake as to names, and when, as I understand, we have a right to expect, this distinguished horticulturist shall have sent scions of each sort, with their name affixed to each, it will be our own fault if we do not preserve them distinctly.—If a scion of each kind should be intrusted to your active member MR MANNING of Salem, whose intelligence and accuracy in this department is well established, it may be the most certain means of keeping the several species from being blended with other sorts, and thereby hand them down to posterity with their legitimate names.

August 22.

A CULTIVATOR.

Subjoined are a few of the distinguishing characteristics of the trees, Grosse and Petite Reine Claude, together with the descriptions of the fruit of each tree.

Grosse Reine Claude.—This fruit is called also —'Dauphine,' 'Abricot Vert,' and 'Verte bonne,'—this is the true

GREEN GAGE.

The shoots of this tree are thick, and their bark brown and smooth, a little reddish on the sunny side, towards their extremities, and green opposite.

The buds are medium size, and near together, but their shoulders are very large and projecting.

The fruit is large, round, a little depressed at both ends.

The stalk medium size—is set in a pretty deep cavity. The furrow which divides this fruit is scarcely perceptible, the fruit being flattened on this side. It is subject to crack if it rains much when it is ripe—they are most esteemed in this state.

The skin adheres to the flesh—it is thin, green, spotted with gray, lightly tinged with red on the sunny side.

The flesh is a yellowish green—very fine, delicate melting.

The juice is abundant, sugared, and of an excellent flavor.

The stone adheres partially to the flesh—it is the best of plums.

PETITE REINE CLAUDE.

The shoots of this tree are more slender than those of the Grosse Reine Claude; they are dark red next the sun, and green opposite.

The buds are long—very much pointed, and lie nearly flat on the branch—the shoulder is large.

The leaves are smaller than those of the Grosse Reine Claude.

The fruit is medium size, round, flattened particularly at the end next the stalk, and with a deeper furrow than that of the Reine Claude.

The skin is tough—of a whitish green, covered with a very white powder.

The flesh is white, firm, rather dry—sometimes melting, but rather coarse.

The juice is sweet—but less flavored than the Grosse Reine Claude—sometimes a little acid.

The stone never adheres to the flesh—it is esteemed a good fruit although inferior to the Grosse Reine Claude.

MR COKE OF NORFOLK—THE GREAT ENGLISH FARMER.

The New York Enquirer, after complaining that this distinguished member of the English commonalty should, as report says of him, accept a peerage, adds some memoranda of his enterprise and success as an agriculturist. The statements we presume, are substantially, if not perfectly correct, as they correspond to what we have learned from other sources.—*Christian Register.*

A good deal has been said lately in our papers, about the cost of elections in England; perhaps the case of Mr Coke may not be generally known: as we never see it mentioned, we suppose this to be the case. His last contest for Norfolk cost him £75,000, or about \$350,000, and once it cost him £90,000, or about \$375,000, including exchange.

But how can he endure such enormous expenditures—and what is the object really worth? As we are apt to measure worth in this country, the object is worth just nothing at all, being productive only of further and considerable expense, without emolument or profit. Wealthy men, however, in that country as in this, love power, and are willing to pay for it; love to lay out their money on something—no matter what—which other people cannot afford. Hence the geometrical ratio in which diamonds are estimated; hence the value of a white elephant in the East, even to a mon-

arch; hence the extravagant price we pay for cashmere shawls, blond laces, &c., &c.—no one of which would be thought half as beautiful, if they cost but half as much. But how can Mr Coke afford to throw away so much money? Simply because he is a great farmer, who has lived long enough to enjoy the results of experiments made in his youth,—to eat of the tree that his hands planted half a century ago.

When he came into possession of the estate he was poor, and the estate poorer. The whole was not worth £2,000 a year; what it is now, he himself has made it. There were 11,000 acres of land lying waste, which had been let for three shillings an acre. When the lease expired, the man who had it would not offer more than two shillings an acre for a renewal. 'No,' said Mr C., 'I will keep it to breed pheasants and game—it will be worth more than two shillings an acre to my friends, if not to me?' The man would give no more, and Mr Coke went forthwith to planting oak, larch, and sweet chestnut, as they call it there to distinguish it from the horse chestnut—over the whole of his magnificent reserve. He persisted, year after year, until he had covered the whole; and when he came to be married, it was valued by competent appraisers, with a view to the marriage settlement, at 222,000*l*. In the county of Norfolk, he owns over 60,000 acres of land, either under a high state of cultivation or well worked; 5000 acres of which he actually farms out on his own account,—it is eleven miles round his park. When he began to revolutionize Holkham, fifty years ago, it cost him ten thousand dollars a year for timber to keep his fences and buildings in repair, (apart from his own house, that being a palace, and fitted for the wear and tear of centuries;) but within the last eighteen years, he is not only able to supply himself with timber, but to sell about twenty thousand dollars worth of *poles* every year, from clearings which are continually made, where the smaller growths get crowded, or the larger trees interfere with one another. For the last twenty years, he has regularly planted one hundred acres, every year, with timber trees. He has five regular auctions a year, and puts up these *poles* in lots of 260. The timber is in high credit, and the sales average about \$4000 each, or \$20,000 a year. The monthly expense of his establishment at Holkham, is about \$5000; he keeps 70 servants, 45 being men servants. In a word, he is the builder of his own private fortunes—a strong-minded, straight forward, useful man,—a self made philosopher, and what is more, a practical farmer; living under that extraordinary system of poor laws, where men are bribed to pauperism and precipitate marriage, he has contrived to keep the whole country, far and wide, in a healthy state, by the mere influence of a quiet and sober example. *What had such a man to do with a peacoe?*

HUDSON AND MOHAWK RAIL ROAD.

We have had the pleasure to examine personally this road as it at present terminates at the head of Lydius st. The following is the appearance as it struck us. As you approach the farm belonging to our present mayor, you perceive wagons constantly passing up with heavy loads of stone. At the right of the road, a small temporary building is erected, and on entering this, your eye involuntarily is arrested by a strange yet elegant piece of machinery, mounted upon four iron wheels, while at the same instant it glances beyond, through a

long vista, for miles and miles over a straight and regular road, on which are two rails that vanish far away from you in the distance.

At first you exclaim, 'how simple after all is a rail road,' but the mind seems to respond, 'how vast and incalculable are the effects of this simplicity?' The friction existing on a common road on a level surface, or increased by gravity in the ascent of hills, seems to destroy the native powers of man and beast. All the apparatus of wheels and springs are but poor remedies for the practical difficulties which have beset the traveller. But the construction of rail roads gives him the victory over these, and they dwindle down to comparative nothingness. Sixty miles in an hour have been run upon the Liverpool and Manchester road, and this may be done on the Mohawk and Schenectady road. It is a very strong wind that travels at this rate; it is the velocity of most of the feathered tribe. All these reflections occur to the mind on visiting this interesting road. The locomotive engine, which will open the travel upon it in a few days, was built at the West Point foundry, upon a plan of Mr Hall, and is very appropriately named the *De Witt Clinton*.

It is about 11 feet 6 inches in length, and is mounted on very solid and elegantly constructed iron wheels of four feet eight inches diameter. The boiler contains 115 gallons of water, and will sustain a pressure of several hundred pounds to the inch, although it is intended to work at a pressure of 50 pounds only. There are two cylinders, one on each side of the engine, towards the rear of the boiler, each of 5½ inches diameter, and 16 inches stroke. The pistons move on the inside of the wheels, which is an improvement upon the English engines. The shafts are connected with the axle of the front wheels, which is bent into the shape of a double crank. Attached to the boiler is a very pretty piece of work, being a glass tube, securely cased in brass, shewing the state of the water in the boilers. There is a safety valve on the top under lock and key, and a *self-acting* spiral safety valve near the chimney, which allows the steam to blow off when it reaches any proposed mark upon the graduated scale attached to it.

The power of the engine is over ten horses, and its weight is 6758½ lbs. being much less in proportion than that of the best English engines. As it now stands on the rails, it can be very easily moved by a single hand! The tender is a carriage mounted on smaller wheels and carries a square box with an awning upon it, in which are apartments to hold an iron tank and the requisite quantity of Laekawana coal. It is dragged next the locomotive and has a stout spring in front to keep it at the same distance relatively from the engine.—Behind these come the Coaches for the passengers. These run on iron wheels constructed like the rest with a flange or inner edge, which makes it impossible for them to run off the rails. And here it may be well to remark that the rails are about six inches wide, and have on the top a continued iron bar of wrought iron, on which the wheels run. The coaches are built like the common post coaches peculiar to our own country, and will carry inside and out about 20 passengers each. They are very comfortable and convenient. Experiments will be immediately made to test the fitness of all this varied apparatus, and soon we expect to see all the travel diverted to this road.—The income will be enormous, but it will be no more than a just return for the spirit and energy of those who

embarked their fortunes in the noble enterprise. That the state will in time take the road under the charter, we do not doubt, provided this is the only one of the kind between Albany and Schenectady.—*Daily Ad.*

SILK.

We had anticipated commencing upon this subject which we consider of national importance, as soon as we had given our readers what information we deemed necessary respecting flax; but we perceive by our last New England Farmer, that Massachusetts is on the alert, and that a forthcoming work on this subject is announced in compliance with a resolution of their legislature, and we may defer the subject until we are favored with a perusal of the work. So we go—Massachusetts stands god-father for the United States; or rather she seems doing what the United States should have done—encouraging the produce of silk.—*Genesee Farmer*.

Odoriferous Substances Offensive to Insects.—It is said that the common mint strewed among grain as it is mowed away in the barn, will preserve it from being injured by vermin. Camphor, when kept among bed clothes, will keep away bed bugs and fleas. From these circumstances, together with the fact that we do not recollect of having seen plants strongly odoriferous injured by insects, we are led to conclude that farmers might be benefited by turning their attention to the subject.—*New York Farmer*.

HORTICULTURE.

Horticultural Hall, }
Saturday, August 20, 1831. }

FRUITS EXHIBITED.

From Mr Otis Puttee—Red and white Rarierpe, red and yellow, do., McKeaton, Admirable, Noblesse and ——— Peaches, of beautiful appearance and fine quality.

From Mr R. Manning—Lady Hailey's Nonsuch Apples—Orange Musk, fine appearance, but inferior in quality (Coxe No 14)—Washington, good flavored and very fair; and Pears, name unknown, from a French tree.

From J. Prince, Esq.—Summer Pearmain Apples, of high reputation, and Pears from a French tree.

From Mr Thomas Milton, of Roxbury—Fine red and yellow Rarierpe Peaches.

From Mr E. Bartlett—Pears from a French tree.

From Dr Robbins—A further specimen of the Crimson Apples, exhibited last week.

From Dr B. Shurtleff—A very large sweet Apple, called by him the Hancock Sweeting.

From Benjamin Guild, Esq.—Russeting Apples of last year's growth, put into an ice house in January, and are now in a good state of preservation.

From H. Newman, of Roxbury—Purple Fox Grapes.

From E. Phinney, Esq.—White Native Grapes.

From Perrin May, Esq.—White sweet water Grapes, raised in open ground, Boston.

From Mr Edward Sharp, Dorchester—White sweet water Grapes, open ground.

From John Woodbury, Esq. Boston—White sweet water Grapes, open ground.

From Mr Moses W. Copeland, of Princeton—A specimen of white Whortleberries, very delicate.

From Mr R. R. Schanck, Middletown Point, N. J.—Red Juneating Apples, a very popular fruit, well known and extensively cultivated in this vicinity.

From Dr Green of Mansfield, A sample of the fruit of the Lime plant (*Podophyllum peltatum*.)

By order of the Committee on Fruits.

EDWARD M. RICHARDS.

From the Genesee Farmer.

OKRA, TOMATO, AND EGG PLANT.

MR. EDITOR.—As you invite information in regard to the culture of okra in our latitude, I take occasion to say, that I have cultivated it six or eight years, with general success, and that I subscribe to your high commendation of it. It is the *Hibiscus esculentus* of botany, of the natural order *malvaceae*, a family of plants abounding in mucilage, and showy in the flower border. I have the okra now in blossom, and may expect pods fit for use in ten to fourteen days. I use it principally in soups; though it affords a nutritious and healthy dish for weak and debilitated stomachs when boiled plain and seasoned to the taste. As the plant requires warm weather to bring it forward, it should not be sown in the open ground till late in May. The rule for planting melons, viz: when early planted Indian corn has come up, applies to this and most other tender plants introduced from warmer climates. I plant in a rich loam, rather dry, and open to the sun; and as the plants are liable to be eaten by grubs, I am not sparing of seed. I have this year started the okra, as well as other tender plants, under glass, with little or no bottom heat, and transplanted in June.

While on the subject of rare garden productions I will mention, that I also cultivate with success the tomato (*Solanum Lycopersicon*) the Egg plant (*S. melongena*) and the Bene (*Sesamum orientale*). These were started this year under glass with the okra. I have the first with full grown fruit, the second in bloom, and the third in an advanced state. The tomato, from its anti-bilious properties, is highly conducive to health, and becomes, by a little use, one of the most desirable dishes upon the table. The egg plant, properly prepared, has a greater affinity, in taste, to the oyster, than any other vegetable I am acquainted with. The purple variety is principally used for culinary purposes. I have a new variety growing, the seeds of which were brought from Constantinople, by Mr Rhind.—The Bene is cultivated, by me for medicinal uses alone; though at the south its seeds afford an abundance of oil, not inferior to the finest made from the olive. It is called the oil grain. A leaf of this plant, immersed in a tumbler of water, converts it, in a few moments, into a thin mucilage, without taste or color, and is readily taken by children and infants. It is found highly useful in infantile relax and diarrhoea, and in delaying inflammations, of the eye, ear, &c. Albany, July 16. J. BUEL.

NOTE BY THE EDITOR.

We consider the above communication from Judge BUEL, a favor to ourselves and the public. Observations coming from men, who unite theory with practice, are more to be depended upon than the opinions of men, who are acquainted with theory only. From the above, it appears that okra may be cultivated to advantage in this latitude, and from its known reputation in the West Indies, and our southern states, as an article of food during warm weather, we hope our gardeners will be induced to give it a fair trial. A very celebrated dish, called *Gombo*, is prepared in those countries where okra is grown, by mixing with the green pods, ripe tomatoes, and onions; all chopped fine, to which are added pepper and salt, and the whole stewed.

Tomatoes are already cultivated, to considerable extent in this section, and seem almost indi-

genous to the soil, growing with little trouble; but in order to have the benefit of them during the heat of summer, they should be started under glass, and transplanted, when they will ripen their fruit early in August. We have two varieties of them, the yellow and red, growing at this time, with fruit full size, and the quantity produced by a single stalk is surprising. We consider the yellow as best for pickles, but the red, for eating without cooking, and for making catsup. The taste for tomatoes is rather an acquired one, arising from the beneficial effects of eating, and most people become fond of, after eating them a few times.

No less than three varieties of the egg plant are cultivated in the gardens in this vicinity, viz: the large round purple, the long purple, and the round white; the latter variety is considered the most showy, and is more generally cultivated than the other varieties. When started in a hot bed, they produce well. Although they are to be found in many of our gardens, yet they are seldom met with at any of our public, and very few private tables. This is probably owing to our northern cooks not being acquainted with the best method of preparing this fruit, and Judge Buel would confer a favor on ourselves, as well as our readers, by giving directions for cooking, as they will undoubtedly continue to be raised if only for ornament.

From the Northampton Courier.

CULTIVATION OF WHEAT.

MR. ATWELL.—With the improvements which are going forward in various branches of industry, it is desirable that those in agriculture may bear a part. To obtain the full benefit of these, the result of practical experience is necessary; and with this New England may stand preeminent in successful cultivation of her soil. It is too often the case with our agricultural experiments, that if the first does not succeed to our wishes the object is abandoned, when it might easily be attained by a little variation in the process.

The cultivation of *Wheat* has in a great measure been given up by the farmers in this vicinity, and our necessary supplies brought to us from the far distant south and west at no small expense. Could our farmers be made to believe it practicable to raise our own supplies of *Wheat*; many would try the experiment, could they be made to believe it could be raised at a profit, all would desire to engage in the cultivation. From well attested experiments I am satisfied that a little care in relation to the seed and a little more care in the preparation of the soil is all that is required to a successful result in this crop, and that from almost any of the lands in Old Hampshire County. The *white flint Wheat* is better suited to our soil than any other. For several years I have cultivated this grain and have been uniformly successful in the crop. Much has been said of the *flint Wheat* in our agricultural journals. I am inclined to believe it is the same known in Virginia by the name of the *Lancet Wheat*: it took this name from the gentleman who introduced it there, from Pennsylvania, when it was known by the name of the *Jones white Wheat*; I am aware that some have supposed that a distinct kind of wheat from the flint *Wheat* so well known and so much approved in the western counties of N. Y.; attempts have been made to show a difference, but I have seen no evidence which satisfies me that any substantial difference exists between

them: some of the evidence that they are the same arises from these facts: both are natives of Spain, brought to the U. States about the same time (as early as 1814,) and first cultivated in N. Jersey; both resist the Hessian fly and the variations of the season alike, are similar in their appearance, both in the seed and in the field. Be this as it may, whether they are the same or different grains, the flint wheat which I have cultivated possesses the excellence of resisting the insect so often fatal to the *Wheat* crop: it is not so liable to winter killing, better suited to our seasons, less liable to gather rust or shrunk, than any other wheat within my knowledge, and the quantity of flour is full equal and quality superior to other wheat. Many things have been published of this grain which the practical farmer may not find to be correct. It has been said it did not require so strong a soil as other wheat, that less seed was required—that it spread on the ground much more than other *Wheat*, and takes a greater growth; these qualities I have not discovered. It has been said that the stalk is solid and that has been given as a reason for its resisting the insect; but the stalk is not solid; a solid *Wheat* stalk, I apprehend, would be an anomaly in this part of the country; but that there is more substance and less cavity in the stalk than in other wheat is true, and that it is altogether more sure in its rewards to the cultivator than any other wheat, I am fully satisfied. My practice is to soak the seed twenty-four hours, in strong brine (before sowing) and roll it in lime; when this mode has been adopted in preparing the seed, I have never found a head of smut among my *Wheat*.

The benefit in the use of lime on *Wheat* as a remedy against smut has been fully shown by numerous experiments which have uniformly proved effectual, the result of which is before the public; the mere statement of a single one, will show what they are; this is taken from *Young's Annals*; it has been copied into other publications; several distinct and equal portions of very smutty *Wheat* were sown; the first with no application to it produced 377 smutty ears, the second washed in pure water produced 325 smutty ears, the third washed in lime water produced 43 smutty ears, the fourth steeped in lime water 4 hours produced 12 smutty ears, the fifth soaked in lime water 12 hours, produced 6 smutty ears, and the sixth soaked in lime water 24 hours had no smut among it; see New England Farmer for August 23, 1823, and Sept. 6, 1823, and for August 18, 1826, and fr in memoirs of the N. York Board of Agriculture, all proving the same effect from the use of lime.—The application of ley from wood ashes, and a wash of arsenic and salt mixture, has a similar effect upon smut as the use of lime.

It has been fully proved that this disease in *Wheat* arises from microscopic grains of black dust which germinate and reproduce themselves; by the application of lime, as the salt mixture, the germinating principle is destroyed. Lime is also useful in supplying a deficiency in our soils for *Wheat* culture; the soils of New England, generally, says Judge Buel, are primitive in their formation, and do not contain all the elements of this valuable grain, and that this defect must be remedied by the application of something containing these elements.' Great difference of opinion exists as to the quantity which should be applied, and no doubt, different soils require different quantities; a very little is useful; with less than a

bushel of lime to the acre, including the preparation of the seed, I have this year raised a good crop, twenty bushels to the acre or more, (judging of what remains in the sheaf by what has been threshed) of excellent Wheat on old plan land, light loam soil, with no particular preparation except the small one of lime and preparation of the seed, as above stated; this crop succeeded to a crop of corn and potatoes, the latter of which I find the best preparative for Wheat, which also succeeds well a clover crop; the soil should be fine, well pulverized, and sufficiently fertile at least to produce fifty bushels of corn to the acre. The *Rial Wheat* should be sown as early as the 20th of September, though I have known the crop to succeed when sown as late as the 10th October. Should this Wheat prove a safe crop against the insect, and against injury by the severity and changes of our climate, it will be a most valuable accession to the crops of New England Farmers; an experiment with it, is well worthy their attention.

M. DOOLITTLE.

Belchertown, August 4, 1831.

From the Genesee Farmer.

HAY MAKING.

In some of the Middle States, it is customary to begin *hay making* when the grass has scarcely dropped its blossoms. This has been the practice of several generations; and though unaided by philosophy, the farmers of those districts had adopted the very plan which seems warranted by the experiments instituted by the Duke of Bedford, and which seem to prove that the greatest quantity of nutritive matter is obtained from the grasses when in flower.* Hay made from early cut grass, moreover, has a brightness and freshness of appearance altogether superior to hay made late in the season.

Yet notwithstanding both theory and appearance are in favor of early hay, my experience is in direct opposition. My horses have always turned from it, whenever an opportunity for such choice was offered, to old rusty hay, cut after harvest when the grass appeared half dry as it stood, and this they have eaten with avidity. A circumstance of this kind is strongly imprinted on my memory. An old kinsman who was a strenuous advocate for making early hay, said to me when I once called on him in sleighing time, 'Go to the barn, there is plenty of hay, and there is none finer or better in the country.' This was said with a slight reference to our former debates on the subject. I went and found hay, cut when the grass was in flower, and which seemed to have preserved all its greenness; yet my horses, though hungry, would not eat it, but the remnants of some from my own barn which had been trodden under foot in the sleigh, was eaten with an evident relish.

It would be gratifying to have some remarks or explanations on this subject. It is certainly a great saving of labor to cut our grass late in the season. Many a ton of hay have we taken in, on the afternoon of the same day in which the grass was cut; while in England, according to Sir John Sinclair, the shortest time in which hay can be made is 4 days, and 5 hay makers are required to take care of the grass cut by one mower.

A FARMER.

*Is *Timothy* (*Phleum pratense*) an exception? I have not the account of those experiments at hand.

From the New York Farmer.

DECEPTION IN FLOWERS.—TRAVELLING FLORISTS.

'The Flower markets of Paris,' says the conductor of the Gardener's Magazine, 'occupies an open area of about two acres, and the stands of the different Florists are almost always kept by the wives or daughters of the growers. We made several purchases here,' says he 'and were amused at the clumsy attempts made to impose upon us by the fair dealers. We were fully prepared for this; and, indeed should have been surprised had these lively and agreeable women acted otherwise.'

Now, like Mr Loudon, I have not the least objections to a lively and agreeable French woman getting the advantage of me occasionally; but I confess my feelings are different when I am cheated by one of my own sex, of whatever nation.

In the month of February or March last you published an advertisement—and printed Catalogues were issued and distributed, purporting that the *Sieur Fay et Comp^e, Jardiniers, Fleuristes et Pépiniéristes* from Paris, and were exhibiting for sale in Fulton-street, a choice collection of Ornamental Shrubs &c, and would remain but for a short period, being, as they stated, on their way to the Island of Cuba.

I confess that the erroneous spelling of a great many botanical names in a catalogue issuing from a scientific establishment in Paris, might have excited my suspicions of imposture: but this is a fault from which even the New York Farmer is not free. Then the numerous varieties continually introduced by cultivation and discovery, made me think it possible that *Sieur Fay* and Co. might possess the *Fiburnum* (Guelder Rose or Snow Ball) producing red, yellow, rose, and variegated flowers.

But when I got among the Roses, I was delighted.—'Like my brother Florist in Bedford-Street, 'I'm dreadful fond of Roses,' and in my simplicity would have purchased a number of the new varieties, had I not been dissuaded by a judicious friend who was present. Besides the *Grande Cuisse de Nymphé*, the color of which is not stated, we had green, blue, brown and flaxen Rose—white with black, and white with yellow stripes—red with black stripes—red with yellow edges—black and brown with white borders, &c, &c. The *Sieur Fay*, if that be his name, when I expressed surprise at such curious varieties, assured me that every one named was true and genuine, for all were grown by himself. But I was particularly attracted by a *Violet Moss Rose*, an engraving of which colored from nature was exhibited to me. You will say that I ought to have known the wood of a Moss Rose at sight, this is true, and my only excuse is, that several of my friends who profess more botanical knowledge than I pretend to do, purchased a number of these Roses, NOT ONE OF WHICH HAS FLOWERED ACCORDING TO ITS LABEL. My hopes and fears are also at an end.

As when a hen in the straw sees with surprise her first chick burst its calyx and waddle forth a duckling—such was my disappointment a few days ago when my first *Violet Moss*, emerged from its shell, a common *Blush Rose*. I blush when I look at it, and give this notice through your Paper that simpletons like the writer may be warned against trading with these travelling nurserymen in future.

After all, I wish to return good for evil; and as your Journal will probably reach the *Sieur Fay* in Havana, would hint to him not to return via New York, for some who dealt with him when here might prove *ugly customers*; after this advice, the least he can do, is to send me a box or two of 'Dos Amigos,' cigars directed to your care, and I promise him that all our future dealings shall be under the *Rose*.

R.

From the Genesee Farmer.

IRRIGATION.

Although I am not opposed to irrigation, when it can be incidentally introduced without great expense, I do not think it at all essential to good husbandry in our northern latitude, nor that its benefits would in any measure compensate for the heavy expenses attending it in other countries. One would suppose that during the present season, and those which have preceded it, we had more occasion for ditches to carry off than to let in water, upon our fields. The globe may be divided into agricultural zones, each of which requires a different system of husbandry. Ours is not the zone of irrigation, but of draining and manuring; where a judicious rotation of crops, and clean husbandry, with the auxiliaries I have named will generally counteravail the evils of drought. Grounds suffer from drought in proportion to their poverty and bad tillage. In central Asia, the northern part of Africa, and tropical America, irrigation is the great source of fertility, and the use of manure is almost wholly dispensed with. In countries lying between these two zones, those of irrigation and of draining and manuring, as in the south of France, Italy, Spain and the southern states, the two systems may be blended with the best effect. The expense of irrigation, in England, is stated by Loudon, to vary from 10s. to 40l. sterling per acre. We are apt to forget the difference in climate, when we recommend to our farmers the practices of Egypt, of Persia, Peru, Chili and Mexico. Some of these countries have no rain during the year, while others are without any from three to six months at a time.

Jlbury, July 16.

J. B.

To Farmers.—A writer in the *Norwich Courier* says—'If grass when mown, is carefully turned every day it will injure very little. The great cause of injury is its laying on the ground through a long spell of rainy weather. If it lay there more than one day it becomes mouldy, and turns black. If carefully turned daily rain or shine, it will not lose color. This is the result of many years' experience.'

To this we have to add a suggestion made to us verbally by an experienced farmer, and we give it nearly in his own words. 'It is often the case that I find it expedient to rake up my hay when not much more than half cured to avoid an approaching rain. It is unfit for the stack or the mow, and by putting it in cock it is but imperfectly preserved, must be sunned again, and the process is one of much labor and delay. But I have lately learnt on the approach of rain, to put up hay but "half made," in the common phrase, and by applying salt, in the proportion of three pecks, or a bushel, to a ton, it keeps well, comes out bright in the spring and is the best hay for working cattle, being heartier than that cured in the ordinary manner.'

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, AUG. 24, 1831.

FARMERS AND FARMERS' DAUGHTERS

We have received and published several articles on the general embarrassment of farmers in consequence of debt, and the propriety of their daughters 'going out to service,' as one of the methods of alleviating or extinguishing the evil complained of. The subject is interesting, and difficult to investigate or allude to without giving offence to 'worth by poverty depressed.' Still as our correspondent 'Oliver' requests our sentiments in regard to domestics, we will not hesitate to give them.

The time has been when 'working men' and of course working women were considered as beings of an inferior caste, mere drudges, ordained to minister to the wants, caprice and luxuries of the better classes in the community. When the feudal system flourished in full vigor, large portions of the human race were vassals, who held *real* or landed property; (the only possessions at that time considered of much value) by a servile tenure, thus described by Blackstone.

'Besides an oath of *fidelity*, or profession of faith to the lord, which was the parent of our oath of allegiance, the vassal or tenant upon investiture did usually *homage* to his lord; openly and humbly kneeling, being ungirt, uncovered, and holding up his hands both together, between those of the lord, who sat before him; and there professing that "he did become his man from that day forth, of life and limb, and earthly honor." And then he received a kiss from his lord.'

At that time lords of all denominations, from 'our sovereign lord the king,' to the lordly but beggarly proprietor of an Irish bog, or an Highland heath looked upon every kind of labor, whether manual or mental as derogatory to the dignity of such flourishing sprigs of nobility. It was thought more consonant to the rules of etiquette for the *well born* to suffer privations from poverty, which would be deemed intolerable by our day laborers than to earn comparative comfort and affluence by the exercise of any useful occupation.

But with all the vices and foibles, which stigmatize the present generation of human bipeds, there is among the reflecting part no disgrace attached to any useful occupation. We generally acknowledge the correctness of the poet's assertion,

'Honor and shame from no condition rise
Act well your part, there all the honor lies.'

And in all cases, where party politics have not misguided public opinion.

'Worth makes the man, the want of it the fellow.'

In this country, every man not involved in debt nor convicted of crime is his *own master*; but it is his duty, and should be esteemed his privilege to render all the *services* in his power to his fellow laborers in the great field of humanity. And, every freeman is an acting partner in the firm of the United States; and has a right to and is in the habit of receiving benefits from the services of its government. And the government is bound by the constitution and laws of the land to protect every individual member of this Company, or Association in the full enjoyment of the rights to life, liberty, property, health and reputation. Andrew Jackson and Levi Lincoln are among the head laborers belonging to this firm, and each of those 'working men' goes out to service whenever he

goes from home on official business. The President of the United States and the Governor of Massachusetts go out to work, and 'we the People' pay them for their labors.

Again, we will suppose the poorest man in Massachusetts receives an indictable injury from our richest citizen. The commonwealth immediately enters into the service of the injured person; and employs certain *hired men*, such as the State's Attorney, the Sheriff, the Grand Jury, the Judges of the Supreme Court &c, &c, to punish the offender and to redress the injury. Indeed all the laudable, if not all the lawful transactions of mankind in civilized communities consist of *services* rendered and received; and those persons are most praiseworthy, who render themselves most *serviceable*.

In these opinions we are not wholly at issue with our correspondent, 'J Farmer,' who says 'I have daughters that I am endeavoring to bring up in industrious habits.—It is my intention that they shall earn a subsistence by such suitable employment for females as may be found upon a farm and about a farm house. To speak plainly I mean that they shall *work for their living*, believing that it is the duty and happiness of every member of this republic to do so.' In these sentiments we fully concur with the writer. But when he says 'I know my own heart, I would sooner, infinitely sooner follow my daughters to the grave than see them "go out to service"'. There are indeed many excellent females who are driven to this necessity, who go through the fiery trial with credit, and maintain a character of unblemished integrity; yet who will venture to describe the distress the anxiety, the sickness of heart, the anguish of a wounded spirit, that the most favored of them are constrained to endure? we respect his feelings, but do not altogether coincide with his opinions. If he can find employment for his daughters at home in which they can be more respectably, profitably and pleasantly occupied than by going out of the domestic circle, let him by all means retain them under the paternal roof. We conceive the observations of the writer in the Christian Examiner are not at all applicable to his case. But there may be young females, daughters of farmers with 'moderate means' who would be more eligibly situated as well as better employed under some other roof than that of their parents. Suppose the parents, or either of them should be addicted to, or verging towards intemperance, or in other ways exposing the members of the household to the contagion of bad example, it would be better to 'go out to service' than to stay at home and be ruined. In short, general rules with regard to this matter, cannot with any propriety, be prescribed, but every case should be governed by the circumstances, with which it is attended.

If the sentiments of 'A Farmer' on this subject should become general, the consequences might be more injurious than on a superficial view, would be apparent. If Farmers' daughters are not allowed to go out to service, Mechanics' daughters may claim the same privilege; and so on as respects all other classes and vocations in society. Where, then in cases of sickness or other real necessity is female 'help' to be procured. Suppose 'A Farmer's' daughters should be married, and leave him and madam for another home; where then when visited by old age or premature infirmity are they to procure female assistance? A young woman by going into a respectable family, to assist in per-

forming the duties incumbent on house keeping is qualifying herself, and putting herself in the way to become the head of a family in her turn.

If farmers' daughters are willing to become farmers' wives, let them not hesitate when occasion requires, to go into the service of other respectable farmers or into any other good, moral, respectable families; and instead of suffering their spirits to be wounded, or feeling chagrin or mortification, let them make themselves as cheerful, useful and agreeable as possible. If however, they can find any proper useful occupations at home, so be it. Whether they keep bees, manufacture silk, or straw bonnets, or best wishes and benedictions attend them. But if they are among the arrows of coquetry at lawyers, merchants, physicians, &c, though we still wish them well, we consider them as without our jurisdiction, and have nothing to say to their ladyships.

We will dismiss this subject which is far from being a pleasant topic for discussion, with one farther remark. We have often seen with regret the daughters of farmers, not in the most flourishing circumstances, who could not condescend to perform the *house work* of their own family. They were too indolent and lady-like to have anything to do with the dairy, the kitchen or the pantry, and would as soon dig in a ditch as wash a few dishes after a family meal. Everything of this kind must be done by *hired help*. Now such farmers' daughters ought to set themselves immediately about the theory and practice of the duties of the *frugal housewife*, or forever be deemed incompetent to form or sustain a matrimonial alliance, with any being except some hero of a novel, existing only in the imagination of some half-crazed spinster of romances.

HAMPSHIRE CATTLE SHOW.

This annual festival of the Yeomanry of Hampshire, Hampden, and Franklin counties, will take place this year on the 26th and 27th of October, two successive days. The variety, number and size of the Premiums offered this year exceed those of last year, and offer great inducements to the enterprising farmers of the three counties; we are glad to observe a goodly number of premiums offered for Horses and Colts, adapted to the Saddle, Harness and Farmers' use; that this class of animals require regeneration and improvement, there can be no question; they are poor and spiritless and deficient in strength and symmetry in this part of the commonwealth to a surprising degree, and it is full time efforts were made to improve them. The raising of Mulberry Trees and Silk Worms is engaging the attention of the society, and liberal premiums are offered for such plantations; much soil in the three counties is fitted for no other purpose than the growth of the Mulberry Tree, and the whole attention and culture of Silk Worms can be performed by those whose age and sex unfit them for fatiguing and laborious duties; we hope the raising of Silk Worms will be considered and valued in its proper light by our enterprising farmers.—*Northampton Courier*.

TO CORRESPONDENTS.—We are obliged to defer many articles this week, among which are two from our able correspondent, Gen. Dearborn—one from Dedham, on Budding—Prospectus of a proposed Botanical Magazine, by Messrs D. & C. Landreth, of Philadelphia. We have received several communications on the subject of Farmers' Daughters.

Plum and Cherry Stones Wanted.

A liberal price will be paid by the subscriber for one bushel of Plum Stones and two or three pecks of Cherry Stones, to be warrantable of the growth of 1831.

Aug. 21. 4t J. B. RUSSELL.

Perry.

For sale at the Agricultural Warehouse, No. 52 North Market Street—
A few dozen bottles of excellent Perry, of fine flavor and sprightly, well packed, and wired and sealed in champagne bottles. Price \$3 per dozen. Aug. 17.

Roses, Dahlias, Strawberries and Quicks.

The proprietors of the Albany Nursery have printed a classification of 140 of their finest Roses, according to color, to enable purchasers to select a variety with certainty and economy, with characters indicating the size of the flower, habit and prices. This may be seen at the office of the New England Farmer.

They have imported and propagated many varieties of the finest double Dahlias, which may be selected by the flowers until the frosts of autumn.

They will have for sale, from this time forward, plants of the Methven Strawberry, at \$2.50 per hundred.—Fortyseven of these berries have weighed a pound, and some have measured $\frac{1}{2}$ inches round. Also many other varieties, for which see catalogue.

They have also for sale, at \$5 per thousand, 50,000 quicks of the honey locust (*Gleditsia triacanthus*) for live fences, two years old, and fit for transplanting.—Specimens of the force may be seen at the Nursery.

Orders for any of the above, or for trees, shrubs and plants, may be sent by mail, or left with J. B. Russell.

Albany Nursery, July 16, 1831.

Aug. 10. 3t

Zinc Milk Pans.

For sale at the Agricultural Warehouse—Westfield's patent Zinc Milk Pans. A particular account of this great improvement in dairymaking will be found in the New England Farmer for July 6, 1831, page 405, and many other journals. Milk in these pans will keep sweet longer than in those of other materials, and thus consequently afford a longer time for the cream to rise, and produce one sixth more butter, as has been proved, of the sweetest quality. The pans are very durable, and not likely to rust.

NOTICE.

The undersigned being owner of the Letters patent for the manufactory of the above article, hereby cautions the Public from trespassing on his patent right, as they would avoid the penalty of the law; and also gives notice that he has appointed J. R. Newell, proprietor of the Agricultural Warehouse in the city of Boston, his Agent for vending the above articles.

Aug. 3. CHARLES BISHOP.

Bees.

The Subscriber has 300 swarms of Bees for sale, in his Patent Slide Beehives, at 20 cents per pound, weight of each swarm from 40 to 100 lbs. tare of hive deducted; the price of the Patent Hives is \$2 a piece, and the price of a single right \$5.

Also for sale, 200 swarms of bees in the old fashioned hive, price 17 cents per pound, tare of hive deducted.

The above will be delivered within fifty miles of Boston, in good order, (warranted free from moths or otherwise damaged) by the first day of March, 1832.

All letters must be sent in before the first day of September, 1831, post paid, to the subscriber, at Brighton, Mass. so as to have time to transport them from Maine.

N. B. The weight of the above hives will be taken in September.

July 6 EBENEZER BEARD.

ep2m

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Aug. 3.

Wanted,

A situation for a boy 12 years of age, in the country, as an apprentice to a farmer, or any good mechanical trade. For further particulars inquire of T. T. ROBERTS, No. 5 Union street.

2t

Aug. 24.

Nathaniel Dearborn

Respectfully informs his friends and the public, that he has removed his place of business, from State street to No. 110 Washington street, in the front lower chambers over Messrs Hilliard, Gray & Co.'s bookstore—where orders are solicited for engraving in all its varieties.

Copperplate Printing neatly accomplished.
[?] Flat Tintion, by the new system of Instruction.
Perspective Drawings made of Machinery, Inventions, &c.
6w Aug. 21.

Black Currant Wine.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A further supply of superior old Black Currant Wine, made under the inspection of John Prince, Esq. Roxbury; an account of its astringent and detergent properties in various complaints, will be found in the N. E. Farmer, vol. 5, page 267, written by S. W. Pomeroy, Esq. and the late Doct. J. G. Coffin. It is highly salutary in many summer complaints. Doct. Coffin states: 'Its use has been attended with remarkable success in the early stages of cholera morbus and dysentery—and again also in the later stages of these diseases, after the symptoms of inflammation or febrile excitement had ceased.' It has been strikingly remedial in the low states of typhoid and bilious fever. The late Capt. Gilchrist, who for several years followed the Batavia trade, and who had always suffered an attack of the severe cholera which proves so destructive of human life in that climate, used to say that after he had this wine with him, and took two glasses of it every morning, he escaped the disease. On one voyage, his mate, who had not taken the wine, was seized with this complaint, when a bottle or two stopped its progress. We have not room to enumerate many other morbid affections in which this wine has proved useful. In sore throat it has for a number of years been considered almost a specific remedy.—Price 75 cts. per bottle.

Aug. 3.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention.

EBENEZER WIGHT,
46, Milk street, opposite Federal-st., Apothecary.

Seeds for Fall Sowing.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

Garden and Field Seeds, suitable for fall sowing, among which are—

WHITE PORTUGAL ONION.
PRICKLY SPINACH, (for early greens.)
BLACK SPANISH or WINTER RADISH
LONG DUTCH PARSNIP, and a variety of other garden seeds.

Also—TIMOTHY or HERDS GRASS—ORCHARD GRASS—RED TOP, RED and WHITE CLOVER, &c. &c.
Aug. 3.

Of the best quality and at lowest prices, for sporting—constantly for sale at COPLAND'S POWDER STORE, 61 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded if Jan.

Dole's Hybrid Turnip Seed.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A few packages of seed of this new variety of turnip, so highly esteemed in Scotland, and which is described in No. 3, vol. x. N. E. Farmer.—Price 12½ cts. each paper.

Turnip Seed.

For sale at the Seed Store connected with the New England Farmer, No. 52 North Market Street, Boston.
200 lbs. White Flat Turnip Seed, the growth of the present season, raised in this vicinity expressly for this Establishment.

Also—Ruta Baga of the very first quality, of both American and European growth; Yellow Aberdeen, Yellow Stone, White Norfolk Field, and Yellow French Turnips; Long Prickly and other Cucumbers, for pickling, warranted genuine and fresh.

July 6

A Gardener.

A Gardener, with good recommendations, recently from Scotland, wants a situation. Inquire at the N. E. Farmer Office.

4w

Aug. 24.

Tulip Roots.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A splendid collection of Tulip Roots, now in fine order for re-planting, comprising some of the most beautiful varieties now cultivated in this vicinity, viz:

Marbled or mottled, dark stamens.
White and Purple, ditto.
Yellow and Purple, ditto.
Double Yellow Rose.
Double pale yellow flamed, (Passe non plus ultra.)
Crimson, yellow centre and yellow stamens.
White, shaded with red, dark centre and stamens.
Fine large yellow, with yellow stamens.
Double white, with red shades, (beautiful.)
Double orange brown, (very large.)
Double prunny rose.
Double coffee color.
Pacrot tulips, of several colors.
Fine bilboons, (striped on white ground.)
Fine bizzars, (striped on yellow ground.)
Fine Rosy, on white, &c. &c. Price 12½ cts. each—\$1 per doz.

The above are of large size, and are raised from superior imported roots, some of which cost \$1 each.

Also, common tulip roots, of all colors, and of good size, price \$5 per hundred, suitable for those commencing a large tulip bed.

Also, Double White and Yellow sweet scented Narcissus—124 cts. each—\$1 per doz.

Mixed Crocus roots—50 cts. per dozen. Aug. 3.

30 Dollars Reward.

The above reward will be paid by the Subscriber for the detection and conviction of the vile wretch or wretches who have been brave enough to break down a large number of young rock maple Trees, set out on the road adjoining his Farm, leading from Dedham turnpike to Brushhill turnpike, for the purpose of shade and ornament. As the vile wretch who could be guilty of such a crime is dangerous to the community, it is hoped that the citizens of Roxbury and Dorchester will be vigilant in endeavoring to detect him, in order that he may be brought to public justice. JEREMIAH HILL.

Boston, July, 1831.

July 20.

BRIGHTON MARKET.—Monday, Aug. 22.

[Reported for the Chronicle and Patriot.]

At Market this day 541 Beef Cattle, including about 150 unsold last week; 485 Stores; 20 Cows and Calves; 3227 Sheep and Lambs, and 464 Swine. About 50 Beef Cattle remain unsold, all of which are thin Cattle.

PRICES.—Beef Cattle—The best qualities of Cattle were rather scarce and a little better prices were obtained. We quote for prime 5 a 5 25, good 4 25 a 4 75, thin 3 50 a 4.

Stores—Few sales only were effected.

Cows and Calves—All at market were ordinary. We noticed sales at \$15, 17, 18, 20, and 23.

Sheep and Lambs—We noticed sales at \$1 75, 1 84, 1 88, 1 92, 2 12½, 2 17, 2 25 and 2 37½; a few wethers were sold, price not known.

Swine—Rather dull, at retail 4½ for Sows and 5½ for Barrows—not much demand for lots.

Erratum.—In our last week's report for good Cattle it should have been 4 25 a 4 75 instead of 4 25 a 4 15 as published.

New York Cattle Market, Aug 13.—At market 600 to 700 Beef Cattle. 2500 to 3000 Sheep and Lambs; a large portion were inferior. Several small lots extra, \$6 50, a 6 75, a few favorite cattle \$7, good \$5 75 a 6; fair \$5 25 a 5 50; ordinary 4 50 a 4 75 and \$5 per cwt. Sheep—Demand good at \$ 1 25 to 4 each; few extra \$1; good, 2 50 to \$3; fair 2 to 2 25; middling, 1 50 to 1 75. Lambs 2 75 extra, good 2 to 2 25, fair 1 50 a 1 75, and ordinary 1 00 a 1 25. Swine, small hand-some shoats, from 4 to 4½. Grown hogs, 3½ a 3¾. Milch Cows more in demand this week, but very little advance in price. Sales at \$18, \$23, \$25, \$30, and \$33. Notwithstanding the heat of the weather has produced some little heaviness in the Beef market, yet there is no considerable glut—for sheep and lambs the market is open, and there is no Swine on hand.—Journal of Commerce.

MISCELLANY.

AN AMERICAN PIGEON ROOST.

It was in a portion of the forest where the trees were of great magnitude, and where there was little underwood; I rode through it upwards of forty miles, and crossing it in different parts, found its average breadth to be rather more than three miles. My first view of it was about a fortnight subsequent to the period when the pigeons first made choice of it, and I arrived there nearly two hours before sunset. Few pigeons were then to be seen, but a great number of persons, with horses and wagons, guns and ammunition, had already established encampments on the borders. Two farmers from the vicinity of Russellville, distant more than one hundred miles, had driven upwards of three hundred hogs, to be fattened on the pigeons which were to be slaughtered. Here and there, the people employed in plucking and salting what had already been procured, were seen sitting in the midst of large piles of these birds. The dung lay several inches deep, covering the whole extent of the roosting place, like a bed of snow. Many trees two feet in diameter, I observed, were broken off at no great distance from the ground, and the branches of many of the largest and tallest had given way, as if the forest had been swept by a tornado. Everything proved to me that the number of birds resorting to this part of the forest must be immense beyond conception. As the period of their arrival approached, their faces anxiously prepared to receive them. Some were furnished with iron pots containing sulphur, others with torches of pine knots, many with poles, and the rest with guns. The sun was lost to our view, yet not a pigeon had arrived. Everything was ready, and all eyes were gazing upon the clear sky, which appeared in glimpses amidst the tall trees. Suddenly there burst forth a general cry of 'Here they come.' The noise which they made, though yet distant, reminded me of a hard gale at sea, passing through the rigging of a close-reefed vessel. As the birds arrived and passed over me, I felt a current of air that surprised me. Thousands were soon knocked down by the pole-men. The birds continued to pour in, the fires were lighted, and a magnificent, as well as wonderful and almost terrifying sight presented itself. The pigeons, arriving by thousands, alighted every where, one above another, until solid masses as large as hogs-heads were formed on the branches all around. Here and there the perches gave way under the weight with a crash, and falling to the ground, destroyed hundreds of the birds beneath, forcing down the dense groups with which every stick was loaded. It was a scene of uproar and confusion. I found it quite useless to speak, or even to shout to those persons who were nearest to me. Even the reports of the gun were seldom heard, and I was made aware of the firing only by seeing the shooters reloading. No one dare venture within the line of devastation. The hogs had been penned up in due time, the picking up of the dead and wounded being left for the next morning's employment. The pigeons were constantly coming, and it was past midnight before I perceived a decrease in the numbers of those arrived. The uproar continued the whole night; and as I was anxious to know to what distance the sound reached, I sent off a man, accustomed to perambulate the forest, who returning two hours afterwards, informed me he had heard it three miles distant from the spot. Towards the approach of day the noise in some measure subsided, and long before objects were distinguishable, the pigeons began to move off in a direction quite different from that in which they had arrived the evening before, and at sunrise, all that were able to fly had disappeared. The howlings of the wolves now reached our ears, and the foxes, lynxes, congars, bears, raccoons, opossums, and polecats, were seen sneaking off; whilst eagles and hawks of different species, accompanied by a crowd of vultures, came to supplant them, and enjoy their share of the spoil.—*Judubon's Ornithological Biography.*

Vocations.—A short time since, some gentlemen were enjoying the diversion of coursing, and having lost sight of the hare, one of the party hastily rode up to a boy, when the following dialogue ensued:—'Boy, have you seen a hare running this way, followed by dogs.' *Answer*—'W-w-w-w-what, do you mean a l-l-little b-b-brown thing?—Yes.—Had it l-l-long ears?—Yes.—A l-l-little white under the b-b-belly?—Yes.—Had it a s-s-s-short tail?—Yes.—A-a-a-and l-l-long legs?—Yes.—Was it r-r-r-running as f-f-fast as it could?—Yes it was. *Boy*—(calmly, after a pause) No; I have not seen it.

'Praise your honor, is a thing lost when you know where it is?' said an Irish footman to his master.—'To be sure not, you boobey.' 'Och! thank your honor for that—the devil a harm then,' said Pat.—'for the new copper t-kettle's at the bottom of the well.'

Spelling.—The New York Evening Journal says, there is a small shop not far from Grand street in that city, the windows of which are garnished with little bunches of herbs, and strings of dried roots, bearing labels like the following: 'cure for dyspepsy'—cure for *scruffolis* complaints—cure for fever and ager—for *jaunders*, and *weak joints*—cure for information in the eyes, &c.

This is not quite so bad as the orthography of a good man and his spouse in the West of England, who in order to let their neighbors know that they cured those afflicted with agues as well as the jaundice, hung out a sign on which was inscribed 'I cures a goose and my wife cures the ganders.'

A number of sailors were dining together at a boarding-house in Havana, when one, an eccentric Yankee, hastily arose from the table—and in a threatening posture flourishing his knife, bawled out, 'Who dares to say that he don't love roast beef?' 'I dare say so,' cried an Englishman, who arose at the opposite side of the table. 'Well,' said Jonathan, coolly taking his seat, 'Then you may eat nutton?'

Sale of a Wife.—At one of those disgraceful exhibitions—the sale of a wife by her husband—which took place in Manchester some time since, the husband officiated as auctioneer for disposing of his worthless rib. 'Wholl' buy a wife,' said he; 'a fine wife, a handsome wife?' 'And say a good wife,' whispered she. 'No, no,' rejoined the husband, 'I won't cheat them.'

Dry Humor.—An Irish post boy having driven a gentleman a long stage during torrents of rain, the gentleman civilly said to Paddy, 'Are you not very wet?' 'Arrah! I don't care about being very wet, but please your honor, I'm very dry.'

Love of Dress.—Man is in no haste to be venerable. At present it seems as if there were no occasion to become so. People die as usual, but it is not the fashion to grow old. Formerly, men subsided, and settled down into a respectable old age at forty, as they did into a hobbwig, and a brown coat and waistcoat of a certain cut.—The father of a family no longer pretended to pass for a gay young fellow, after he had children grown up; and women dwindled by ready and willing gradations into mothers and grandmothers, transferring their charms and pretensions to a blooming posterity; but these things are never thought of now-a-days. A matron of sixty flouts it in 'La Belle Assemblée's' dresses for May'; and certainly M. Stultz never inquires into the grand climacteric of his customers. Dress levels all ages as well as all ranks.—*Whittaker's Monthly Magazine.*

Good Recruiting.—A sergeant who was recruiting in Leicestershire, told his Captain he had got him an extraordinary recruit. 'Aye!' said the Captain, 'what is he?' 'A butcher, Sir,' replies the sergeant, 'and you'll find him very useful, for we have enlisted two sheep-stealers in the company, before him.'

A talkative barber asked his customer how he wished his beard to be cut.—'Without saying a word,' replied he.

Medical School in Boston.

The Medical Lectures of Harvard University delivered in Boston will be commenced in the Autumn, at the usual period, viz. on the third Wednesday in October. They will be continued four months.

This extension in the term of the Lectures has been thought necessary to afford time for such a course of instruction and demonstration, as is deemed by the Faculty to be requisite, under the advantages which have recently accrued to the School.

The Legislature of Massachusetts, with an enlightened liberality, which owes honor to our age and country, have extended the protection of law to the cultivation of Anatomy within this Commonwealth. The advantage which will hence result to students resorting to this school will be sufficiently obvious. It will be the aim of the Professors to carry into effect the intentions of the Legislature, in such a manner as to evince at the same time their respect for the rights of humanity, and their interest in the promotion of the healing art.

The opportunities for practical instruction at the Massachusetts General Hospital continue undiminished.

The course of Lectures will be—
On Anatomy and Surgery, by Dr Warren.
" Chemistry, by Dr Webster.
" Materia Medica, by Dr Bigelow.
" Obstetrics and Medical Jurisprudence, by Dr Channing.
" Theory and Practice of Physic and on Clinical Medicine, by Dr Jackson.

WALTER CHANNING,
Dean of the Faculty of Medicine,
Boston, June 15, 1831. 61 July 16

Lynn Mineral Spring Hotel,

Two miles from Boston, Six from Salem, and Five from Nahant. The subscriber most respectfully begs leave to inform his friends and the public that he continues to keep that delightful summer retreat, the Lynn Mineral Spring Hotel, which it will be his object to render a genteel and pleasant resort for Boarders, Parties of Pleasure, transient Visitors, &c.

The salubrious qualities of the waters of this celebrated Spring—the beautiful lake, on the borders of which the establishment is situated, abounding with fish of various descriptions, and surrounded with the most wild and romantic scenery—splendid Boats for sailing or fishing—Bathing rooms on the margin of the lake, where the warm or cold bath may at any time be taken—the delightful situation of the House, with its comfortable and well furnished apartments, with the fruit and flower Gardens adjoining, are attractions for those in pursuit of health or pleasure, rarely excelled if equalled in any part of the country.

Every exertion shall be made to merit a continuance of that patronage which has been so liberally bestowed. July 20. JAMES W. BARTON.

Cocoons Wanted.

The Subscriber will pay cash for Cocoons, from 25 to 50 cents, according to quality. J. H. COBB.
Dedham, July 15th, 1831. 81 July 20.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer's office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

If no paper will be sent to a distance without payment being made in advance.

Horticulture.

Proceedings of the Massachusetts Horticultural Society at a meeting, held at the Hall of the Institution, on Saturday the 27th of Aug. 1831.

The President, H. A. S. Dearborn, made the following report.

The annexed letters have been received from Doct. J. B. Van Mons of Lovain, in Belgium, the most successful and distinguished cultivator of new varieties of fruits, and especially Pears, in modern times. A large portion of his life has been devoted to this highly interesting and useful pursuit, and the gardens of Europe and this country are embellished with the magnificent products of his industry and science. He has not only announced a novel theory for obtaining ameliorated fruits, but has so skillfully applied it in his own celebrated gardens that his name has become illustrious, among the horticulturists of all nations. His liberality towards this society merits our gratitude, while his assurances of continued favors, cannot fail of being eminently beneficial to its members, individually, as well as to the whole country.

LOVAIN, FEB. 25, 1831.

Sir—At the time (20th of Feb.) I transmitted to you a bundle of scions, I was excluded from my large garden, in consequence of its being inundated. I therefore could include in the package only such varieties as were to be found in my two other gardens; but as my principal garden is now almost free from water, I have made up a second bundle, composed, as was the first, of such varieties as I possess, of the greatest merit and of very recent production. I add a variety of 1830, which, after having been pronounced exquisite, by amateurs, I have designated with your name. The trees in my garden have run a great risk of being cut down, to be used in the construction of barricades. I should have been consoled by the motive which induced such a noble employment of them. The hands of the ladies were armed with the axes for effecting their destruction, the men were called in to battle. But why should I have murmured at an event, produced under such peculiar circumstances. My labour of thirtyeight years might have been lost, but it would have contributed to enable me to die a FREE CITIZEN. Still I should have experienced regret, in not having it in my power to offer you scions, from the trees which would have been destroyed.

The package may not reach you for some time, but let not that induce you to doubt of success in using the grafts which it contains. I should remind you, that some scions, which were sent me from New York, by my elevè Gerard, were two years and a half on the way, still I grafted them, by copulation, upon adult trees one on each branch, and not any of them failed. It was in the middle of September. A scion is never too old, or rather too dry, not to succeed, provided it has been cut from a living tree, or from one that has not perished by a natural death. Artificial death, such as that occasioned by deplantation, does not injure, in the least, the excellence of the scion.

The suppression of the faculty of physical sciences and mathematics, in our university has put an end to my lectures on Chemistry and Horticulture.

I have been transferred to the faculty of medicine.

I send you a few engravings of my *Pomographie Belgique Moderne*. This work appears in the *Revue des Revues*, but as it is published in distinct parts, you shall be furnished with a complete copy, when it is more advanced.

I pray you, sir, to be assured of my very high esteem.

HENRY A. S. DEARBORN,
Pres. of the Mass. Hort. Soc.

J. B. VAN MONS.

LOVAIN, MARCH 20, 1831.

Sir—The bundle of scions was packed up when I received from Mr Barnett, the consul of your Republic in Paris, information, that he held subject to my order, the Diploma of Honorary member of the Massachusetts Horticultural Society.

I pray you to be the organ, to express my grateful acknowledgments, to the illustrious Society over which you preside, for the honorable and distinguished manner in which it has been pleased to notice me, and to accept my sincere thanks for the active part you have taken in my behalf.

I have the honor to be, sir, your very humble and obedient servant and fellow member.

HENRY A. S. DEARBORN,
Pres. of the Mass. Hort. Soc.

J. B. VAN MONS.

Also—No. 541—608, 609, 757, 887, 896 of his catalogue being choice unnamed varieties.

The engravings of the pears which were presented by Doct. Van Mons, represent the following varieties.

Vicomte-De-Spoelberch
Henri-Van Mons.
Innommée.
Bezy Vaet.
Serrurier D'Automne.
Beurre Spence.
Delices D'Hardenpont.
Brandes (Saint Germain)
Frederic-De-Wurtemberg,
Fondante-Des-Bois.
Beurre Curtet
Beurre D'Arenberg, formerly called Colmar-Des-Champs
Beurre Des Orphelins and Beurre D'Hardenpont.
Colmar Bonnet.
Leon Laclere.

The engravings have been put into a portfolio and placed in the Library of the Society.

The portion of the *Revue Des Revues*, in which are included detached parts of Doct. Van Mons *Pomographie Belgique Moderne*, furnishes the following descriptions of the four first named pears.

VICOMTE DE SPOELBERCH.

By J. B. Van Mons.

Pyrus spoelberchia (Vice comes) sativa, fructu magno, subrotundo, rugoso, rubro-fusco ad solem striis purpureis adfecto parte soli adversa, maculis satore viridibus distincto, carne butyracea, suavolente, dulcissima, spidissima; brumali.

The branches of the Vicomte de Spoelberch grow erect, and are bent towards the stock. The annual shoots are small without being slim, and are wrinkled and contorted. They incline at the end towards the branch which bears them. They are brown and finely speckled with dirty white. The two years' old wood loses its wrinkles, or ridges, and is covered with a gray epidermis; the freckles then become very prominent and more apparent and this prominence of the dots increases in proportion as the wood advances in age. The tree does not bear a single thorn and I doubt whether it ever produced any.

The leaves are elongate, narrower at the outer end, than towards the petiole, irregularly indented, smooth, thick, dark green and borne on a slender petiole; on the annual shoots they are variously wrinkled, or folded, the shoots are hairy, contorted and of a pale bluish green; the flower is of a medium size, petals firm, coriiform, interrupted and hollowed like the bowl of a spoon.

The fruit varies in size according to the greater or less quantity produced. Its form would be spherical, if it was not swelled out and flattened towards the eye, and contracted near the stem. The skin is rough, of a brownish red on the side towards the sun, spotted with purple, and on the opposite side it is of a deep green. The spots, are rather blotches than dots. The eye is small, and but little sunk, only sufficiently deep to protect the leaves of the calyx. The peduncle laterally inserted, is placed in a cavity, but slightly hollowed. It is swelled out near the middle and the largest diameter is from the stem to the calyx. The seeds are five, black, plump, and closely pressed in their cells.

The flesh is buttery, saccharine, full of agreeable and sprightly juice, and very high flavored. It is decidedly a winter fruit and sometimes keeps until spring, notwithstanding the thickness and hardness of the skin, as is generally the case with late pears. It readily contracts the odour of the place where it is kept.

The first fruit produced by the Spoelberch tree was very large, green, elongated, smooth, and had a form intermediate between the *B. urr. gris* and the *Bezy de Chaumontel*. Its resemblance to this last, induced me to name it *Bezy de Spoelberch*. The fruit of the second crop was tolerably changed in form and color, assuming the character under which it has been described.

I have bestowed upon this excellent pear the name of *Vicomte de Spoelberch*, a member of the Botanical and Agricultural Society of this city, and one of the trustees of our University.

HENRI-VAN-MONS.

By J. B. Van Mons.

Pyrus monia (Henricus) sativa, fructu maximo, prope cylindrico, glabro, flavo-viridi; maculis ferrugineis distincto, ad solem parce rubente, acido-dulce, in ore liquescente, autumnali.

The tree of Henri-Van-Mons is, without contradiction, among a great number of varieties of its species, which I possess, that which in the whole appearance of its form, presents the most singular characteristics. It is very full of branches, which are circumscribed in their extent, and shoot in all directions, without producing confusion or shading the centre. The annual shoots are short, large, round, smooth, brownish red when without down, and lead bronze when covered with a bluish down. They are covered with numerous small round whitish spots, bent at the joints and crooked between them. There results from this an irregular zig-zag which contributes not a little to give the tree the unusual aspect which has been mentioned.

I do not recollect having discovered any spines upon this tree. It appears from its manner of vegetating to the sub-species which has produced the *Messire Jean* and the *Sanguines*, (the ancient and those I have recently produced). But the resemblance only exists in the wood.

The leaf of the Henri-Van-Mons, is long, rounded towards the outer end and narrowed at the outer extremity, and is supported by a long and stout petiole. The sides are often folded towards the base; and when the centre is not arched on the underside, the borders are folded above, the lateral nerves are very conspicuous; it is smooth and of a deep green.

The new shoots are of a bluish gray, long, contorted, and covered with a gray down.

The flower is of a medium size. The petals are sufficiently distant from each other and folded towards the top, without being hollowed like a spoon. The lower ends are stained with a delicate rose color.

The fruit is very large. The engraving was made from a specimen not of the largest size; it is contracted in proportion to its length and is swelled out, about a third of its height; but the largest fruit often assumes a cylindrical form. The eye is small and placed in a narrow cavity bordered by small knobs and wrinkles, which seem to have produced the cicatrice of an incision of the eye and the border which surrounds it; this characteristic prevails in all the pears. The peduncle which is larger next to the fruit than at the point of

connexion with the branch, is more than of a medium length. It is placed in a large and deep cavity. The skin is smooth, of a yellowish green marked with reddish brown, sprinkled with red dots and slightly stained with red on the side next the sun. The flesh is tender, buttery, sweet, slightly mingled with acid, which renders it very agreeable. The skin becomes yellowish as it approaches maturity and assumes a more brilliant red. It is an excellent autumnal fruit and its true pear flavor should make it in great demand.

I have done homage to M. Henri Van Mons, my relative and a merchant of Bruxelles, by bestowing his name on this new pear.

INNOUMEE.

By J. B. Van Mons.

Pyrus innoumata, sativa, fructu maximo, pyriformi-acuto, oblongo, glabrescente, viridi, maturo flavescente, ore liquescente, saccharo divite, acido-autumnali.

I describe the *Innoumee*, from the parent tree, which, since its birth, has been freely exposed and left to its natural propensities.

At first the branches were oblique, but soon, without being depressed by the weight of the fruit, they bent down as if they had been broken, and assumed a horizontal direction. The distance from the stock where the bend commences is the same in all the branches.

The leaf is narrow and terminates in a point at both extremities, it is pale green, and wrinkled in grooves. The principal nerve, with its petiole of a medium length, describes a curved line. The figured leaf appertained to a bud, of which no trace is to be discovered and remains upon the branch from above which the fruit with its support has been detached. The borders of the leaf are scarcely denticulated. The secondary nerves are scarcely perceptible.

Flower ample and the petal round, of a remarkable whiteness, which is strongly relieved by the deep brown of the stamens.

The fruit is very large; it resembles a pear which I have received from France under the name of *Poire des Jardins*, which is not the *Hofpeer* of this country, and from the contraction of the short neck, the *Frederick de Wurtemberg*, which will soon be described. It has a decided pear form, rounded at the summit, swelled out in the middle and terminated in an obtuse point, where a portion of the flesh is elevated and covers partially, the peduncle, while on the opposite side it is depressed; this peduncle is long, large and straight. The skin is of a clear green, spotted and marbled with pale brown, and becomes yellowish in some parts at the time the fruit is maturely ripe.

The flesh is delicate, melting, saccharine, and improved by an agreeable perfume. Although between a summer and autumn fruit, it has not the least disposition to become mealy and but little to grow soft, and having past the time of its maturity, it dissolves into a jelly.

BEZY-VAET.

By J. B. Van Mons.

Pyrus Bezy-Vaastia, sativa, fructu magno, turbinato, ad basin et apicem compresso, ventricosco, punctulis rufescentibus et maculis rufis abducto, saturo viridi, ad solem purpureo, subrugoso, spisse saccharino, sapido, suaveolente, butyraceo, brumali.

The *Bezy Vaet*, according to tradition and from the name which it bears, was probably obtained by the late abbe Saint Vaast, or had been dissemina-

ted by him; for being unknown, at least by this name, in France, it was under that of *Bezy*, (*savage*, or *wild*), de Saint Vaast, that it was cultivated in Austrian Hainaut, at Engbien, Mons and elsewhere. I have no information as to the age of this variety, and it is only from one of its grafts that I can describe it. This graft, from design, has never been pruned, from the time of its insertion.

The *Vaet* bears its wood erect, and its branches are naturally disposed à *quennille*,* the wood is long, moderately stout and out of proportion to the vigor of the stalk. Upon the annual shoots the bark is brownish-red and sprinkled with small round dots; upon the two years old wood, it is a deep brown; the spots are enlarged without changing their form. Upon more aged wood, the brown changes to red, and the spots become mottled, assuming a silvery aspect.

The leaf of the *Vaet* is large and rounded next to the petiole, which is long and slim, and red when it first appears; it is arched on the under side, thick and deeply serrated on its borders; its color is an obscure green.

The fruit, from all its exterior characteristics, seems to belong to the sub-species of *Roussclefs*, varying, however, in color, the ground being deep green, blotched with purple, and the stains in spots of rusty-red. Its size and form are those of the very welcome *Colmar*. The eye is only sufficiently deep to receive the leaves of the calyx and is surrounded with protuberances and wrinkles. The peduncle is short for the size of the fruit, not very large, ligneous, and cut, at its extremity, in the form of a cloven or deer's foot; it is perpendicularly inserted in the centre of a large hollow, which is surrounded by a large rounded ridge.

This peduncle adheres with a half solution of the continuity to the ligneous fruit support, and which, if it were not for the leaves that surround it, might be taken for the prolongation of the stem of the fruit.

The flesh is both melting and buttery, and when the fruit is perfectly ripe it assumes a slight yellow tint; it abounds in sugar, and exhales a perfume, which cannot be compared to the aroma of any other fruit. The period of its maturity is December and January; it can be prolonged by gathering the fruit fifteen days sooner than the usual time of harvest, which, however extraordinary for such a late species, it bears very well.

After what has been said of the *Vaet*, it is superfluous to add, that it is worthy of being favorably received by amateurs.

The following notice of the *Beurre Spense* and the *Serrurier-D'Autonne* is extracted from the *Annales D'Horticulture*.

Mr Van Mons has published with engravings, in the *Revue des Reves*, for March, 1830, two new pears which appear to be of an excellent quality and to merit a distinguished place in our gardens. One is called *Beurre Spense*, from the name of an honorable member of the London Horticultural Society, and the other *Serrurier D'Autonne*, dedicated to M. Serrurier, a member of the Institute Royal de Hollande and author of a *Dictionnaire de fructologie*. These two pears have melting and delicious flesh; the first ripens the last of September and the second, the end of October.

The scions have been preserved and are at the * A mode of pruning which gives to the tree the form of a distaff—common in Holland and France.

disposition of the Society. The astonishing experiment which Doct. Van Mons states he has made, with scions two years and a half old, warrants a repetition, with those he has so kindly transmitted. They should be soaked, no doubt, in soft water, before they are engrafted. The grafting by *Copulation*, is only performed on young stalks or the shoots of trees which are of the size of the scions, and is a kind of *splice*.—The scion and stalk, or branch, being each cut half through about an inch from the ends and the piece split off so that the remaining parts being reversed occupy the spaces thus left and make a secure joint; or each may be cut off sloping, about an inch and united, so that the parts are in contact to the extent of the slope. They are to be secured by bandages like buds. Engravings of the mode of grafting may be seen in the 7th vol. of the *Nouveau Cours D'Agriculture*, page 487 and in the *Atlas des Cours De Culture* by Andre Thouin, plate 55, letter R. 'I WILL TRY' was the remark of one of our gallant officers, when ordered to storm a battery. Respectfully submitted,

H. A. S. DEARBORN,
Pres. Mass. Hort. Soc.

Horticultural Hall, August, 27, 1831.

Resolved, that the thanks of the Society be presented to Doct. Van Mons, of Louvain, in Belgium for the scions and portions of his Pomographic *Belgique Moderne* which he has been so kind as to transmit.

Resolved, that the scions sent by Doct. Van Mons be placed in charge of Mr Manning of Salem, Messrs Winships of Brighton, Mr Kenrick of Newton and Mr Davenport of Milton, with a request that they engraft them in the manner named by Doct. Van Mons and make a report of the result to the Society.

MA FESSENDEN—I send you a few extracts from some of the recently received numbers of the *Annales D'Horticulture*.

The experiment on the peach made by Mr Odart promises most interesting results, and is well worthy of repeating on all the varieties of fruit trees; but it is too late to attempt it this season.

The cultivators of the silk-worm in the United States, may find it expedient to adopt the mode suggested by Mr Audibert, of rearing the *morus multicaulis*. Yours, &c,

H. A. S. DEARBORN.

EXTRACT NO. XXXV.

From the *Annales de la Société D'Horticulture de Paris*.
Note upon the observations of Mr Odart in relation to a method of increasing the size of fruits by Professor Poiteau.

If the following experiment is confirmed, it will singularly enlarge our physiological ideas, and become a mine of prosperity to our pomologists. M. Odart observes: Having made ten years since, an annular incision, or in a single word, a circumcision, on the branch of a peach, the usual result was a great precocity, and an increase of the size, of all the fruit which it bore. I was induced the same year, to take a bud from this branch and inoculate it upon an almond stock, and it having taken, I trained the tree as an espalier the following season. This tree has constantly produced fruit, as beautiful as that which grew upon the circumcised branch, and consequently superior to that which grew naturally on the other parts of the same tree; they have preserved their firmness, which is an effect of the circumcision, and lost their bitterness, which is also an effect of this operation on the peach.

It is much to be regretted that M. Odart had not circumcised a branch of this new peach tree, in order to obtain still larger fruit, and that he had not taken a bud from this circumcised branch to obtain a third tree, with still larger fruit and so in succession, to ascertain how far nature would lend her aid in this gradual increase of the size of peaches.

POITEAU.

EXTRACT NO. XXXVI.

Extract from a letter of Mr Judibert to Doct. Loiseleur Deslongchamps, member of the Committee on economical and medicinal plants.

OCT. 17, 1830.

The Mulberry of the Philippines, or *morus multicaulis*, having a more active and prolonged vegetation has suffered a little more from the severe cold of the last winter, than the other varieties of the mulberry; still we have plants fifteen feet high, in a dry situation, whose sap was sufficiently arrested on the arrival of the cold weather, as not to have been the least injured. Now I think of it, let me inform you, that they produced this year a great abundance of long black, and sufficiently beautiful fruit, which is very good to eat, not being so insipid as the white mulberry, but having a taste intermediate between the red and black mulberry. Thus the mulberry of the Philippines presents a double advantage, as it can be cultivated as a fruit tree, and also as very useful for the nurture of silk worms; but nevertheless for the latter purpose it is not expedient in our climate, to raise tall trees, because the large and tender leaves present too great an obstruction to the wind, which so lacerates and injures them, that the best mode of cultivating the *morus multicaulis*, for the support of silk worms, is in hedges with low stocks.

AUDIBERT.

EXTRACT NO. XXXVII.

NEW CAMELLIAS.

The taste of enlightened amateurs for the magnificent flowers of the Camellia, increases so rapidly that we consider it a duty to inform them, that M. Noisette having formed a seminary in 1821, several of the plants raised from the seed bloomed this year, and that four of them deserve a distinguished place among the varieties which constitute so great an ornament of the garden, and merit a participation in the admiration they receive.

The following names, and principal distinctive characteristics have been given by M. Noisette.

1. *Camellia spiralis*. Flowers numerous, very double, clear red, mean size, petals considerably rounded, concave and disposed in spirals, which is a curious novelty.

2. *Camellia floribunda*. Flowers of a deep rose color, very numerous, three inches in diameter, having in the centre some stamens elegantly mingled with the petals, of different forms, the most of them striped with white longitudinal lines.

3. *Camellia atrovirens*. This derives its name, from the very dark green color of the leaves; the flowers are semi-double, flame red, and at least three times as large as those of the common single camellia.

4. *Camellia minima*. Flowers small, and of a deep rose color, having the petals of the centre formed into an elongated cornet, which gives to the flower in other respects a very beautiful and singular appearance.

UNDERDRAINING.

MR FESSENDEN—I have become so deeply impressed with the utility of underdraining, that I venture to trouble you with a few remarks on the subject, in the hope that they may be useful to some portion of your readers.

My farm is a sand loam, reposing generally upon clay, with a gentle undulating surface. I have several swales, where in the process of time, the upper strata has been washed away, and through which there are running waters requiring open drains. In the spring of the year, and in wet summers, the surface water penetrates the soil of the higher grounds to the clay strata, and following the inclination of this to the swales, breaks forth in numerous places, saturates the grounds below, renders them wet, cold and poachy, and unfits them as well for the finer nutritious grasses, as for the purposes of tillage. Thus those parts of my farm which were intrinsically the best soil, were in a manner useless. To remedy the evil I resorted to underdraining; and the result has greatly exceeded my expectations. Being wholly destitute of stone, the proper material for underdraining, I have been obliged to use saplings and brush as a substitute. The first object is to mark out the line on the slope of the swale, at which the water first shows itself at the surface, which is best done after the ground has been ploughed and harrowed in the spring, then cut a trench, with a sufficient inclination to carry off the water, *above the marked line*, from three to four feet deep. I collect green saplings, from two to six inches in diameter at the butt, with the tops and branches entire, (I prefer and generally use evergreens) and cut them into lengths somewhat exceeding the depth of the trench. I then begin at the head of the trench to lay them in, butts down, and sloping towards the low grounds; one man hands the brush, and another fits and treads them down, until the trench is literally filled. The earth is then thrown on, taking care to bring all the brush within the edges of the ditch, that it may settle evenly. In a short time the whole of the brush is found to have settled below the reach of the plough. I estimate the duration of this kind of drains at from 12 to 15 years, and there is no doubt of their proving efficient when well constructed, particularly when water is constantly passing through them. I omitted to state that the whole of the excavated earth is thrown back upon the brush, forming a ridge, which in a short time settles to near the ordinary level, and which, in grass grounds is sown in autumn with seeds.

In the experiments I have made, the increased value of the first, or at all events that of the two first crops, has afforded ample remuneration for the expense of underdraining. I am this day (Aug 21,) bringing in my second crop of hay and a good one from an acre of ground reclaimed by underdraining, on which, before this process, the product never compensated for labor.

The expense will vary according to circumstances; but as the labor may all be done by the ordinary workmen on a farm, and at times of most leisure, it is matter of but secondary consideration. To give some data however, I will state, that I paid to one man, it being his asking price, at the rate of 62½ cents for completing 28 yards, the brush being furnished him on the spot. Another man now in my employ, made 40 yards of trench in a day, averaging 3½ feet deep, and by 9 o'clock on the second day, the brush being cut and handed to him he had the same covered and completed. Esti-

inating all the labor, the average expense to me has been from 6 to 8 cents the yard.

The system of underdraining has nowhere in this country, to my knowledge, been so successfully adopted as on a farm of 250 acres, belonging to H. W. Delavan, Esq. of Ballston. This gentleman, distinguished alike for intelligence and enterprise, has in a few years, nearly quadrupled his products, by underdraining and other judicious management. Extensive fields, that abounded in springs and poachy ground, and which made but a sorry return for the expense of cultivation, have been reclaimed and ameliorated, and rendered highly productive and the whole farm now exhibits one of the best specimens of neat and profitable husbandry that is to be found in our country. A detail of his farming operations, particularly in draining, would be highly interesting and useful; and from the laudable ambition this gentleman has always manifested to be useful to his country, I venture to say he would not withhold a detail of his agricultural improvements, if requested to furnish it for your journal.

Warren, Aug. 22, 1831.

J. BEEL.

We should be happy to receive and publish any communications relative to the improvements alluded to.—*EDITOR.*

PRESERVATION OF THE SWEET POTATO.

MR ESSENDEN—The successful cultivation of this valuable addition to our edibles, depending, in some measure, on the preservation of the seed tubers through the winter season, in a state fit for germination, the discovery of some adequate means for attaining this object was deemed an interesting subject for chemical investigation. Although partial success only has attended the experiments instituted thus far, a more correct knowledge of the circumstances under which the decomposing changes take place, has been obtained, and we have reason for the conclusion, that an exact method is within the scope of careful experimenting.

Having received the assistance of Mr Isaac Wyman of Roxbury, in that part of the experiment relating to the cultivation of the preserved seed, I consider, that if the experiments are of any practical value, much of it is due to his attention.

In a theoretical point of view, the attainment of the object depends on the following circumstances.

1. In choosing a situation where the temperature is such, as not to destroy the germinative power of the seed by desiccation, or to excite it to act prematurely; so regulated, that congelation of the juices could not take place, and so equable, that sudden changes would not occur.

2. The absence of an excess of moisture, over that naturally belonging to the tubers, and essential to their healthy state.

3. The presence of an atmosphere, favorable to vegetable life and if possible, possessing antiseptic power.

The closest approximation to these properties is found in a medium of loosely compacted, powdered charcoal. Its feeble conducting powers render an elevation, or reduction of temperature, within the mass, from any cause without, almost impossible, and the same property enables it to retain its original temperature for a long time unchanged. Its relations to moisture are such, that, we are enabled to render it so dry and absorbent, as to prove a powerful desiccator; so moist, as to form a vegetating source and hasten putrefaction

in vegetables, or to use it, in a condition to absorb or impart moisture, as its temperature is diminished or increased. In contact with moist vegetable matter, it generates carbonic acid, a gas, which in moderate quantities is not prejudicial to vegetation and which possesses antiseptic powers, in a high degree. With this substance the following experiments were made.

Late in Nov. 1829, a quantity of marketable charcoal was reduced to a coarse powder and freely exposed to the solar rays several hours. Some small tubers from seed of the Virginia kind of sweet potatoes, raised on the estate of John Lowell, Esq. after being dried were packed in a cask with the prepared charcoal, in such a manner, that each root was surrounded by it and the separate layers had a distance of half an inch. The cask was imperfectly closed and placed in a situation, where the temperature for several months of cold weather varied but little from 60° Fahr. After a few weeks from the contraction of the wood, the hoops dropped and the joints were quite open, no further alteration was noticed. About the middle of April 1830, the contents of the cask were inspected, those roots which occupied the sides nearest the cask were dry and brittle, those nearer the centre were perfectly healthy and well preserved, many of them having sprouts and put out embryo leaves; a few had decayed and rendered the charcoal moist and warm in the vicinity; of the whole quantity put up, a few less than one half, were in a state fit for immediate cultivation. These were planted by Mr Wyman and in the usual season, the table was supplied from this source.

From the results of this experiment, it was inferred that the charcoal was too dry when first used and that the situation was objectionable, from the temperature being too high.

Early in Nov. 1830, some charcoal which had been laid on moist earth, for the absorption of moisture was reduced to a coarse powder and used for packing in the same way; some of the tubers produced from the subjects of the former experiment, together with more from the original source; a part of these, were cut and bruised by the hoe, all were fresh from the earth. The cask containing them, was placed in a larger one, and the space of one, or more inches in width all round, was filled with ashes;—the experiment noted as A.

Another cask was filled as before, but the charcoal was moistened, the containing cask was enclosed in another; the experiment noted as B.

The third cask was filled as the others, but the charcoal was rendered sensibly wet, the cask was not enclosed. Another situation was chosen, the temperature of which, was seldom so low as 32° Fahr. nor higher than 60°; in this the casks were placed until the termination of the experiments.

About the 1st of April, 1831, the casks were opened, that of experiment A. containing much moist charcoal; a part of the tubers had vegetated, put out leaves or shoots, and decomposed into a soft moist matter, another portion was advancing to the same state, some with shoots were perfectly sound and healthy and all which had been cut or bruised were sound and just sprouting. More than one half of the original quantity was fit for planting, and many of those rejected as worthless, resumed, under more favorable circumstances, their usual powers.

Experiment B. served only to establish the fact, of the prejudicial influence of too much moisture, a few only of the roots were preserved, the rest,

without any traces of vegetation, had decomposed in the cask containing wet charcoal, putrefaction had taken place, no traces of organization remaining. The results of experiment A. are such as to afford grounds for the conclusion, expressed in the first part of this paper; we have only to vary in a degree, our mode of experimenting, to overcome any difficulties which have been observed. The most important and favorable indication is, that in every instance, vegetation had preceded decomposition, that it had arrived at a stage, in which it required a change of situation, or premature decay was induced. To check the disposition to vegetate and still maintain the circumstances as nearly the same as possible, will be an object in future; experiment and accident has pointed out to us, one mode, in which this effect may be produced. It is probable also, that if the time in which the subjects are exposed, was shortened by removing them from their original situation, to one recently prepared, of the same material in the same state, complete success would be insured.

Roxbury, 24th Aug.

A. A. HAYES.

DESTRUCTION OF INSECTS.

MR ESSENDEN—Now is the time to destroy caterpillars. The eggs, from which they are produced, are now to be found in bunches on the twigs of fruit trees. By taking off those bunches the vermin are destroyed in the egg. The color of the bunches is now so much darker than the bark of the twig, that they are easily found; it will, by degrees, become lighter, until it will be very near the color of the bark. The eggs are laid in July. They remain, where laid, unaffected by change of weather, by frost or heat, until spring, when they are hatched by the flowing of the sap, and vegetative power of the twig. Each bunch of eggs will produce a swarm of caterpillars that will have a nest by themselves. The nest is usually built on the branch that bore the twig on which the eggs were laid. As caterpillars have no disposition to leave the tree, on which they were hatched, until the time when they leave their nest and separate to come together no more, it is very easy to keep small trees free from their nests, by destroying the eggs.

I found, the first week in July, this year, that many bunches of eggs were then laid on my peach trees, and small apple trees. I have since taken from those trees more than five times the number of bunches of eggs that I have ever before seen on such trees in one year. If in other places, such quantities of eggs are laid as were on my trees, and they be not destroyed before hatching, the caterpillars, next spring, will eat all before them, in spite of all opposition.

A few twigs, with bunches of eggs on them, taken from a peach tree, and from an apple tree, the 26th of July, will be sent, with this, to you, to be shown to any person, who may wish to see them. For that purpose will you be pleased, officially, to receive and dispose of them and of this, as the safety and beauty of fruit trees, another year, may seem to you to require. A FARMER.

Remarks by the Editor.—A little attention to the objects recommended above will save much time and labor, and much more effectually accomplish the destruction of caterpillars in many instances, than can in any other way be accomplished. The twigs mentioned by our correspondent, with the eggs of the insects attached to them may be seen at the office of the New England Farmer.

From the Lowell Journal.

We ask attention to the following communication, it being the first of a series on the Silk Manufacture, furnished us by an intelligent gentleman of this vicinity, who has devoted much time to the subject, and is preparing to go largely into the cultivation of the mulberry tree. It is hoped that the farmers in this region will follow his example, and capitalists will afford the means for the establishment of the silk manufacture in this town. There can be no doubt, we apprehend, that it would be a profitable kind of manufacture.

SILK MANUFACTURE.

NO. 1.

MR KNOWLTON—If you think it will be useful or amusing to your readers, please to publish the following letter; and I will communicate other extracts from the writings of the same gentleman, with occasional remarks. Mr D'Homergue is now in Philadelphia, but will return to France next Spring, unless the government, or individuals, shall give him a reasonable compensation for the valuable information he possesses relative to the culture and manufacture of silk. He is the only person, at present in the United States, who is acquainted with every branch of the business, not only in the manufacture of the silk, but in the cultivation of mulberry trees, raising silk worms, and producing cocoons. If we omit this opportunity of obtaining the requisite information, it may be many years before we shall bring into market this new and valuable production, which must at some future time, become a great staple of this country.

WASHINGTON, February 23, 1831.

SIR:—The bill for promoting the growth and manufacture of silk having been reported by the Committee on Agriculture, several members of the Congress have, in consequence, asked of me some information as to the productiveness and relative value of this branch of industry. I take the liberty, Sir, to submit to you the following facts in reply, which I respectfully pray you to communicate to the honorable House over which you preside.

In one acre of land there are 43,560 square feet, on which may be planted 3000 mulberry trees. These will yield, at the age of seven years, 90,000 pounds of leaves, producing 7,500 pounds of cocoons. At twenty-five cents per pound, these cocoons would sell for \$1,875.

These facts, Sir, are deemed sufficient to prove the superior profits to be derived from the culture of silk.—I may be allowed to add, that, in the space of seven years, from 1821 to 1829, France and England imported raw silk to the amount of \$340,000,000. In proof of this enormous importation, the documents are now in the Library of Congress.

I have the honor to be, with great respect, Sir,

Your very humble and obedient servant,

J. D'HOMERGUE.

To the Hon. ANDREW STEVENSON.

Speaker of the House of Representatives.

We are gratified to learn, from a gentleman who has recently consulted Mr D'Homergue, that he is willing to come to Lowell and erect all the necessary machinery for reeling the silk from the cocoons, and preparing it for the loom, whenever the quantity produced will justify the expense. When sufficient encouragement shall be offered, either by the Government or individuals, he will

open a school for the instruction of such persons as may wish for the information in the art and mystery of all branches of this profitable business. Several gentlemen in this vicinity are planting extensive nurseries of mulberry trees, and we have reason to believe, that sufficient quantities of cocoons will be produced, in two years, to justify the erection of a filature at this place.

The process of raising mulberry trees is extremely simple, and instead of injuring them by transplanting, they are improved and will grow more rapidly than such as are left in the seed bed. The dwarf or bush mulberry, which is very productive and profitable, will grow upon a light sandy soil, that is not suitable for the cultivation of other plants. On such land the seed should be sowed in April, or early in May, and if the ground could have a dressing of manure from swamps or meadows, before the seed is planted, it will yield more bountifully. One ounce of seed on five square rods of land will be as much as can conveniently be cultivated; and if they are intended to be transplanted, when one year old, the rows may be eighteen inches apart; but if they are intended to remain in the seed rows, they should be three feet apart. Nothing should be planted between the rows, for it will be profitable to pass a light plough, or small harrow, between them, for the purpose of removing the weeds, and keeping the ground in good order. In two years from the time the seed is planted, the leaves will be fit for use. Several gentlemen in this vicinity will have thirty or forty thousand young trees to sell next spring, at a very moderate price, to any persons, who are disposed to try experiments.

BOSTONIANS.

It appears that the Bostonians have it in contemplation to ornament their city, by forming an experimental garden in its immediate vicinity, in which are to be made such experiments in Agriculture and Horticulture, as shall be thought useful to the community at large. When we consider what the people of that place have already done towards advancing the character and interests of the United States, it ought to excite more emulation than we see manifested at present by the inhabitants of other states. With a climate and soil less favorable to agricultural pursuits than many of the more southern or middle states; more curtailed in the facilities for manufacturing, when we take into consideration the natural productiveness of the soil in the immediate vicinity of her water privileges, and the amount of water-power which is at her command; we are struck with astonishment at her performances, and the inquiry naturally presents itself, 'what sort of people are these Bostonians?' History with her records will answer to the present, as well as to future ages, 'they are the people who dared to risk' their lives, their fortunes, and their sacred honors, in the cause of liberty.—they are the people who formed the front-rank, when the despotic and combined powers of Europe threatened us with annihilation, and they are the people, who with a parent's care, have unceasingly nursed and cherished the tree of liberty by introducing manufactures, and facilitating agriculture and the arts. And they are the people, who, (notwithstanding the cry of nullifiers against the *yankees* and their notions) remain caterers and bankers of these United States.

The success attending their honest industry has

at times raised a hue and cry of envy against them from some of her sister states, which she, with true philosophy, has passed unheeded, knowing it to be the weakest passion which degrades our natures. They have been the constant encouragers of commerce, and their ships are to be found from 'India to the Poles.' But it is in regard to their improvements in Agriculture and Horticulture, that we would more particularly notice them at this time. There can be named a certain number of gentlemen, in the immediate vicinity of Boston, who have done, and are still continuing to do, more for the advancement of these sister arts, than the same number from any other or all our sea port towns together. As their vessels traverse every sea, their opportunities are great for making collections from the animal and vegetable kingdoms; nor are those opportunities neglected. Nor are they collected with a miserable intention of being hoarded up, for the special enjoyment of the individual, but distributed with a liberality bespeaking the nobleness of the intent.

The cities of Europe had long been visited by plagues, and sweeping desolations, when the independent genius of Bonaparte, determined on removing the causes, (which were acknowledged to be accumulated quantities of putrefying animal matter, collected in the burying grounds in large cities) so far as was within his power. Accordingly those in the city of Paris were removed; the bones were deposited in the catacombs, and the earth replaced with soil, free from contagion. A new burial ground was laid out on the east side of the city, and without the walls, which, from the diversified and elevated surface, as well as for the taste in arranging, has become one of the most enterprising places in the vicinity of Paris if we except the garden of plants.

The Bostonians have now conceived the idea of combining all that is interesting in these two places of notoriety, and also of adding a third, which shall render their contemplated improvements, equal to anything that Europe can boast of, of the kind, viz: that of having combined a Rural Cemetery, a Botanic garden, and an Experimental farm. Should they succeed in this, Boston will be rendered altogether the most interesting city in the United States. Now we hope that other towns will consider the importance of making public improvements, and be up and doing. There is scarcely a large town in the United States, but what has neglected two things, which are indispensable for the health of the population, viz: 1st to secure, and keep open as public property, a sufficient number of squares for the accommodation of families where they may send their nurses with their small children, and have them safe from the common barn of crowded streets. 2dly, To locate proper places for the burial of the dead, at such a distance from the populous part of the town as shall render them free from the effects of the pestilential effluvia, arising from putrefactive animal matter. We should naturally suppose that after such a sweeping sickness as New York was visited with, a few years since, which undoubtedly originated at one of their cemeteries, that not one of these depositories would be left within the precincts of a city. But such is the fact, and should the worthy citizens of Boston persevere in their calculations, in regard to their intended cemetery, they will give us another example of their steady perseverance in the march of improvement.—*Genesee Farmer.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, AUG. 31, 1831.

We beg leave to call the attention of our readers to the Prospect of a Botanical work which Messrs D. & C. Landreth of Philadelphia are about to undertake. This plan deserves all encouragement, and they possess rare materials and facilities for its accomplishment.

Mr D. T. Browne, the industrious Editor of the Naturalist, proposes to publish in this city, the New England Sylva, containing a description of the forest trees in New England; with their uses and manner of culture and propagation; to make a duodecimo volume of about 200 pages, ornamented with plates, price \$1.00. Such a work, faithfully executed, we think would meet a ready sale.

Edinburgh Review.—Lilly & Wait have just republished the 100th number of this able and popular Journal, which contains elaborate disquisitions on the following subjects: Pretended Miracles; Irving, Scott and Erskine—Williams on the Geography of Ancient Asia; Geographical Distribution of Animals—Hon. Mrs Norton's Undying One—Reynolds on the Egyptian Museum at Leyden—Universities of England; Oxford—Observations on the Paper Duties; Taxes on Literature—Government of British India—The Dissolution and General Election, with Suggestions to the Peers—Political and Vested Rights—Moore's Life of Lord Byron—Quarterly List of New Publications—Index—published quarterly at \$5.00 per annum.

CUCUMBERS.

MR. EDITOR.—It has of late become fashionable among a certain class of newspaper scribblers to decry cucumbers, and represent them as unwholesome, and worse than useless. For upwards of 70 years I have been gratified in their annual use, and have no remembrance of ever experiencing any injury, from the moderate use of them. Therefore, as respects the most valuable and laborious part of the community, I have no idea that this article, which has been agreeable to all generations before us, is now to be despised and avoided. I am ready, however to admit,—that the idle, the sickly, and lazy part of the community ought to abstain from cucumbers, as well as many other things made for the sole comfort and pleasure of the human family whose happiness is intimately, if not inseparably, connected with a laborious life.

Newton, August 28.

J. KENRICK.

Horticultural Hall,
Saturday, August 27, 1831.

FRUITS EXHIBITED.

Apples. By Mr Solomon Lyman, of Manchester, Conn. a specimen of a native variety of large size, yellow, fine flavor, and worthy of cultivation.

By S. Philbrick, Virginia Amber Crab Apples.

By R. S. Phipps, York Russett and another variety.

Pears. By Hon. H. A. S. Dearborn, a Ripe Specimen of his Seedling Pear. This fruit is rather under the medium size, skin smooth and fair, light yellow, very melting, and of fine flavor, compares well in quality with the St Michael, and bids fair to be a valuable acquisition to our list of summer Pears. The Committee propose that it be called the Dearborn Pear.

By R. Manning, specimen of Juliette (Coxe No. 32), not in eating. Melon Pear received from Mr Carr, but appears to be the Juliette. Revelliere, from a French tree, and a kind supposed to be the Cassiolette. The last at maturity, and of good flavor.

By Mr S. Philbrick, Brookline, Capiaumonte, handsome but not at maturity—also, the Long green or Mouille Bouche.

By Mr R. F. Phipps, Andrews Pears.

By Mr Richard Ward, a variety of Bergamot. *Peaches.* By Mr Otis Pettee of Newton, a handsome collection, embracing twelve varieties, some of which were fine.

By Mr Charles Tappan, Brookline, a Seedling handsome in appearance, and of fine quality.

By Mr E. Dyer, a handsome variety.

By Mr E. Vose, Dorchester, Yellow Rateripe, Jacques Rateripe, and an uncommonly beautiful specimen of the Grosse Mignonne, the last of large size, and excellent flavor.

Plums. By Mr R. Manning. Large Blue Holland.

By Mr E. Dyer, a handsome variety, but not in eating.

Grapes. By Mr William Gault of Concord, N. H. A large and fair specimen of Purple 'Fox' of good quality.

By Mr Henry D. Child, Early Black Morrillon—of pleasant flavor.

By Mr Charles Lawrence of Salem—White Chascelas and Black Hamburg, very handsome specimens of open ground culture.

By Dr S. A. Shurtleff, a seedling Grape of fine quality, somewhat resembling the Black Hamburg, of a Lilac color—it is proposed to be called 'Shurtleff's Early Lilac.' The committee have received a particular description of this Grape from Dr Shurtleff, a copy of which is annexed.

S. DOWNER, Chairman.

This Grape is a native, from a foreign Seed. It came up in my garden about six years since; it was transplanted by me four years since, where it now stands; it bears only one bunch on a branch, and on the fifth eye from the last year's wood; the stem is slim, bunches well formed, and berries large, of an oval form; ripens in August, about the 20th.

Pemberton's Hill,

Boston, Aug. 26, 1831.

FLOWERS EXHIBITED.

From N. Davenport, of Newton, a fine Plant of *Marantha zebra*—Fine double Tuberosc—China Asters, Monthly Roses, &c.

A Cocoa Nut Tree from B. H. Norton, of Hingham.

China Asters, Marigolds, &c, from Wm. Worthington, Dorchester, and S. Walker, Roxbury.

The following were exhibited by Mr Carter, from the Botanic Garden, Cambridge, on Saturday, Aug. 10, and omitted:

Hibiscus palustris viri—double and single Dahlias—*Phlox paniculata*—*Phlox pyramidalis* and *scabera*—*Snow berry*—*Liatris macrostachys* and *pilosa*—*Euphorbia corollata*—*Delphinium sibiricum*—*Dracopis alpinum* do. *dentatum*—*Sagittaria latifolia*—*Sanguisorba canadensis*—red and white water lily.

VEGETABLES.

Mr Richard Ward of Roxbury exhibited some extraordinary fine Lima Beans, for premium. They were raised on a deep rich soil, manure spread and dug in late fall, planted the 18th of May, about one inch deep, ten to a pole, the poles four feet apart every way.

D. CHANDLER, Chairman.

HON. H. A. S. DEARBORN,

Pres. Mass. Hort. Society.

SIR—I have thought it proper to advise the Members of the Massachusetts Horticultural Society, through you, that the trees which were so generously presented to them by Messrs PRINCE & SONS, of the Linnaean Garden, New York, and which were entrusted to our care by the Society, are all (with the exception of a few Cherry and Apricot trees) growing finely on our grounds in Brighton. As this is the season for budding, members are advised to avail themselves of the opportunity of supplying

themselves with buds of some of the finest varieties of fruits in the country. As far as the trees have produced fruit, they prove the correctness of Mr Prince's Establishment.

The scions sent from Henry Corse, Esq. of Montreal, are all living, with one exception, (the Admirable.)

A catalogue and description of Mr Prince's trees will be found in the New England Farmer, vol. VII. page 385. A catalogue of Mr Corse's scions in the Farmer, vol IX. page 329.

Yours respectfully,

J. & F. WINSHIP.

Brighton Nursery, Aug. 29, 1831.

BUDDING PEACH TREES.

As the season has arrived for budding peach trees, we would caution those who are wishing to improve their fruit, against using or having used for them any buds, unless they know that they were taken from healthy trees. The disease called the yellows has been introduced amongst us from some of the eastern nurseries, and has already destroyed many of our peach trees, and will, unless care is taken, destroy many more. A single bud taken from an infected tree and set in a healthy one of any size, is sufficient to kill the tree within a few years, whether the bud lives or not; and we are persuaded that the disease may be communicated by trimming a tree with a knife that has been used to trim a diseased one, upon which the least possible quantity of the juice remains. It therefore not only requires the greatest care as respects buds, but in pruning one tree after another, with the same instrument. As there are a number of men travelling the country offering their services for budding and grafting fruit trees, who, although they are capable of setting buds or scions, are at the same time so ignorant of this disease among peach trees, as to be unable to detect it, they may do an injury to individuals who employ them, which is beyond their power to repair. One of the surest indications of this disease is the premature ripening of the fruit. We have examined a tree the week past, of the lemon peach, the fruit of which had the appearance of maturity, and some of them were quite mellow, although the proper season for this fruit to perfect itself is the last of August or the fore part of September. Having known the tree mentioned for several years, and having seen the fruit from it in fine perfection, in years past, we are of opinion that the disease has been communicated to it by a saw or other instrument which had previously been used in pruning a diseased tree. As the peach is a fruit liked by most people and has been of easy cultivation in this country we entreat horticulturists to make exertions to prevent the spread of this fatal disease which otherwise would soon destroy all the trees in our vicinity.—*Genesee Farmer.*

SHAKERS' BARN.—The Shakers of Harvard are building a barn, which, is probably larger than any structure of the kind on this continent. The dimensions, as we are informed, are one hundred and fifty feet in length, and forty five in width. It is four stories in height, and the calculation is to drive in on the upper floors, from the hill-side, and pitch the hay down, thus rendering much hard labor easy. The cost of this barn, when completed, is estimated at \$3000.—The Shakers of Canterbury, N. H. we are told, have a very large barn, but it is excelled by the one at Harvard.—*B. H. Aurora.*

NOTICE.

A Special Meeting of the Massachusetts Horticultural Society will be held on Saturday next, at 11 o'clock, at the room of the Society, for the purpose of making the necessary arrangements for the next anniversary of the Society.

R. L. EMMONS, Secretary.

Botanical Prospectus.

D. & C. Landreth, Nursery and Seedsmen of this city design to issue early in the ensuing autumn, the first number of a periodical work on Ornamental Plants. Of all branches of Natural Science, Botany has ever had the greatest number of admirers; it has been the study of the learned in all ages and in all countries; it charms alike the aged and the youthful, and always presents on either hand, something new and interesting; whether wandering on the mountain top, or traversing the morass, a knowledge of the structure and classification of plants affords the means of abundant interest and employment. Unlike the study of some departments of Natural History, no investigations are to be made but such as are agreeable, and in the language of the late president of the Linnean Society, "all elegance and delight; its pleasures spring up under our feet, and as we pursue them reward us with health and serene satisfaction."

The proposal work will be modelled somewhat after the Botanical Magazine of Curtis (English); to Floriculture and the delineation of plants it will be mainly directed—yet it will afford opportunity for occasional remarks on the elementary and physiological parts of Botany. It will be issued monthly in a quarto form, each number embellished with at least four elegantly executed lithographic drawings, colored true to nature, by an artist of high reputeability.

The plants to be delineated, (as well native as exotic,) will be selected with reference to their beauty, ease of cultivation, and other desirable qualities, and embrace those of the hot-house, green-house, and open air. Each figure will be accompanied with an accurate botanical description; its natural family and Linnean class and order; its history; its use, if any, in medicine and the arts, and other remarks likely to prove interesting; together with minute practical instructions for its propagation, soil, culture, and preservation.

Unceasing are the requests made the advertisers for instruction as to the culture and general treatment of plants; also, for descriptions of such new ones as their catalogue annually announces. It is believed the work will not only meet the wishes thus expressed by their numerous patrons, but prove useful in nourishing a taste for Horticulture.

They are not stimulated to the undertaking solely by the prospect of pecuniary gain.—Their collection of plants present facilities for contributing, through this medium, to the rational and intellectual enjoyments of their fellow-citizens; it is therefore intended to issue the publication on the lowest terms possible. The price however must depend in a degree on the patronage extended, though under no circumstances will it exceed eight dollars per annum.

☞ Due notice of its publication will be given. Philadelphia, August 13, 1831. aug 16.

Notice.

The subscriber wishes to procure a small quantity, say half a plot, of acorns from each species of oak growing in New England, with the specific, or where not known, the common name. It is desirable that each should be sent by the 1st of November, with the contributor's name, as they are to be forwarded to the London Horticultural Society. Any reasonable expense with regard to the above will be cheerfully paid.

4t

J. B. RUSSELL.

Pear Seed.

The subscriber will pay a liberal price for half a bushel of fresh Pear Seeds.

4t

J. B. RUSSELL.

Strawberry Plants for Sale.

The following varieties of Strawberry Plants are for sale by David Haggerston at the Charlestown Vineyard: Keen's Seedling, 75 cents per dozen, or \$5.00 per hundred; the undernamed kinds at \$1.00 per hundred, each: Wilmot's Superb, Royal Scarlet, Roseberry, Mulberry and Pine Strawberry.

☞ The above will be also for sale at Mr Russell's Seed Store, Boston, at the same prices—no smaller lot than 50 will be sold of any kind, except Keen's Seedling. Aug. 31.

Plum and Cherry Stones Wanted.

A liberal price will be paid by the subscriber for one bushel of Plum Stones and two or three pecks of Cherry Stones, to be warranted of the growth of 1831.

Aug. 21.

4t

J. B. RUSSELL.

Bees.

The Subscriber has 300 swarms of Bees for sale, in his Patent Slide Beehives, at 20 cents per pound, weight of each swarm from 40 to 100 lbs. tare of hive deducted; the price of the Patent hives is \$2 a piece, and the price of a single right \$5.

Also for sale, 200 swarms of bees in the old fashioned hive, price 17 cents per pound, tare of hive deducted. The above will be delivered within fifty miles of Boston, in good order, (warranted free from moults or otherwise damaged) by the first day of March, 1832.

All letters must be sent in before the first day of September, 1831, post paid, to the subscriber, at Brighton, Mass., so as to have time to transport them from Maine. N. B. The weight of the above hives will be taken in September.

Seeds for Fall Sowing.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—Garden and Field Seeds, suitable for fall sowing, among which are—

WHITE PORTUGAL ONION.

PRICKLY SPINACH, (for early greens.)

BLACK SPANISH or WINTER RADISH

LONG DUTCH PARSNIP, and a variety of other garden seeds.

Also—TIMOTHY or HERDS GRASS—ORCHARD GRASS—RED TOP, RED and WHITE CLOVER, &c. &c. Aug. 3.

Ammunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. J. Jan.

Dale's Hybrid Turnip Seed.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A few packages of seed of this new variety of turnip, so highly esteemed in Scotland, and which is described in No. 3, vol. x. N. E. Farmer.—Price 12½ cts each paper.

Turnip Seed.

For sale at the Seed Store connected with the New England Farmer, No. 52 North Market Street, Boston, 500 lbs. White Flat Turnip Seed, the growth of the present season, raised in this vicinity expressly for this Establishment.

Also—Ruta Bags of the very first quality, of both American and European growth; Yellow Aberdeen, Yellow Stone, White Norfolk Field, and Yellow French Turnips; Long Prickly and other Cucumbers, for pickling, warranted genuine and fresh. July 6

A Gardener.

A Gardener, with good recommendations, recently from Scotland, wants a situation. Inquire at the N. E. Farmer Office. 4w Aug. 21.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention. EBENEZER WIGHT,

46, Milk street, opposite Federal-st., Apothecary. Aug. 3. cp1f

Wanted,

A situation for a boy 12 years of age, in the country, as an apprentice to a farmer, or any good mechanical trade. For further particulars inquire of T. T. ROBERTS, No. 5 Union street. 2t Aug. 24.

BRIGHTON MARKET.—Monday, Aug. 29.

[Reported for the Chronicle and Patriot.]

At Market this day 426 Beef Cattle, 713 Stores, 11 Cows and Calves, 3705 Sheep, and 370 Swine.

PRICES.—Beef Cattle—Cattle today were not so good as usual, and the best qualities were sold early in the morning: the best were taken at about \$5, good at 4 33 a 4 75, and thin at 2 50 a \$4.

Stores—Nearly all were sold.

Cows and Calves—No sales noticed.

Sheep and Lambs—Sales not very brisk—several lots remain unsold: prices a little reduced. We noticed sales at 2 50 a 2 33 for prime; good Sheep at about \$2; and ordinary qualities at 1 84, 1 75, 1 71, 1 62, and 1 50.

Swine—Considerable doing—we noticed lots taken at 4c, 4½, and at 4½ at retail; 4½ for Sows, and 4½ for Barrows.

New York Cattle Market, Aug. 26.—The market has been as well supplied with Beef Cattle this week as is customary. The whole number being about 600 head, and of course in good demand, and all sold; we quote Beef Cattle at \$5 a 7 1-2 per hundred, and a few at 7 25. From 3000 to 5000 Sheep and Lambs, which is an ordinary supply, all sold quick at \$2 a 6 for sheep, and \$1 50 a 3 for Lambs. Fat Hogs—still a few in market at \$4;—stored do at \$3 25 a 3 75. Cows and Calves at from \$15 to 45.—N. Y. Daily Adv.

MISCELLANY.

State of Female Society in Persia.—According to the doctrine inculcated by Mahomet, the women in Persia are not only excluded from all society, but asked so little, that a traveller might pass through the whole country and not see a female face; as the Persians are, perhaps, even more jealous than the Turks. The Armenian and other Christian women living amongst them, are obliged to conform to Mahometan law in this respect, and cover their faces, and wrap up their figures in a large sort of domino or *feragee*, in the same manner as the native women, or they would be insulted. So naturalized are the Christians to this custom, that it was the cause of a great disappointment to us upon one occasion. An Italian doctor, who had lately been married to an Armenian, was polite enough to endeavor to induce his bride to uncover her face for our curiosity and amusement; but his best efforts to persuade her it would not be improper were in vain. The lady even smoked a *kaliaun* (the Persian hookah) whilst we were in company with her, but kept it under her veil; it was altogether a most ludicrous scene. In vain we told her that it was unfair she should have the opportunity of seeing us through the little holes of her dress, and that we could not be permitted the advantage of seeing her, even with her husband's consent. She felt it would be extremely indecent to show her face, and we were obliged to satisfy ourselves with the assurance of her husband, that she was not worth seeing, and the great probability, that she would accidentally have dropped aside her veil if she had any hopes of exciting our admiration.—The singular state of society among these people will be illustrated, perhaps, by another trifling anecdote; for we were not a little amused during a sumptuous entertainment given us by a rich Persian, near Hamadan, having, in the course of conversation, asked our host how many children he had, to perceive him turn round to his servant for the necessary information.—*Alcock's Travels.*

Napoleon and the Voltaic Battery.—It is well known that Bonaparte during his whole reign, was in the habit of personal intercourse with the *sarans* of Paris, and that he not infrequently attended the sittings of the Institute. Upon being informed of the decomposition of the alkalies by Davy, he asked, with some impetuosity, how it happened that the discovery had not been made in France. 'We have not constructed a Voltaic Battery of sufficient power,' was the reply. 'Then,' exclaimed Bonaparte, 'let one be immediately formed, without any regard to the cost or labor.' The commands of the Emperor were, of course, obeyed; and on being informed that it was in full action, he repaired to the laboratory to witness its effect. On his alluding to the taste produced by the contact of two metals, with that rapidity which characterised all his motions, and before the attendants could interpose any precaution, he thrust the extreme wires of the battery under his tongue, and received a shock which nearly deprived him of sensation. After recovering from its effects he quitted the laboratory without making any remark, and was never afterwards heard to refer to the subject.—*Paris' Life of Sir H. Davy.*

Brevity the Soul of Wit.—Colonel S—e, of the Royal Marines, was always distinguished for the perspicuity and brevity of his speeches, of which the following is a specimen, which was delivered when going into the battle of the Nile.—Sir James Saumarez, who commanded the man-of-war to which he belonged, had, in a lengthened speech, wound up the feelings of the sailors to the highest pitch of ardor for the fight, by reminding them of the duty they owed to their king and country; and, though last, not least, he desired them to call to mind their families, their parents, and sweethearts, and to fight as if the battle solely depended on their individual exertions. He was answered by looks and gestures highly expressive of their determination; when,

turning to our hero, he said, 'Now S—e, I leave you to speak to the marines.' Col. S—e immediately directed their attention to the land beyond the French fleet. 'Do you see that land there?' he asked. 'They all shouted, 'Aye, aye, sir!' 'Now, my lads, that's the land of Egypt; and if you don't fight like devils, you'll soon be in the house of bondage.' He was answered by a real British cheer fore and aft.

Earl Fitzwilliam.—The following little story is so pretty in itself, and so creditable to both parties, that we cannot refuse it a place in our columns, though it has appeared elsewhere. A farmer called on Earl Fitzwilliam, to represent that his crop of wheat had been seriously injured in a field adjoining a certain wood, where his Lordship's hounds had, during the winter, frequently met to hunt, and he estimated the damage his crops had suffered at 50*l*. The Earl immediately gave him the money. As the harvest, however, approached, the wheat grew, and in those parts of the field that were most trampled, the corn was thickest and most luxuriant. The farmer went again to his Lordship.—'I am come, my Lord, to inspect the field of wheat adjoining such a wood.' 'Aye, my friend, did I not allow you sufficient to reimburse you for your loss?' 'Yes, my Lord, I have found I have sustained no loss at all, and have therefore brought the 50*l* back again.' 'Ah!' exclaimed the venerable Earl, 'this is what I like—this is as it ought to be between man and man.' He then entered into conversation with the farmer, asking him some questions about his family—how many children he had, &c. His Lordship then went into another room, and returning, presented the farmer with a check for 100*l*. 'Take care of this; and when your eldest son is of age, present it to him; and tell him the occasion that produced it.'—*Eng. pr.*

Matrimony.—The Virgin sends prayer to God, but carries but one soul to him; but the state of marriage fills up the numbers of the elect, and hath in it the labor of love, and the delicacies of friendship, the blessing of society, and the union of hands and hearts; it hath in it less of heany, but more of safety, than the single die; it hath more care, but less danger; it is more merry, and more sad; it is fuller of sorrows, and fuller of joys; it is under more burdens, but is supported by all the strengths of love and charity, and those burdens are delightful. Marriage is the mother of the world, and preserves kingdoms, fills cities and churches, and heaven itself. Cradles, like the fly in the heart of an apple, dwells in a perpetual swiftness, but sits alone, and is confined and dies in singularity; but marriage, like the useful bee, builds a house and gathers sweetness from every flower, and labor and unites into societies and republics, and sends out colonies, and feeds the world with delicacies, and obeys their king and exercises many virtues, and promotes the interest of mankind, and is that state of good things, to which God hath designed the present constitution of the world.—*Jeremy Taylor.*

GLUTTONY AND DRUNKENNESS.

The difference between excess in eating, and in the drinking of distilled or fermented liquors, is marked by the following among other lines of distinction. The one is the abuse of a good thing, and the other is the use of a bad thing. In the former case we take too much food, in the latter case we swallow near or less poison. Abstem should be taken with moderation, alcohol, however mixed, disguised, diluted or compounded should not be taken at all.

REMEDY FOR RINGWORM.

A correspondent in the American Farmer writes as follows. 'After I had the better nearly twenty years on my hand, and had used dollars' worth of celebrated tetter ointment, which took off the skin repeatedly without effecting a cure, a friend advised me to obtain some Blood-root, (called also Red root, Indian paint, &c.) to shew it in vinegar, and afterwards wash the part affected with the liquid. I did so, and in a few days the dry scurf was removed, and my diseased hand was as whole as the other.'

To Cure Hams.—A friend recommends the following receipt. He ate hams preserved in this way, in May last, and found them superior to any he had ever before eaten.—Take one pound of salt, one ounce of saltpetre, well pulverized and mixed, with about two quarts of molasses, rub the hams thoroughly with this mixture, lay them flesh side up, and let them remain for 18 or 20 days.—*Western Paper.*

Lynn Mineral Spring Hotel.

Ten miles from Boston, Six from Salem, and Five from Nahant.

The subscriber most respectfully begs leave to inform his friends and the public that he continues to keep that delightful Summer retreat, the Lynn Mineral Spring Hotel, which it will be his object to render a genteel and pleasant resort for Boarders, Parties of Pleasure, transient Visitors, &c.

The salubrious qualities of the waters of this celebrated Spring—the beautiful lake, on the borders of which the establishment is situated, abounding with fish of various descriptions, and surrounded with the most wild and romantic scenery—splendid Boats for sailing or fishing—Bathing rooms on the margin of the lake, where the warm or cold bath may at any time be taken—the delightful situation of the House, with its comfortable and well furnished apartments, with the fruit and flower Gardens adjoining, are attractions for those in pursuit of health or pleasure, rarely excelled if equalled in any part of the country.

Every exertion shall be made to merit a continuance of that patronage which has been so liberally bestowed. July 20. JAMES W. BARTON.

Perry.

For sale at the Agricultural Warehouse, No. 52 North Market Street—

A few dozen bottles of excellent Perry, of fine flavor and sprightly, well packed, and wired and sealed in champagne bottles. Price \$3 per dozen. Aug. 17.

Roses, Dahlias, Strawberries and Quicks.

The proprietors of the Albany Nursery have printed a classification of 140 of their finest Roses, according to color, to enable purchasers to select a variety with certainty and economy, with characters indicating the size of the flower, habit and prices. This may be seen at the office of the New England Farmer.

They have imported and propagated many varieties of the finest double Dahlias, which may be selected by the flowers until the frosts of autumn.

They will have for sale, at this time forward, plants of the Methven Strawberry, at \$2.50 per hundred.—Forty-seven of these berries have weighed a pound, and some have measured 4½ inches round. Also many other varieties, for which see catalogue.

They have also for sale, at \$5 per thousand, 50,000 quicks of the honey locust (*Gleditsia triacanthus*) for live fences, two years old, and fit for transplanting.—Specimens of the fence may be seen at the Nursery.

Orders for any of the above, or for trees, shrubs and plants, may be sent by mail, or left with J. B. Russell, BUEL & WILSON.

Albany Nursery, July 16, 1831.

NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, AT NO. 52 NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE.)—T. G. FESSENDEN, EDITOR.

VOL. X.

BOSTON, WEDNESDAY EVENING, SEPTEMBER 7, 1831.

NO. 8.

COMMUNICATIONS.

ASHES OF ANTHRACITE COAL, AND DISEASE IN LOCUST TREES.

To the Editor of the New England Farmer,

SIR—Allow me through the medium of your valuable Journal to ask the favor of some of your correspondents to inform me whether the ashes of anthracite coal are of any advantage to the soil, or if not, whether their use has been attended with any injury.

A satisfactory answer to this question would be very acceptable to those farmers, who, from their situation near navigable waters, find it to their advantage to use the above named fuel instead of wood.

The manner in which it should be applied, together with the quantity per acre, &c. would also be desirable.

My locust trees have this year been attacked with a disease in their foliage, which I do not recollect to have noticed at any time before; nor to have met with any account of it, in my agricultural reading. The leaf assumes a rusty color and dies. Will this affliction entirely destroy the trees. Or, if not, how great will be the probable injury?

Respectfully yours,

A SUBSCRIBER.

Greensburgh, N. Y. Aug. 23.

Remarks by the Editor.—We hope that some of our friends, patrons, or correspondents will be so obliging as to give the information solicited above. In the meantime we will state such as we can at present communicate, and should anything farther occur should be happy to publish it.

In Arthur Young's *'Farmer's Calendar'* published in London, 1809, it is observed that coal ashes are bought in small quantities in the neighborhood at 4d. per bushel, and collected to the land at about 1d. per bushel. They are distributed on the land with a shovel, from a cart or wheel barrow. Another, and perhaps the preferable mode, is sowing them by hand. The former way costs 12d. per wagon load, the latter 18d. Coal ashes are used from 50 to 60 bushels per statute acre for a complete dressing, which amounts to, from 23s. to 26s. per statute acre: they succeed well, sown on clover in March or April on dry chalk lands; and also do much good on sward, applied during any part of the winter or spring. They are never used on wheat. In very dry seasons coal-ashes do little good, on light land they require rain after being sown to set them to work.

It is observed in Kirwan's Treatise on Manures that 'sifted coal ashes, those of peat and white turf ashes, have been found useful, red turf ashes useless and generally hurtful.'

In the 6th volume of the New England Farmer, page 275, we published some notices of experiments on sea coal as a manure by Thomas Ewel, in which the writer, a physician and chemist of Philadelphia, says in substance that the common sea, pit or mineral coal, which is so abundant in the United States, when finely pulverized, might prove a useful manure; and 'that when powdered, its power in quickening the vegetation of corn and

wheat is much greater than any manure with which we are acquainted.' This writer, however, states nothing relative to the ashes of pit coal.

But a writer in the *Gardener's Magazine*, quoted, New England Farmer, vol. ix. p. 204 says that pit coal cinders were found by him to be injurious to flowers in pots. That 'On directing the attention of a horticultural friend to the circumstance, he related the case of a large garden in Scotland, which had been manured or coated over with coal ashes from a neighboring town two years in succession; which ashes though impregnated with the usual animal and vegetable matters displayed their deleterious effect both on fruit trees and culinary vegetables, not less than in the chrysanthemum pots. The gardener finding his fruit trees not to thrive so well as he expected, but attributing it to a different cause, took up a number of them and formed a substratum of ashes in order to lay them, as he said, dry and comfortable. The trees got worse, and were again taken up and the ashes removed; but such were the deleterious effects of the ashes already worked into the soil, that this garden which previously was, and now is one of the most productive in Scotland, was two or three years before even moderate crops could be raised.'

In *Loxton's Husbandry*, page 116, it is observed, 'It has been confidently asserted that stone coal is an excellent manure: that it has succeeded both in Europe and this country, therefore I am disposed to believe under favorable circumstances that it may be so.'

'I have tried it by top dressing, without any perceptible effect, on corn, wheat, red clover and the spear grasses, although the coal was pounded quite fine and sifted. This may have happened in consequence of the soil being impregnated with some of the properties of the coal as it frequently appeared near the surface throughout the whole neighborhood; or it might have succeeded, if it had been ploughed under the soil. There is also a great difference in coal; that used by me abounded in sulphur and bitumen, and burned freely.'

'The ashes from stone coal have been extensively used for manure at from forty to fifty bushels to the acre.'

Sea coal, or pit coal, either in substance or reduced to ashes is not enumerated among manures by Sir Humphry Davy. Dr Deane observed that 'ashes of sea coal is useful for cold and stiff land.'

This subject, however, requires farther investigation, and we hope will not be neglected by those who have the means of making experiments and the patriotism to publish such results as promise to be useful.

With regard to the disease in Locust trees, of which our correspondent complains, we are not able to give any useful information. Perhaps it is caused by the worm so destructive to those trees in this part of the country. Information on this topic would be gratefully received.

FOR THE NEW ENGLAND FARMER.

EFFECTS OF BUDDING.

MR FESSENDEN—In answer to a query in your last headed 'Budding,' I would observe that the correct theory is believed to be that the stocks are

not influenced by the character of the buds which may be inserted. The buds derive their nourishment from the stocks (as the stocks do from the earth &c.) and control the future growth of the tree above the insertion only.

Dedham, Aug. 19.

Remarks by the Editor.—There is some difference of opinion among horticulturists relative to the effects of grafting or budding. Miller says that crab stocks cause apples to be firmer, to keep longer, and to have a sharper flavor; and he is equally confident, that, if the breaking pears be grafted on quince stocks, the fruit is rendered gritty or stony, while the melting pears are much improved by such stocks. Lord Bacon, however, says that 'the scion overruleth the graft quite, the stock being passive only.' 'This last opinion' says the *Ed. Encyclopaedia*, 'as a general proposition remains true; it being evident, that the scion, bud or inarched shoot, is endowed with the power of drawing or forming from the stock that peculiar kind of nourishment which is adapted to its nature, and that the specific characters of the engrafted plant remain unchanged, although its qualities may be partially affected.'

But we never knew a question, except that proposed by our correspondent who favored us with the query respecting budding, page 35, relative to the influence of the bud on the stock. We are inclined, however, to believe that our friend from Dedham is correct; and should almost as soon think of a stream communicating its peculiar qualities to its banks, as a bud or scion having any influence on the properties of the stock to which it was attached.

FOR THE NEW ENGLAND FARMER.

MR FESSENDEN,—In the sheets of the *Revue des Revues* sent by Doct. Van Mons, is an interesting account of a process for making a cheap and very good kind of cheese; and as the experiment may be deemed worthy of repetition, by our agriculturists, I send you a translation for the New England Farmer. It is probable the process may be considerably improved, by the use of a press of some kind, which does not appear to have been applied, as in the mode practised by our dairy-women.

I have read your remarks on female industry, and think them generally correct. When the daughters of farmers can be well employed at home, that is the very best place for them; and if there is poverty, shiftlessness, vice, and no work to be done, within the walls of the parental dwelling, let them seek a better situation for earning a support, cultivating their minds and improving their morals.

You have treated this important subject of inquiry with candor, and that practical good sense, which characterises whatever you publish under the editorial head of the New England Farmer.

In this land of freedom all must work to live, and recollect the apothegm of Franklin, that 'God helps them, who help themselves.'

There are innumerable employments for fe-

males in the country. I called at a small house in a neighboring town a few days since, to obtain a glass of water. I found the snug apartments, neatly furnished, and such an appearance of thrift, that I was induced to investigate the cause. The tale was soon told. The little tenement belonged to a widow, who had two daughters, whose time was devoted to the manufacture of artificial flowers, for the New Orleans market. By this pleasant branch of industry they earned four or five hundred dollars per annum, and were consequently independent, respected, comfortable and happy, in the neat cottage, which was embellished with fruit trees and flowers, by their own hands.

It is most interesting and gratifying, to call at the houses on the road side, as we pass through the country, where a certain appearance of rural enjoyment strikes the eye, and ascertain the infinite modes, in which the various inmates earn a support. The variety of manufactures which claim the attention of the frugal mother and active daughters, is absolutely astonishing.

To know how our people *live and earn a living*, we must visit them at their own firesides. Industry, economy, and temperance, with a cheerful heart, and moral habits, triumph over all the hostilities of climate and soil. The rough features of this northern region are made to assume the delightful aspect of more favored climes. Labor, constant, unremitting and untiring labor, has given to New England the glorious appearance of universal prosperity. Freedom has pitched her tents upon the hills, and health and comfort reside in every vale. Let those who are ever looking on the dark side of the picture of life, contrast the condition of this people, with that of any other country, ancient or modern, and they must rejoice at the advancement rather than the decadence, of the human race; they must be proud of their countrymen rather than disposed to hunt up causes of complaints, and of perpetual denunciation. The good should be noted, when what there is of error, calls down rebuke. The everlasting cry of depravity will not eradicate the latter or augment the former. Unequalled disparagement, at all times, and in all places, bespeak a cold temperament, and an utter ignorance of the character of man; to elevate him, commendation is better than censure.

With the advantages of schools and religious instruction so abundantly afforded throughout the Eastern states, with a disposition to advance in fortune, intellectual acquirements, and reputation, the daughters of agricultural and mechanical parents become, in proper time, mothers of robust children, who are taught by precept and example to emulate the meritorious deportment of their progenitors.

But there is one striking fact, which may be considered as the test of our prosperity and the cause of our advancement in all the arts of civilization; it is the preeminent virtue of the families, of all ranks and ages. If the men were as distinguished for their rectitude of conduct, vice would soon disappear from the land; they are responsible for whatever there is of crime and licentiousness. Let them take counsel from woman, and imitate her morals and the prison and almshouse would become useless establishments. Misery would not exist, and joy and felicity become the inmates of every mansion. If woman is vicious, man has made her so, and the evils of his character fall upon his descendants, from generation

to generation. Woman is, in this country, the standard of excellence for the lords of creation, who have assumed a lofty position, but the power of command does not always insure respect. To merit distinction, they must endeavor to propitiate by kindness and insure commendation by practical morality; the times have gone by when to order was deemed a right, and submission ranked among the obligations of woman. She has a mind and has cultivated it; she is capable of deciding on the character and deeds of man and he must be ambitious to obtain her good opinion.

With unfeigned esteem, your most obedient servant,
U. A. S. DEARBORN.

EXTRACT NO. XXXVIII.

FABRICATION OF CHEESE FROM POTATOES.

In the Bulletin of the Société D'Encouragement, for the month of September, 1829, is an article on the fabrication of cheese from potatoes, of which the following is an extract, from the correspondence of M. Fabrenburg.

There is made, in Thuringe and in a part of Saxony, cheese from potatoes, which is very much esteemed; this is the mode of preparing it.

After having selected the best kind of potatoes, they are boiled; when cooled, they are peeled and reduced to a pulp, either by a grater, or in a mortar; to five pounds of the pulp, which should be equally fine and homogeneous, is added a pound of sour milk with a sufficient quantity of salt; the whole is well kneaded, then covered up and left to repose for three or four days, according to the season of the year; at the end of that time, the mixture is again kneaded and then put into small baskets, to drain it of the superfluous humidity. Afterward it is placed in the shade to dry and then it is packed in layers in large jars, or casks, where it is left for fifteen days. The older this cheese grows, the better it is.

There are three kinds made: the first, which is the most common, is prepared in the proportions above named; the second, with four parts of potatoes and two of curd; the third, with two pounds of potatoes and four pounds of milk.

The potato cheese has this advantage over common cheese, it never engenders maggots, and it keeps perfectly well for several years, provided it is placed in a dry situation and in close vessels.

I have repeated this experiment with the proportions of the second quality. This was the method pursued. The potatoes were boiled, peeled and crushed with the hands. If the fabrication was carried on extensively, the machine used for reducing the potatoes in distilleries, could be used. The milk was heated, and curdled with vinegar, as no rennet was at command. After this operation, the milk was mixed with the potatoes; the mass was salted, then it was passed through a hair sieve, to pulverise it thoroughly and make the mixture perfect; this mass, covered with salt, was left for ten or twelve days in an earthen pan; at this period it was distributed, for want of baskets, on sieves, where it drained and became moulded into regular forms. The sieves were lined with a linen cloth before the mixture was put into them. Fifteen days after this draining operation, which had been aided a little by pressure, the cheeses were placed, enveloped in their cloths, between osier hurdles and put into the cellar. At this time the caseous fermentation is well developed, the cheeses are yet very soft, and there is formed on the surface a skin of mould. The cheese taste

is very sensible, and not disagreeable, and I think this kind of cheese can be advantageously made by the farmers. I now intend to try playing the cheese in the shade. I shall publish the result of this experiment, which appears to me to be important to agricultural economy.

Horticulture.

Proceedings of the Massachusetts Horticultural Society, at a special meeting held in the Hall of the Institution, on Saturday, September 3, 1831.

The President read the following letter from the Hon. John Lowell, on an experiment to cultivate the Arracacha.

HON. HENRY A. S. DEARBORN,
Pres. of the Mass. Hort. Soc.

DEAR SIR—As the Society, of which you are the head, entrusted to my care three plants of the arracacha root, which is found so useful in the countries of which it is a native, I feel bound to state my own experiments on its culture. As Mr. Floyd of N. York attributed his all success to the want of shade, I put one of my plants in the shade and two in an exposed situation. The soil was admirable, my attention as great as possible, not a day passed without a visit from me.

Their growth was rapid and vigorous, every indication of health led us to hope full success, but when the heavy rains came on early in this month, they all three perished in succession, without the slightest appearance of injury from insects. What killed them is the true question. Not defect of heat—for from the 28th of May, to this day we have had by day and night at least tropical heat. Many countries within the tropics have not as great or as uniform heat. What was the cause of their death? I believe too great moisture. The countries in which this plant thrives are dry, much drier than ours. Though these plants were as vigorous as the beet and parsnip, yet their roots were not enlarged. One of them however threw out tubers from the top of the roots; these I shall preserve. I am by no means be satisfied that planting the tops of the old roots is the best mode of propagation. On the whole I am constrained to say that I fear the arracacha is a plant as much placed out of the useful class of vegetables in this climate as the pine apple is a fruit.

I am, dear sir, respectfully, your humble servant,
JOHN LOWELL.

N. B. It would seem probable, that Gideon R. Smith, Esq. the intelligent and active Editor of the American Farmer, would succeed in ripening the seeds of the arracacha. It is possible that it may do better from seed and it is even probable that from seed raised in Baltimore more healthy plants may be grown. It is almost incredible what perseverance has done towards acclimating both plants and animals.

Permit me to add one further remark which I think of the highest importance. When gentlemen of the Navy and other friends to the horticulture of the country bring us seeds and roots, it is not only important but essential that they should accompany them with statements of the soil in which they flourish and the treatment or culture which they receive.

In the defect of this we may be administering to them their poison instead of their aliment. What should we make of the rice plant or of the Taro root of the Sandwich Islands if we denied the water so essential to their growth?

J. LOWELL.
Roxbury, Aug. 20, 1831.

A sample of Lucerne Grass was presented by J. Swett, Esq. accompanied by the subjoined communication.

HENRY A. S. DEARBORN, Esq.
Pres. of the Mass. Hort. Soc.

SIR—I take the liberty to send to the Horticultural Hall a small bunch of Lucerne Grass for the inspection of those members that may be present. This grass is of the fourth crop this season, and according to my best estimate has produced at the rate of about 3000 lbs. per acre each crop, when dried. I have raised this grass for the three last years and find that my horses and cows like it much. I prepare my land in the following manner: have it ploughed twice, harrowed well, and all the weeds and rubbish taken from the land, then sow about 30 lbs. of seed to the acre. I have laid down three small pieces of land with this valuable grass and have succeeded every time to my perfect satisfaction.

J. SWETT.

Dorchester, S. pt. 3, 1831.

The following letter was read and the Bust of LINNEUS placed in the Hall of the Association.

To the Sec. of the Mass. Hort. Society.

SIR—Our friend Mr Russell will hand you a box containing a Bust of the immortal LINNEUS which we imported from Paris, for the purpose of presenting your valuable Society as an ornament to their dinner table or flower stage on the approaching anniversary, after which place it in your council chamber.

It is believed to be a striking likeness—was moulded from the celebrated fine bust at Upsal.

With respect, your friends,

G. THORNBURN & SONS.

New York, Aug. 27, 1831.

Resolved, That a general committee of arrangement, for celebrating the approaching annual festival, be chosen, and that the nomination be made from the chair.

The following gentlemen were unanimously chosen: Zebedee Cook, Jr., Abbott Lawrence, George W. Pratt, Elijah Vase, Cheever Newhall, Charles Lawrence, Salem, H. A. Breed, Lynn, E. W. Payne, E. H. Derby of Salem, JEO. Winslip, Brighton, Charles Tappan, Charles Senior, G. W. Brimmer, Daniel Chandler, Lexington, David Haggerston, Samuel Downer.

Resolved, That the thanks of the Society be presented to Messrs G. Thornburn & Sons, for a bust of LINNEUS presented by them to the Society.

James K. Mills of Boston, Hall J. Howe, James Vila, Thomas Melville, Daniel Gould of Readings, were admitted members.

Adjourned to Saturday, Sept. 10.

Horticultural Hall, }
Saturday, Sept. 3, 1831. }

FRUITS EXHIBITED.

Apples.—By Dr Robbins of Roxbury, specimens of the small fine Crimson apples exhibited at former meetings and a beautiful specimen of Porter Apples.

By Mr E. D. Dyer, large striped apples of very handsome appearance but not in eating, name unknown.

By Mr Geo. Brown of Beverly, a specimen of Gloria Mundi.

By J. C. Magoun of Medford, Early Sweet Apples seen on one stem and very fair.

Pears.—By John Prince, Esq. specimens of Andrews, Capiaumont and Boston L'Epergne now called Harvard, all very fine and fair.

By Mr Thos. Donnie of Boston, specimens of the Late Green or Spice Catherine a very productive fruit.

By Mr Swett of Dorchester specimen of the Juliette which we characterized on a former occasion.

By Mr Whitmarsh, Brookline, specimens of a green pear, name unknown, and the Mogat Summer a large pear, handsome, productive, sweet, but not abounding in juice.

By Mr P. B. Hovey of Cambridgeport specimens of Harvard Pears.

By Mr David Dudley of Roxbury, fine specimens of the favorite Bartlett Pear.

By Mr A. D. Williams of Roxbury a sample of a native fruit which originated on his farm: size under medium and in form pyriform, and much like a Capiaumont, color yellow with a blush on the sunny side, and of exceeding fine flavor: The Committee recommended that this fruit be called the Williams Pear.

Peaches.—By Mr E. M. Richards samples of excellent native Peaches.

Grapes.—By Mr B. V. French from his garden in Braintree, several large and handsome bunches of Sweet Water and Golden Chasselas.

By Mr J. Ames of Boston very large and fine bunches of White Chasselas.

By Amos Perry of Sherburne, specimens of White Native Grapes, very sweet.

By Dr John Williams of Cambridgeport, specimens of Native Grapes of good flavor.

By Col. John Wilson of Deerfield, specimens of a native grape called Mather and of another native called Magnolia, one of medium size and the other very large and both very sweet.

The character of all our Native Grapes of New England so far as we have seen them here exhibited is much the same.

Per order of the Committee, WM. KENRICK.

VEGETABLES.

Mr A. Houghton, Jr. Lynn, presented a fine specimen of sweet potatoes, raised by him.

D. CHANDLER.

SAMUEL DOWNER, ESQ.

Chairman of the Committee on Fruits and Fruit Trees,
Massachusetts Horticultural Society, Boston.

MY DEAR SIR—In conformity to your request, I have drawn up a succinct account of the tree which produced the pears, recently submitted to the committee on Fruits, for examination.

Some twelve years since, I discovered a young seedling pear tree, in the border of the avenue, which divides my front yard. It came up amidst a cluster of Syringa and Rose bushes, and when it was about five years old, I concluded to transfer it to the nursery, as a stock for budding. After removing the earth, for over two feet in depth, it was discovered that there was but a single tap root, which apparently extended as much farther at least; and being apprehensive that an attempt to deplant it, might occasion such mutilation as to render it doubtful, whether it would survive the operation, I directed the earth to be replaced, concluding to let it remain, until it bore fruit.

The shrubs which surrounded it were removed, and the tree grew rapidly; but as it was inclined to shoot up tall and slim, I headed it down so as to leave it about eight feet high. It is now twenty feet in height and ten inches in diameter. It has never been pruned except by cutting off two small branches which projected into the avenue. It being so little filled with wood, and the form regular,

there has been no occasion to attempt improving the appearance or bending the tree by pruning.

There can be no doubt that the plant sprang from a seed, accidentally dropped, as there was no pear tree in the vicinity, or could there have been for many years, if ever, as upwards of twenty years since, when my father purchased this seat, there were eighteen Lombardy Poplars growing in the front yard, to the exclusion of every other tree. They were at least a foot in diameter, and after being dug up by the roots, the whole area was trenched, manured and planted with ornamental trees, shrubs, and flowers.

The tree is of vigorous growth, tall for its age and the size of the trunk, branches long, rather slender, extending horizontally, to within eighteen inches or two feet of the ends, which are turned upwards perpendicularly. The bark of the annual shoots is brown freckled with small grayish dots, that of the preceding years' growth and of the trunk of a dusky green.

The leaves are ovate, short, rounded at the base and pointed at the other extremity, finely serrated, smooth, borders undulate, bright green, paler beneath, nerves conspicuous.

The fruit is of a medium size, rounded at the blossom end, largest midway its length, and regularly diminishing in a parabolical manner, to the peduncle, which is inserted in a small cavity, but little depressed, the eye slightly sunk, leaves of the calyx not very prominent.

Skin smooth, thin, green, sprinkled with russet points, and a fawn colored blotch about half an inch in diameter round the peduncle, which is short and commonly bent. Within three or four days before the maturity of the fruit, it begins to acquire a lighter green and when fully ripe becomes a delicate yellow.

Last year there was a cluster of blossoms near the end of a lower branch, which produced one pear; this year the tree has borne thirtyfive.

The fruit began to ripen on the 12th, and the last were mature on the 30th of August.

The qualities of the fruit I have not presumed to describe, that being within the especial province of the Committee, of which you are Chairman.

Annexed is an exact profile of one of the pears with its dimensions. Very respectfully, your most obedient servant.

H. A. S. DEARBORN.

Length 2½ inches, diameter 2 inches.

Silk and silk Worms.

From the Lowell Journal.

SILK MANUFACTURE.

NO. II.

The culture of silk, has, from the first colonization of this country, more or less engaged the attention of the American people, yet nothing has resulted from it beyond the fabrication of an inferior kind of sewing silk, which can only be applied to domestic uses. Those who have written on the subject have in vain attempted to discover the causes of this failure. It appears to me that the whole may be referred to one single cause—the want of knowledge of the art to transform the produce of the American silkworm into a saleable article. Cocoons, it is well known, cannot be transported across the ocean; for in 10 or 15 days they become mouldy, and are of no value. Therefore it is necessary that the silk should be extracted from them, before it can be shipped to those countries where it is manufactured. But that cannot be profitably done without a perfect knowledge of the art of reeling it, to suit the various kinds of stuffs to be made out of it, and that art, simple as it may appear, requires much time and labor to acquire, in order to make the material fit for sale. So long as the art of making *exportable* silk shall not have been introduced into the country, there will not be sufficient inducement for the American farmer to attend to the production of silk worms.

Why is the best silk employed and turned into sewing silk, for which there is always waste or inferior silk enough, and why is not the best silk kept for the loom? The answer is obvious—because the people do not know how to prepare it in any other form, so as to make it fit for sale.

We have great confidence that the enterprising and distinguished patrons of domestic industry and American manufactures will not omit this favorable opportunity for erecting the necessary machinery to prepare the raw silk for foreign markets. If a Filature shall be erected at Lowell, they may purchase and prepare for market, all the cocoons in New England, and thereby supersede the erection of similar machines. The industrious farmers of Connecticut are extending their plantations of mulberry trees to an almost unlimited extent; and will be compelled to erect a filature in that vicinity; unless there shall be one erected in some neighboring State where they may find a market for their cocoons.—One gentleman on the banks of the Connecticut river has planted the present year two hundred and fifty-six ounces of white Italian mulberry seed, from which he will grow several millions of trees, and his neighbors are following his example. The facts within the knowledge of the writer of this article justify him in the opinion, that thirty millions of trees will be produced the present year, in addition to the large stock on hand, in the small state of Connecticut. This fact should not discourage our farmers from commencing their plantations, for if each state in the Union should produce one hundred millions of trees, the demand for raw silk could not be satisfied. V.

From the Evening Gazette.

SILK WORMS.

We recently witnessed the operation of over 4000 silk worms at the seat of NATH'L. DORR,

Esq. in Roxbury—and must confess that we never before felt the least interest in this important branch of Natural Economy, until we saw these busy bodies at work. It has led us to read and reflect a little upon this subject.

The two following articles are taken from the Baltimore Chronicle of the Times, which is edited by Professors DECATEN and SALVET, of the University of Maryland—and presents a short, but interesting description, of the management adopted in the establishment of M. D'HOMERGUE, of Philadelphia, and also some account of the *Native American Silk Worms*, in the following account by the editors.

We have lately taken occasion, during a visit of a few weeks to Philadelphia, to visit the Silk spinning establishment of the venerable P. S. Du Pontecau, Esq. The establishment is directed by Mr D'Homerque; and though small, sufficiently extensive to enable its founder to attain the object which he had in view—namely, to satisfy himself experimentally of the degree of skill required to learn the art of silk spinning.

A short description of the arrangements adopted in the establishment under D'Homerque's directions, may be acceptable to our readers. It consists in a shed thirty-six feet long by twenty in breadth, running north and south, the eastern side entirely open, the western exposure but partially closed, having six large sashes usually let down, in order to permit the free circulation of air so essential to the operations to be performed. The entire apparatus and machinery of the establishment consists of ten furnaces built up in masonry, with grates for burning charcoal, and copper basins for heating the water in which the cocoons are placed, and made to connect during the spinning operation, with the reels. These are constructed in the most simple manner.—Each system of apparatus and machinery is attended by two females—the spinster, and a little girl who turns the reel. The spinster takes her situation next to the furnace; she is provided with a basin of cold water into which she dips her fingers, after every immersion of them in the hot water in which the cocoons are placed. Her duty is to prepare the cocoons by wiping them for a short time in the hot water, and supplying them with the number of threads to the reel. It is this operation, which, although extremely simple in appearance, is attended with difficulties in practice far greater than we had any idea of. We have satisfied ourselves by close examination, by inquiries from the females, who are now spinning for the second year, and by the full and precise explanations which were given to us by Mr D'Homerque himself, that the art of spinning silk *is* uniformly good quality is a far more difficult acquirement than has been sometimes stated, and is generally thought.

From these considerations, and a conviction of the importance to our country of the raising of silk worms, and the manufacture of its invaluable product, we have no hesitation in subscribing ourselves as the decided advocates of the plan submitted by Mr Du Pontecau, to congress after their request—namely to appropriate a sum of money for the thorough instruction of sixty intelligent young men in the art of spinning silk, under the direction of Mr D'Homerque. We have the greatest confidence in Mr D'Homerque's intelligence and abilities; we feel the warmest gratitude for Mr Du Pontecau's patriotic exertions—his sacrifice of time

and money—in convincing our fellow citizens of the importance of this new branch of industry, and providing for our country, the means of securing its benefits.

We have the additional gratification of being able to state, that the raising of silk worms has considerably increased throughout the United States, and that the farmers of Pennsylvania at least, have satisfied themselves that it gives rise to a profitable employment. The cocoons which were sent to Philadelphia during the last season were purchased by Mr Du Pontecau at 40 cents per pound. While on this subject, to which we hope to have occasion to return frequently, we will call the attention of our readers to an interesting article on Native Mexican Silk Worms, for which we are indebted to a highly respectable correspondent.

NATIVE AMERICAN SILK WORMS.

[Translated for the Chronicle of the Times, from the Registro Oficial, Official Register of the United Mexican States, of the 15th February, 1921.]

The following letter has been addressed from Jalapa to the Board of Directors of the National Industry:

"The quantity of wild Silk produced by the immense forests of this State, is truly astonishing.—The worms which produce it, feed on the leaves of the *guayaba*, an evergreen with small leaves, or on those of the oak; but the finest silk is that of the worms which feed on the former.

These worms, in my opinion, are those which a Chinese author describes by the name of *Tusen-Kyen* or *Tyan-Kyen*, which are raised in that country, and with this silk they make the stuffs which they call *Kyen-Chen*, which is handsome drugget, and so much esteemed that sometimes it sells as high as the first tissues of China.

The natives of this State gather that silk in the month of March; they take off the large bags with which the cocoons are covered, leaving them exposed to the air during four days, after separating from the tree the branches which contain them, in order to free them from imperceptible thorns, left there by the skin of the silk worms, and after cleaning them (as will be seen by the samples sent here with,) they spin the silk and make girdles therewith, (of which a sample is sent,) which last fifteen or twenty years in daily use; the strength of these girdles is such, that one having been tied to the horns of a wild bull, resisted his efforts for more than twenty-four hours, which was thought a sufficient trial.

They make here no other use of this beautiful silk, and no pains have been yet taken to bleach it, before or after it is manufactured. This silk is gathered in this state by the Mixten Indians, who come down in the month above mentioned, and also cut off the honey combs from the wild bee hives, and collect in abundance the honey and wax which they produce.

In the vicinity of this city the trees begin to be covered with that valuable Silk, and in the districts of Dosamalsapan, Alvarado, and Acocoyenn, and in short in all the finest forests in this State, in which are found the trees above mentioned, it is produced in great abundance.

The worms have for their enemies certain birds of the size of a tame pigeon, of a gray color, and is known by the name of *Pepe*, because its whistling imitates the sound of that word; they seat themselves on the branches where the bags are

hanging, peck at and pierce them, and devour the useful little animals.

These worms begin their work at nine o'clock at night; then they come out of their bags, and begin to feed; in their passage they draw long silk threads, which serve them as guides to return to their cocoons; thus they make to themselves silken roads or bridges, the threads of which are of an extraordinary strength.

By Mr Ienza, now in this city, I shall send you a cocoon bag of the material above mentioned, and if the Board desire it, I shall send them as many as they may think proper.

God and Liberty—Jalapa, Jan. 6th, 1831.

TOMAS ILLANES.

NEW CHINESE MULBERRY.

Morus Multicaulis.

This newly introduced variety of mulberry for feeding silkworms is undoubtedly an important acquisition, and more particularly so to this country where silk is on the eve of becoming a staple article of production. The Editor of the American Farmer has had this variety under cultivation for two years, and has made himself acquainted with its peculiarities both as to quality and the manner of cultivating it. Not having a sufficient quantity for a full trial of feeding silkworms with it, he has been obliged to confine his experiments to occasional feedings, at which times the worms promptly left the Italian white mulberry leaf and devoured the new Chinese with avidity. The leaves of the new mulberry frequently measure a foot in length and ten inches in width. Indeed Mrs Parmentier, the lady of the late Andrew Parmentier of the Brooklyn nursery and garden, who has 1600 of the trees for sale, in a letter to the Editor says, that some of the leaves on the trees in that establishment measure 13 inches in length, and that the worms left six different kinds of mulberry to feed on them. Although the number of leaves on the tree is not so great as that of those on the white, we should judge that the weight of the leaf was much greater—it is so great in fact that during a rain or after a heavy dew, the young trees are bent almost to the ground by the weight of their foliage. This mulberry bears no fruit, or rather it is so minute and so small in quantity that the propagation of it from seed is never practised. But like all other vegetables of difficult propagation by seed, it is remarkably easy of reproduction by other means. By laying down the young trees, covering them with earth, and leaving the ends of the branches out, every branch will take root and become a young tree in two or three weeks—so that every tree one year old will by proper management produce from ten to twenty in one summer. We laid down a tree on Friday, 29th July, and a part of the stock near the root containing no branches, was left out of ground. On the Friday following two buds were seen shooting from the naked stock, and earth was then covered over the stock and around the buds. The young trees from these buds now measure 2 feet 6 inches high. This fact will serve to illustrate the great facility of propagating the *morus multicaulis* by layers. As this mulberry does not grow high, the leaves can always be gathered by hand from the ground without the aid of ladders or the danger attending the climbing of large trees. They can be planted pretty close together, and we should judge that an acre of ground would produce more foliage with this than with the white mulberry. The *morus multicaulis* being as yet quite

scarce in this country, they sell high; but every one who contemplates cultivating silk should obtain a few, and by laying them down in July, multiply them. By this means ten trees obtained this fall, would, in five years, produce one million of trees, allowing each one to produce ten every year, which we are convinced they will certainly do; that is, in the fall of 1832 there would be 100; 1833, 1000, in 1834, 10,000; in 1835, 100,000; in 1836, 1,000,000—and these we have no hesitation in saying would produce ten times as much foliage as could be produced with the same expense and labor in the same time, of the white mulberry or any other kind. We hope editors in the country will give free circulation to these facts, that the cultivators of silk, and those who contemplate entering upon that business, may avail of the advantages of this mulberry in commencing their orchards. The *morus multicaulis* can be obtained of Wm. Prince & Sons, at the Linnaean Botanic garden at Flushing, New York, of Mrs Parmentier, at the Horticultural Botanic Garden at Brooklyn, N. Y. of the Editor of the American Farmer, and of the New England Farmer, Boston. They are generally sold at one dollar each.—*American Farmer.*

A letter from Commodore Porter to Mr Skinner of Baltimore says—I shall try and send you a very simple mode of cultivating the silk worm, preparing the silk, and adapted, in the most simple form, to the use of families. I shall get it from a poor plain Mahonese woman, who, for her amusement, raises the worm, separates the silk from the cocoon, spins and manufactures, and sells it. She showed me several pounds of excellent sewing silk, of the remains of what she had last year. I shall send you a sample. You will be surprised at the simplicity of all the means of obtaining silk, and of the little trouble attending it.

The cultivation of silk is not as troublesome as the cultivation of flax, and infinitely more certain and profitable. The simple mode, which I hope to be able to describe, will, I expect, induce our good housewives to give some attention to the subject, and, by a gradual introduction of its culture among us, save, in the end, millions of moneys which finds its way to this side of the Atlantic. For silk is an indispensable article, and is one of the first necessity; as much so as tea and sugar. No man or woman can put on a coat, shawl, hat, glove, or dress himself, or herself, in any way, without it.

THE MORTGAGED FARMS IN NEW ENGLAND.

We intended to accompany the article under this head in our last, with some remarks; and even now, they seem necessary to satisfy the demand of justice. In the first place, the evil, though of no trifling magnitude, is by no means so universal as the writer supposes,—at least, in this region; and we believe it is, and for some time has been, diminishing. Farmers are getting out of debt. They are paying off their mortgages, either from the produce of their farms, or by the sale of them, generally, to farmers who will manage them independently. Then, too, the alleged cause of the evil, the unprofitableness of farmers' daughters, is overrated. We know but few families where they spend their time in such idleness as the writer supposes. Again, he is wrong when he supposes that their 'going out to service' would mend the matter to any great extent. A writer

in the N. E. Farmer has some very good remarks on this subject; but he has not touched some of its most important points. The very phrase 'going out to service' is very unacceptable to our farmers, and their daughters too, and we hope it always will be; not because there is anything so bad in the words themselves, but because the aristocracy of England have given them a technical meaning, which clings to them even here, expressive of distinction in rank, of superiority and inferiority, in a word, of *degradation* in those to whom it is applied. Many a farmer's daughter labors willingly at moderate wages, in the kitchen too, if need be, in families like her own, where she is regarded as an equal, who could not be induced, at any price, to do house-work in a family where she must be regarded as an inferior; for she will not, for money, give up her habitual, every day consciousness that 'all men,' and women too, 'are born free and equal,' and that neither her parents nor herself have forfeited that birthright. And when this spirit is gone, our republican institutions will have become inappropriate, and ought to give place, and soon will give place, to a form of government more in keeping with the spirit of the people. Let our 'gentry' have as little intercourse as they please with those by whose labor they live, but let that intercourse be such as implies no degradation in either party, and they will find no difficulty in purchasing the labor of intelligent and virtuous young women, who will feel self-respect enough to mind their own business.

The writer in the N. E. Farmer says that the evil complained of arises from the accumulation of property in a few hands. But whence does this arise? How does property get out of the hands of the farmer or mechanic, into the hands of the merchant, for instance? Evidently, by the farmer's buying more than his income can pay for. It is the desire to keep up an equality of outward show, by running into all the expensive follies of the foolish rich, that does more than all things else to mortgage farms. Whether all the aforesaid daughters are as guiltless on this point as on the other, we shall not attempt to decide.—*Hindsor, Vt. Chronicle.*

From the American Farmer.

ARACACHA AND QUINOA.

The importance of the introduction of these new and valuable vegetables, will be deemed a sufficient excuse for the frequent mention of their progress, in the Farmer. The aracacha continues to thrive most luxuriantly, and at present is one of the most flourishing vegetables in the Editor's grounds. It has withstood all the varieties and excesses of the season without detriment, and is not surpassed in hardiness, so far, by any other vegetable. The root is growing and the offsets for another year's planting are forming in great numbers. The prospect is, that it can be cultivated with much more facility in this climate than the sweet potato.

The Quinoa, or Peruvian rice, is just out of flower, and is thickly set with seed, so that unless some unforeseen injurious effect of the remainder of the season should occur, the prospect is very fair that it will be perfectly adapted to our climate and become an important addition to our grains. We shall take care to advise our readers of the result of this experiment, whatever it may be.

THE NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, SEPT. 7, 1831.

GRAPES IN THE OPEN AIR.

We were lately gratified with the view of fine grapes growing on the grounds of Mr Charles Tappan in Brookline. Most of these grapes were nearly and some of them were quite ripe; and were of several different species, foreign as well as native; and we were pleased to observe that none of them were in the least degree injured by *mildew*, the great enemy to that delicious fruit in our climate. We of course supposed that the solutions of lime and sulphur, pulverized sulphur, or some other of the applications recommended as remedies for mildew had been profusely administered to these spotless vines and their perfect fruits. But Mr Tappan informed us that nothing of the kind had been applied, that neither powders nor washes had blurred or brightened the beauty of his vines, nor checked nor excited the exuberance of their fertility. Mr Tappan attributed their exemption from disease to their location on *high ground*, where the air was pure and unconfined. Indeed it is a question worth consideration, whether we may not give our vineyards *too much shelter*, so that they lose more for want of air than they gain by protection from the dampness, fluctuations and inclemencies of the seasons.

Esplanade-rails standing in open ground, are said by some horticultural writers to be better for training fruit-trees and vines upon than walls, because the foliage and fruit are more fully exposed to *light and air*, when suspended from the lattice work of rails, than when resting on air tight supporters. And an espalier has another advantage over a wall tree or vine, viz. being wholly detached the branches have liberty to form fruit spurs on *both sides* which in the wall tree can be affected only on *one side*. Besides in wet seasons an exposed plant may be benefited by shaking off the redundant moisture by the wind, and it is asserted by some physiologists that the agitation of the leaves and stems by currents of air serves as *exercise* to plants and that plants require exercise as well if not as much as animals.

If this theory be correct, hill tops instead of sheltered valleys are proper sites for the vine; and our country friends possess advantages for raising grapes which can scarcely, if at all, be found in the gardens of Boston.

FARMERS' WORK FOR SEPTEMBER.

It is well about this time to be particularly attentive to the cattle and sheep, which you intend to fatten for market or for domestic consumption. When an animal is nearly fattened he becomes somewhat nice and notional about his food; and although he will not require so much in quantity as when he was lean, what he does condescend to feed upon must be of the best quality. Grass will soon decline, and it will be advisable with regard to your fattening cattle and milch stock to make a liberal use every morning and evening of cabbage leaves, strippings of mangel wurzel, or lucerne, cut and supplied by hand by way of soiling. Or if you are not provided with these articles, or something which will answer as their substitute you may feed them with pumpkins, green corn, boiled or steamed potatoes, with a little Indian meal stirred into their pottage, seasoned with a little salt.

It is not advisable, when it can well be avoided to turn fattening cattle into mowing land, to cut the rough; for if rough is turned into in September you cut off one of the best resources for sheep and lands in the spring. It is believed that a second crop of grass in most cases, when it is sufficient, luxuriant to afford as much as half a ton to an acre had better be cut for feeding sheep, &c, in the prings than fed off by fattening cattle.

LUCERNE FOR MILCH COWS.

Mr Arthur Young says, 'The dairy of cows must have plenty of grass throughout the month of September or their milk will be very apt to fail. Lucerne, mown green, and given them in a yard, is the most profitable way of feeding; the product is so regular, that it is an easy matter to proportion the dairy to the plantation, and never be under a want of food; for lucerne mown every day regularly, will carry them into October; and although some persons have asserted that cows will not give so much milk thus managed, as when they range at large, and feed how and where they will, it is not a matter of inquiry; because if they give less, the quantity will pay more clear profit, than more produce would in the other case; there may be some inferiority; but the cows are kept on so small a quantity of land, that there remains no comparison between the methods for profit.'

But however doubtful this matter might once have been, it is so no longer; and the experiment of the cows kept at the goal of Lewes by Mr William Crump, has decided the matter beyond all question; a produce of from 50l. to 70l. per cow, should forever put to silence the silly objections which have been made to this practice.'

It may be observed that those observations of Mr Young are better adapted to the husbandry of Great Britain than that of this country, where pasture is, in general, more plenty and labor more scarce. But the cultivation of lucerne for soiling in the vicinity of large towns, may be advisable for those who furnish milk to their inhabitants, and may enable some to keep cows, who, without the aid of that excellent grass, would be obliged to dispense with the services of that most useful of domestic animals.

SINGULAR FACT WITH REGARD TO FIGS.

Mr FESSENDEN.—The following unquestionable fact may be interesting to those, who are fond of physiological inquiries, though it will be of little practical use in New England, where the fig is very rarely grown. Having read in the American Farmer, a letter from a gentleman in Florida, stating, that the ripening of figs could be surprisingly hastened, by the application of sweet oil to the flat, or as it is called, the drop end of the fruit, I resolved to try it on a tree, in my lot house, then covered with unripe figs. The fig like the fruit of the vine, and peach, attain a certain size, and then remain stationary for several weeks, until it begins to color, when its volume, in three or four days, is greatly increased, often doubled, and even trebled.

My figs were dark green, showing no tendency to ripen. I took about a third of a tea spoonful of sweet oil, and dipping my finger in it, I rubbed it very slightly over every alternate fig, leaving the others untouched, as a test of the effects. At the end of 3 days, the color of most of those touched with oil began to change, and the size to increase, and now on the fifth day they have nearly the

color of mature figs, and are twice and three times as large, as those not touched with oil, which still remain of a dark green color.

It has long been familiar to Horticulturists, that wounding the fruit of the fig, by a sharp instrument, accelerates its ripening, as other fruits are prematurely ripened by the depredation of insects; but the philosophy of it has never been satisfactorily explained. The fact now proved is as difficult of explanation. No doubt rash men will be found, who will pretend, that the *modus operandi* is quite clear to their favored minds, but for myself, I am contented with clearly settling the fact and admiring the inscrutable operations of nature. It is possible, that this curious fact may lead to some other practical uses as to other fruits.

Rochury, Sept. 2, 1831. JOHN LOWELL.

SWEET POTATOES.

Mr RUSSELL.—I send you with this a few Sweet Potatoes, raised from slips purchased at your seed store last spring. I am well satisfied from three years' successful experience, that they can be raised with as much ease and certainty as the common potato. I used no manure in their culture, but sand. They are not a sample of what I expect my crop will be a month hence—I have used them in my family, nearly every day, since the seventeenth of August, and consider them the best vegetable I can raise in my garden.

Your new *Horticultural Pole Bean* has proved far superior to any shell bean, I have ever seen or cultivated, both for quality and yield. The yield from them is immense. I have given some to my neighbors to try their quality, all of whom fully concur with me that they are superior to any Bean heretofore cultivated.

Yours, &c. A. HOUGHTON, JR.

Lynn, Sept. 3, 1831.

Mr Houghton has our thanks for his present—the potatoes have proved, on trial, certainly inferior to none brought from the South.

BUDDING.

Mr FESSENDEN.—In the New England Farmer of the 31st ult. I observed the praiseworthy invitation of the Messrs Winslips, to the members of the Mass. Horticultural Society, to call on them and receive buds of valuable fruits.

They observe that 'The Scions sent from Henry Corse, Esq. of Montreal, are all living with one exception (the 'Admirable') here is probably a misprint; 'Admiral' is the name given by Mr Corse.

I have the satisfaction to state that I received one scion of the 'Admiral,' sent by Mr Corse, which has made a fine growth and which is at the service of the members of the Mass. Hort. Society, the Messrs Winslips in particular.

I would also observe that members of the Society wishing to procure Peach buds from 'Circumcised' branches, may find a pretty good assortment in my garden.

Yours, &c.

O. PETTEE.

Newton Upper Falls, Sept. 5th, 1831.

Gen. H. A. S. Dearborn and Thomas Nuttall, Esq. of Massachusetts, have been elected honorary members of the South Carolina Horticultural Society.

TO CORRESPONDENTS.—Several communications are deferred till next week.

New England Farmer's Almanac for 1832.

Just published by J. B. Russell, at the office of the New England Farmer, 52, North Market Street, and Carter, Hurdie & Birchbeck, Washington Street, the New England Farmer's Almanac, for 1832, by T. G. FESSENDEN, Editor of the New England Farmer—the Astronomical calculations by ROBERT T. PAINE, Esq. Sept. 7.

Auction.

Farm, Stock, Utensils &c. To be sold at public auction on Tuesday, Oct. 11, at 11 o'clock A. M. on the premises the well known Farm situated in West Newbury, called the Carr Farm, containing about fifty-five acres of most excellent land, with a good two-story house and out buildings, well fenced and watered; it is about one mile from the church in the 1st parish, and about the same distance from Indian Hill Farm, on the road leading from West Newbury to Byfield, Rowley, Salem, &c., and five miles from Newburyport. On the highest part of the land the view of the Merrimack River and the landscape view in every direction is very beautiful. West Newbury as a town has increased remarkably within the last ten years. Taxes are low, (it being an inland town) and the society very good, as almost every residence is owned by the occupant. Title indisputable. Half the purchase money may remain on mortgage at 6 per cent if desired.

Also, immediately after the sale of the Farm, a valuable stock of Oxen, Cows, Horses, Swine, Blood Mares and their Colts, 1 pair Horses well matched in color, &c. 1 pair Colts three years old next spring. Also, 1 superior new ox cart, with 4 pint huls, &c.

A great variety of other articles, catalogues of which can be obtained two weeks before the sale, at the printing offices of these newspapers that publish this advertisement, and also of Mr. Cary, at the market house, Newburyport, and the Auctioneer.

Conditions (which will be liberal) made known at the sale.

Sept. 9. JOHN E. BARTLETT, Auctioneer.

Milk Establishment.

For sale, a Milk Establishment, comprising a stock of 20 good cows, 2 horses, two wagons, cans, coolers, &c., and a cun-ton of 100 quarts per day—the whole will be sold together or divided, and offers an excellent opportunity for any one wishing to engage in the business. Apply immediately at No. 56, Commercial street.

Sept. 7. epi-tf

Notice.

The subscriber, expecting to leave this city about the 10th of this month, on a tour as far as Bangor, in Maine, and even to Eastport, if business will warrant it, visiting the principal towns in that State, and others on the way from this city to Maine, as a Collecting Agent for this paper, Patriot, Daily Advertiser, Boston Courier, Columbian Centinel and Palladium, Boston Commercial Gazette, and others in this city, and would be glad to transact any business that may be entrusted to him by publishers of Periodicals or others. After my return, I expect to go south as far as Washington City, and could make returns there or otherwise as directed. Having leave to refer to the editors of the above named papers, would respectfully solicit communications directed to the Patriot Office, Boston. LEMUEL TOMPKINS.

Sept. 7.

Green House Sashes.

For sale 30 or 40 Green House Sashes, second hand, without glass—each sash about 8 feet long. Apply at the New England Farmer Office. 4t Sept. 7.

Notice.

The subscriber wishes to procure a small quantity, say half a pint, of acorns from each species of oak growing in New England, with the specific, or where not known, the common name. It is desirable that they should be sent in by the 1st of November, with the contributor's name, as they are to be forwarded to the London Horticultural Society. Any reasonable expense with regard to the above will be cheerfully paid.

4t

J. B. RUSSELL.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention. EBENEZER WIGHT,

46, Milk street, opposite Federal-st., Apothecary. August 3. eopif

Plum and Cherry Stones Wanted.

A liberal price will be paid by the subscriber for one bushel of Plum Stones and two or three pecks of Cherry Stones, to be warranted of the growth of 1831.

Aug. 21. 4t J. B. RUSSELL.

Pear Seed.

The subscriber will pay a liberal price for half a bushel of fresh Pear Seeds.

Aug. 31. 4t J. B. RUSSELL.

Strawberry Plants for Sale.

The following varieties of Strawberry Plants are for sale by David Hagerston at the Charlestown Vineyard: Keen's Seedling, 75 cents per dozen, or \$5.00 per hundred; each, the undressed kind at \$1.00 per hundred, each; Wilnot's Superior, Royal Scarlet, Ros-cherry, Mulberry and Pine Strawberry.

The above will be also for sale at Mr. Russell's Seed Store, Boston, at the same prices—no smaller lot than 50 will be sold of any kind, except Keen's Seedling. Aug. 31.

Bees.

The Subscriber has 500 swarms of Bees for sale, in his Patent Slide Beehives, at 20 cents per pound, weight of each swarm from 40 to 100 lbs. tare of hive deducted; the price of the Patent hives is \$2 a piece, and the price of a single right \$5.

Also for sale, 200 swarms of bees in the old fashioned hive, price 17 cents per pound, tare of hive deducted.

The above will be delivered within fifty miles of Boston, in good order, (warranted free from moths or otherwise damaged) by the first day of March, 1832.

All letters must be sent in before the first day of September, 1831, post paid, to the subscriber, at Brighton, Mass., so as to have time to transport them from Maine. N. B. The weight of the above hives will be taken in September. EBENEZER BEARD.

July 6. ep2m

Nathaniel Dearborn

Respectfully informs his friends and the public, that he has removed his place of business, from State street to No. 110 Washington street, in the front lower chambers over Messrs Hilliard, Gray & Co.'s book-store—where orders are solicited for engraving in all its varieties.

Copperplate Printing neatly accomplished. Plute Tution, by the new system of Instruction. Perspective Drawings made of Machinery, Inventions, &c. 6w Aug. 24.

Seeds for Fall Sowing.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—Garden and Field Seeds, suitable for fall sowing, among which are—

WHITE PORTUGAL ONION.
PRICKLY SPINACH, (for early greens.)
BLACK SPANISH or WINTER RADISH
LONG DUTCH PARSNIP, and a variety of other garden seeds.

ALSO—TIMOTHY or HERDS GRASS—ORCHARD GRASS—RED TOP, RED and WHITE CLOVER, &c. &c. Aug. 3.

Ammunition.

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. 4t Jan.

A Gardener.

A Gardener, with good recommendations, recently from Scotland, wants a situation. Inquire at the N. E. Farmer Office. 4w Aug. 24.

Date's Hybrid Turnip Seed.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A few packages of seed of this new variety of turnip, so highly esteemed in Scotland, and which is described in No. 3, vol. x. N. E. Farmer.—Price 12½ cts. each paper.

Turnip Seed.

For sale at the Seed Store connected with the New England Farmer, No. 52 North Market Street, Boston, 200 lbs. White Flat Turnip Seed, the growth of the present season, raised in this vicinity expressly for this Establishment.

ALSO—Ruta Biga of the very first quality, of both American and European growth; Yellow Aberdeen, Yellow Stone, White Norfolk Field, and Yellow French Turnips; Long Prickly and other Cucumbers, for pickling, warranted genuine and fresh. July 6.

BRIGHTON MARKET—Monday, Sept. 5.

(Reported for the Chronicle and Patriot.)

At Market this day 494 Beef Cattle, 706 Stores, 3817 Sheep, and 580 Swine.

PRICES.—Beef Cattle—More Cattle of the best qualities were at Market to day than last week, but not much variation in prices; we quote prime 4 57½ a 5, good 4 50 a 1 75, thin 3 50 a 4.

Stores.—Nearly all were from Maine, (small Cattle) sales not so brisk as usual.

Cows and Calves.—We noticed sales at 15, 13, 20 and \$25.

Sheep.—Sales rather dull; lots were taken at 1 50, 1 62½, 1 75, 1 88, 2, 2 25, a few prime at 2 50; a lot of wethers at 2 75, a lot at 3, and a small lot of prime at \$4.

Swine.—Trade tolerably brisk; we noticed several lots of from 50 to 100 taken at 4c. for Sows, and 5 for Barrows; at retail 5c. for Sows and 6c. for Barrows.

New York Cattle Market, Sept. 2.—Market pretty well stocked with Beef Cattle—700 head. Sales not so brisk as last week, and some left unsold. Beef Cattle \$5 a 6 50 and some very fat, \$7. Sheep and Lambs scarce; Sheep \$2 a 6; Lambs have advanced to \$1 75 a 3. Fat Hogs worth \$1 25. Store Hogs none in Market. Cows and Calves not in demand: sales from \$15 to 35, and several very fine at \$45.—N. Y. Daily Ad.

At the New York Market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

A GARDEN.

He who has a garden spot, with taste and industry to cultivate it, has a good thing. Man, in his primitive, perfect state of happiness, was placed there,—proof positive, we think, that the garden was made for him, and he for the garden; and notwithstanding his fall and degeneracy, he can still, there, aside from the world and care, snatch some brief Eden moments. Employment in a garden happily connects exercise with pleasure and interest; and as a resort, and a relief from careful perplexity and mental fatigue, the earth holds not its equal.

A friend of ours, the other day, took us into his garden—all the work of his own hands;—he gives as many hours, and successfully, to his business and relative duties, as any man, yet what a little paradise has he there created for himself!—the hand of industry and taste is visible in every part of it. There are the grape vines, the Isabella, the Sweet Water, the Purple Burgundy, stretching their long branching arms, judiciously pruned, crowded with transparent juicy clusters. The pear, the peach, the plum, of golden and purple hues,—the Caucasion gage;—the Belle de Paris;—the Orange Peach, &c. &c, with their rich cheeks reddening and ripening in the sun. The gaudy flower family blooming and blushing in variegated beauty, from the splendid exotic to the wild native pasture flower springing from the mimic crevice;—the miniature rill,—the clean gravel walks,—not an obstructing weed dare lift its head;—and in the midst of all a rural temple, woven with umbrageous foliage: we say, in such a spot, we should almost forget the trifling concerns of nations, and the strife of life, and consider it the most fitting place, surrounded by its beauty and haunts, to worship the giver of all good.—*Salem Observer.*

Professor Hossacker, in a letter to the editor of the Medical Gazette of Inspruck, shows, that, in proportion as the age of the married male exceeds that of the female, the proportion of boys born to girls increases. In cases where the father was from nine to twelve years older than the mother, the male children were to the female, as 123 $\frac{1}{2}$ to 100; when the father was eighteen years or more older than the mother, the male were to the female children as 200 to 100. Is not this a marvellous provision of Providence? The object to be promoted is to supply the deficiency of males, the male parent having lived without propagating the species, and the result being the same as if the male had not lived, or as if there had been fewer males.

RECIPES.

Blackberry Tea a cure for Dysentery or Diarrhoea.—Blackberries are among the most pleasant and speedy cures for this complaint. When the berries cannot be obtained the stems and leaves, or roots should be boiled with a little rice, until the latter becomes entirely dissolved, and the liquid drank with a very little milk.—*N. Y. Farmer.*

Remedy for the Cholera Morbus.—Dr Hope, Surgeon on board H. M. Hospital Ship Canada, states some instances of remarkable success in the Cholera Morbus and says:

'The remedy I gave was—One drachm of nit-

rous acid, (not nitric, that has failed me,) one ounce of peppermint water or camphor, and forty drops of opium. A fourth part every three or four hours in a cupful of thin gruel. The belly should be covered with a succession of hot clothes dry; bottles of hot water to the feet, if they can be obtained; constant and small sipping of finely strained gruel, or sago or tapioca, no spirit, no wine, no fermented liquors till quite restored.'

Diarrhoea and Dysentery.—As the present is the season of the year, for the prevalence of the above diseases, we recommend trials of the following remedy:—

Make a brine of salt and vinegar, (say a teacup full or more) dissolving as much salt as the vinegar will take up,—put one common table spoonful of this brine to about a tea-cup of hot water,—sip down this diluted brine slowly, as hot as you can swallow it, and as many tea-cups full and as frequently, as suits the stomach:—this simple remedy will generally effect a cure, if used in the commencement of the disease. It will always give relief—for children's 'belly aches,' occasioned by eating too much fruit, &c, it is one of the best remedies.—*Pa. Farmer.*

Artificial Port Wine.—The Russians make their port wine thus:—Cider three quarts, French brandy one quart, gum kino one drachm. And the French restaurateurs imitate successfully old hock, by the following mixture: Cider three quarts, French brandy one quart, alcoholized nitre, each one drachm.

Potato Pudding.—Take half a pound of butter, and half a pound of powdered sugar, and stir them together till very light. Have ready a pound of boiled potatoes, which must be quite cold. Grate the potatoes, and beat four eggs till very thick. Stir the beaten eggs and the grated potatoes alternately, into the butter and sugar, with a gill of cream or rich milk. Add a teaspoonful of mixed spice, and a glass of wine, brandy and rose-water, mixed.—Having stirred the whole very hard put it into shells of puff paste and bake it half an hour. This quantity of the mixture is sufficient for two shells the size of soup plates.

Sweet potato pudding may be made in the same manner.

Rhubarb Pie.—For one pie, take four of the small bunches of green rhubarb stalks that are brought to market in the spring, or six if they are very small. Peel the stalks, cut them into little pieces, and stew them till quite soft in a very little water.—When done, mash the rhubarb with the back of a spoon, and make it very sweet with sugar. Set it away to cool. Make a puff paste, when the rhubarb is quite cold put it into the pie, and which may either be a shell or with a lid. Bake it about half an hour.

French Cake.—Take five common-sized tumblers full of sifted flour, three tumblers of powdered white sugar, half a tumbler of butter, one tumbler of rich milk or cream, and a teaspoonful of pearlsh dissolved in as much lukewarm water as will cover it. Mix all well together in a pan. Beat three eggs till very light, and then add them to the mixture.—Throw in a teaspoonful of powdered cinnamon or nutmeg, and beat the whole very hard about ten minutes, butter a deep pan put in the mixture, and bake it in a moderate oven.

Botanical Prospectus.

D. & C. Landreth, Nursery and Seedsman of this city design to issue early in the ensuing autumn, the first number of a periodical work on Ornamental Plants. Of all branches of Natural Science, Botany has ever had the greatest number of admirers; it has been the study of the learned in all ages and in all countries: it charms alike the aged and the youthful, and always presents on either hand, something new and interesting; whether wandering on the mountain top, or traversing the morass, a knowledge of the structure and classification of plants affords the means of abundant interest and employment. Unlike the study of some departments of Natural History, no investigations are to be made but such as are agreeable, and in the language of the late president of the Linnaean Society 'all elegance and delight; its pleasures spring up under our feet, and as we pursue them reward us with health and serene satisfaction.'

The proposed work will be modelled somewhat after the Botanical Magazine of Curtis (English); to Floriculture and the delineation of plants it will be mainly directed—yet it will afford opportunity for occasional remarks on the elementary and physiological parts of Botany. It will be issued monthly in a quarto form, each number embellished with at least four elegantly executed lithographic drawings, colored true to nature, by an artist of high respectability.

The plants to be delineated, (as well native as exotic,) will be selected with reference to their beauty, ease of cultivation, and other desirable qualities, and embrace those of the hot-house, green-house, and open air. Each figure will be accompanied with an accurate botanical description; its natural family and Linnaean class and order; its history; its use, if any, in medicine and the arts, and other remarks likely to prove interesting; together with minute practical instructions for its propagation, soil, culture, and preservation.

Increasing are the requests made the advertisers for instruction as to the culture and general treatment of plants; also, for descriptions of such new ones as their catalogue annually announces. It is believed the work will not only meet the wishes thus expressed by their numerous patrons, but prove useful in nourishing a taste for Horticulture.

They are not stimulated to the undertaking solely by the prospect of pecuniary gain.—Their collection of plants present facilities for contributing, through this medium, to the rational and intellectual enjoyment of their fellow-citizens; it is therefore intended to issue the publication on the lowest terms possible. The price however must depend in a degree on the patronage extended, though under no circumstances will it exceed eight dollars per annum.

It is notice of its publication will be given.
Philadelphia, August 13, 1831. aug 16.

Cocoons Wanted.

The Subscriber will pay cash for Cocoons, from 25 to 50 cents, according to quality.
Dedham, July 15th, 1831. St July 20.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer's office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[If no paper will be sent to a distance without payment being made in advance.

NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, AT NO. 52 NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE.)—T. G. FESSENDEN, EDITOR.

VOL. X.

BOSTON, WEDNESDAY EVENING, SEPTEMBER 14, 1831.

NO. 9.

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

MR FESSENDEN—Since my views upon the subject of *Farmers and Farmers' Daughters'* appear to have been in some degree misapprehended, it may not be unreasonable to ask for the opportunity to say a very few words by way of explanation.

My general object was to show that the debts which embarrass our farmers, could not arise from the fact that their daughters were unwilling to go out to service, since that circumstance, however it may operate, would be inadequate to the effect which it was supposed to produce.

It having been conceded that my opinion on this point might be correct, I did not feel it a duty to trouble you with any remarks in answer to your correspondent 'Oliver' and I could not now overcome my reluctance to say anything further, had I not discovered that you also had understood from my remarks more than I intended to convey.

I would not by any means be understood as objecting to a practice quite prevalent in many parts of the country, where one family has a disproportionate number of males and another of females, which requires an interchange of labor, or where female help is required under any other circumstances, by brethren or neighbors, and the individuals employed to render the required assistance are placed upon the footing of equals. Service rendered in this way, and which those to whom it is rendered will be willing under a change of circumstances to reciprocate in kind, is quite common throughout the country, and it was far from my intention to advance any objection against it when assuming this character.

The situation of kitchen girls in the city is in most cases very different, and although many excellent females are found in this capacity, who both deserve and receive all the kindness and attention which can be rendered to them under such circumstances, this is far from proving that the employment is desirable. Educated as our daughters are, with perhaps a few inconsiderable exceptions, they enter upon this service with extreme reluctance, and feel that it is a degradation. Teach individuals from any class in society that they have a character to lose, that they are esteemed and respected by those about them, and these considerations alone will encourage the best efforts to deserve and to sustain a good name; but treat any one of us with indignity, take away that self-respect, that independent spirit which sustains us when moving amongst our equals and brethren, and the best support of human frailty is gone.

I cannot say what proportion, but assuredly a melancholy one, of tenderly reared females who are reduced to servile employments for subsistence, become humbled and broken spirited,—are too frequently exposed not only to the insupportable insolence of a proud and unfeeling matron, but to the base attempts of inconsiderate young men,—yes, and I blush for human nature, when I add,—of old men too.

Now I am not so Quixotic as to 'make fight' in behalf of distressed damsels, being unhappily destitute of sword, helmet, or Rozinante, nor do I believe

that their troubles are to find an adequate remedy in our generation. And let me assure those who stand in need of 'help' that they have nothing to fear. The iron hand of necessity has lost none of its rigor. Scores and hundreds of trembling victims are struggling to elude its grasp, and struggling in vain. But I ask any father who loves his children, whether he could willingly expose a daughter to such a bazaar of moral and of physical pollution, and whether it should be stigmatized as unbecoming pride in an American citizen, to say that he would sooner follow his daughter to the grave than expose her to an unworthy and cruel degradation, where her strength of mind, or of body might be insufficient to protect her from a fate more deplorable, more soul-harrowing, than a thousand deaths.

I am persuaded that you would not recommend such service to Farmers' Daughters, and it was against this kind only that my observations were intended to be directed. It is a service that I require of no one, and a service that I trust a merciful Heaven may never require from any of mine.

A FARMER.

FOR THE NEW ENGLAND FARMER.

PERMANENT COVERING FOR HOUSES.

MR FESSENDEN—Sir, I noticed lately in the *New England Farmer* an inquiry from your correspondent B. A. of Mendon, for some mode of covering buildings more lasting than shingles; I would offer to his consideration the article of tiles, which can be manufactured wherever there is clay suitable for the purpose; they do not require to be nailed, and are quickly laid on, the cost therefore would not exceed that of shingles, and if well burnt and not porous, they will never decay. It is a matter of surprise that such an excellent covering should never have been introduced yet among us; shingles are a great tax upon the community, from the shortness of their duration and their aptitude to catch fire.

I am informed that at New Orleans rather than use shingles, they import tiles from France. Wishing to have a few tiles to offer occasionally for distribution, I imported about two years ago a small quantity of them from Havre, and if B. A. wishes to try to get some manufactured in his neighborhood, I should be happy to furnish him with a sample of them. At Havre the price of tiles is thirty francs per thousand, delivered on board, which is about five dollars of our money. Their dimensions are about 10½ by 6½ inches, and all that is needful in laying them, is to do it in such a manner as to cover the joints. One thousand tiles, therefore, will cover more square feet than one thousand shingles: the tiles require only narrow slats, nailed on the rafters, for them to rest on; the roof need not be boarded. When we take into consideration the continued expense of shingling, and the premature decay of buildings occasioned by the leaky state of roofs, we shall readily appreciate what great benefit the general use of tiles would be; and among the good wishes which could be offered to our brother farmers, there are few which would contribute more to their advantage and comfort than a tight roof, safe against fire, and safe against decay. Rolled sheet lead

would be of great cost, and it will crack by the heat of the sun, even in the climate of old England; on that account when used there for the covering of buildings, it is always in cast sheets and not rolled.

With much esteem, yours, J. M. G.
Weston, September 5, 1831.

FOR THE NEW ENGLAND FARMER.

MR EDITOR—I have a piece of land on my farm which is naturally rich and loamy, but has been somewhat exhausted for three or four years past by former owners, who have raised several crops without much manure. The crop this year is tolerably good. Now, Mr Editor, I wish to learn of you or some of your correspondents, (who have had more experience than myself) whether the soil will probably produce a good crop of the *White Bean*, without additional manure, as circumstances will not permit the purchase of stock sufficient for that purpose till a period too late. Two or three persons, who have given their opinions on this subject, suppose that the soil is already so rich as to render their growth too luxuriant, so that a crop cannot be produced. I find that it is a very general opinion in this section of the country, (New York State) that no soil will answer for the *White Bean* but that which is very poor. Information on this subject will greatly oblige

AN INQUIRER.
Westchester Co., N. Y. Sept. 1, 1831.

Remarks by the Editor.—The following directions for the culture of the common field bean are from the Farmer's Guide, and we believe are correct. They require dry land that has been tilled with care so as to destroy weeds; and of such fertility as would produce a moderate crop of Indian corn. Poor sandy soils, or gravelly loam, will produce them, provided the beans are wet and rolled in plaster before planting. They can be planted in hills or drills, the rows two and a half or three feet apart, according to the strength of the soil, and ploughed and hoed like other hoed crops. The time of planting is the same as Indian corn.

FOR THE NEW ENGLAND FARMER.

PACKING OF BUTTER.

The defective manner in which butter is often packed in this country is generally observed, and is frequently the occasion of great loss, alike to the manufacturer, the vender, and the shipper. It often happens that this article is brought to market in firkins made of green staves full of sap, and pine heads; the consequence is, that the pickle is sure to leak out, and the butter, impregnated with the taste of the pine, becomes unpalatable, and the shrinking of the staves freely admits the air, and soon renders the butter rancid. In Ireland, where staves to make the packages cost more than double the price they would here, the kegs to put butter in are made of thoroughly seasoned white oak, entirely clear of sap; should the same attention be paid here, the value and consequent profit would be greatly enhanced. The greatest proportion of the butter brought to market, particularly for exportation, it is presumed, is taken in by tra-

Horticulture.

Proceedings of the Massachusetts Horticultural Society, at an adjourned stated meeting held at the Hall of the Institution, on Saturday, the 10th of September, 1831.

The following letters were read by the President.

Montreal, August 25, 1831.

DEAR SIR—Your esteemed favor of the first of May was received, but by some unaccountable delay, not till near the middle of June. For the interest you have evinced, and the attention bestowed, relative to the scions that I sent to the Massachusetts Horticultural Society, you have my best thanks.

When Societies are fortunate enough to have men at their head who are so solicitous for the advancement of their best interests, it is next to impossible but they must prosper, and devoted as I am to Horticulture, nothing can be more gratifying than the attention it at present commands, from innumerable individuals of the first attainments, in almost every quarter of the world, and as far as my feeble exertions can be made, in the slightest manner, serviceable, they may be, at all times and by any one, freely commanded, and to Massachusetts, the place of my nativity, I shall be extremely proud to say 'I have done the State some service.' Your favor ought to have received an earlier notice and I have no very prominent excuse for not having done it, nor do I like excuses, or the necessity for them, but it so happens that I am under the absolute necessity of using the pen but very seldom, and during a busy time, when there is no immediate urgency, I take it with great reluctance, and postpone. Your letter informed me that some scions would accompany it; when written, it was, I presume, intended for private conveyance and I may add that the season was so far advanced when I sent the cuttings, I had not the slightest expectations of any favor in return; therefore, there could be no disappointment; but if, on another occasion, the native Pears could be conveniently procured, I should be very glad indeed to receive them, having the greatest confidence in their ultimate success: as our old stock of foreign varieties, of which there was formerly a great plenty, have nearly all disappeared, and there not being, as I believe, a single seedling of merit in the country. I have a considerable collection of French and Flemish Pears, obtained from Philadelphia, New York and Albany.

Mr Curtis a member of your Society, who is at present here, informs me that he shall leave Boston, for this place next March, and has kindly offered to bring anything that it may be desired to send.

I will also observe, although it is at the risk of appearing somewhat impertinent, that having seen occasionally in the New England Farmer, to which I have been a subscriber for the two last years, an account of various packages of seeds that were received by the Society, it has occasioned no little anxiety to be a participator in them, as I am excessively fond of raising things from seeds, and could the society, consistently, favor me with the smallest portion of such as it shall receive or with any seed of indigenous plants or shrubs, they will be gratefully acknowledged, and every exertion made to reciprocate the favor. I saw on the road side near Boston, and at the Society's rooms, what I suppose to have been Perennial Lupins, blue and white. I should particularly like to procure seed of them and a white Azalia, that was very common, and which I was told produced seed.

I have a communication to make to the Society relative to scions and engraving, which shall be done at some more leisure moment, and in the meantime, I have the honor to be, sir, with the greatest esteem,

Your most obedient servant. HENRI CORSE.
HON. HENRY A. S. DEARBORN,
Pres. of the Mass. Hort. Soc.

HON. HENRY A. S. DEARBORN,
Pres. of the Mass. Hort. Soc.

With this you have a specimen of three kinds of Apples, from the garden of H. Corse, Esq. of Montreal, viz. No. 1. the Nonpareil; No. 2. Reinette Anglaise; No. 3. Corse's Favorite; they are from the trees, from which scions were presented to the Horticultural Society last spring by Mr Corse. But you are informed (lest you may be disappointed with the fruit) that they were all taken from the trees before ripe, and have been three weeks from the trees, and also that they have not this year attained much over half their usual size, owing probably to the great damage all apple-trees received in Montreal last spring from the caterpillars.

The other superior Montreal apple Famuse, was not ripe enough to be eatable when I left Montreal. But probably they will be exhibited to the Society next year, from scions which I procured two years since, and some of them are doing well at Newton and elsewhere.

Yours &c, EDWARD CURTIS.
Boston, Sept. 7, 1831.

Boston, Sept. 5, 1831.

MY DEAR SIR—I send herewith two pumpkins I purchased at the Cape de Verd Islands last March, and I have endeavored to retain more of them for your Society, in which I take great interest; but having a long passage I have been unable to retain any more which I beg you to accept; and remain in great haste.

Very respectfully yours, JOSIAH STURGIS.

The following report being made by the Hon. Joseph Story, on the Consecration of the Cemetery at Mount Auburn; it was
Resolved, That the same be accepted.

The Committee appointed at a meeting of the subscribers to the Mount Auburn Cemetery to consider and report to the Massachusetts Horticultural Society, whether it is expedient to have any, and if any, what religious ceremonies for the purpose of consecrating the said Cemetery, have had that subject under consideration, and beg leave respectfully to report to the said Society:

1. That in the opinion of the committee it is expedient to have the said cemetery consecrated by religious ceremonies on Saturday the twenty-fourth day of September instant, in the afternoon, at Mount Auburn. And if that day should not be fair, then on the next fair day, excluding Sunday.

2. That the religious ceremonies proper for the occasion would be

An Introductory Prayer,
An Address, and
A closing Prayer,

with an original Hymn to be sung by the Assembly, and other appropriate music.

3. That the choice of the persons to officiate at the religious ceremonies of consecration and all other arrangements suitable for the occasion

ders in the country. It would probably be to their advantage to adopt the following method, that is said to have been successfully tried, of having a cask with cool and strong pickle in the store cellar, directly under the counter, where the butter is weighed, and a hopper in the counter over the cask, and empty the butter directly from the scales into the hopper, from which it is conveyed to the pickle, and every night or the next morning carefully sort the butter as nearly as can be with regard to color and quality, so that what may be contained in a keg should have the same appearance, and the buttermilk well worked out, and the butter carefully packed in good seasoned white oak kegs, clear of sap. It is believed that this method would not only render the butter of more value, but would be convenient to those who take it in. It is generally brought to the trader in boxes, and from a considerable number of different persons in a day, and of course of various colors and qualities, which would remain in the pickle separately in the same form it was in when it was emptied from the boxes, and leaves it in the best situation to sort and pack, and puts it at once out of the way, instead of its being left about the store exposed to the air as has sometimes been the case.

Portsmouth, N. H. Sept. 9.

FOR THE NEW ENGLAND FARMER.

DEARBORN'S SEEDLING PEAR.

This is the name given by the Committee on Fruits to the pear, whose history with a figure annexed is so accurately delineated by the President of the Massachusetts Horticultural Society in the last number of the New England Farmer.

This fruit was thus characterized by the committee:—A pear rather under the medium size; skin smooth and fair, and of a light yellow color, very melting and of the finest flavor. Indeed in this respect it appeared fully equal to the very ancient and once famous and delicious St. Michael. And as there are appearances which indicate that it may prove a good bearer, it bids fair to become a valuable acquisition to our list of summer fruits. And although the committee had in the first instance proposed that this fruit be called the DEARBORN PEAR, yet they were not at the moment aware that in thus naming a fruit they had been anticipated on the other side of the Atlantic.

The 'DEARBORN PEAR' properly so called, is quite another fruit. It is a new and most superior variety raised by Dr Van Mons of Louvain in Belgium and was so named by him in honor of the President:—It is not yet in America.

ONE OF THE COMMITTEE ON FRUITS.
Sept. 12, 1831.

FOR THE NEW ENGLAND FARMER.

SERIOUS QUESTIONS.

Which of the two following habits is the most efficacious in shortening human life—*Hard working* or *Indolence*? While the former is supposed to have destroyed thousands, is it not an alarming fact that the latter, even without the aid of luxury and intemperance, is secretly but insidiously undermining the health, and unmercifully slaying its tens of thousands!

Again—Which of the above habits is the most potent in abridging, not the frivolous, but the consoling and substantial pleasures of life? I wait for an answer. J. K.

should be made by a committee of Arrangement to be chosen by the Horticultural Society, with full powers for that purpose.

4. That the committee of arrangements should have full power to fill all vacancies occurring in their own body, and to appoint all suitable officers to assist them in the discharge of their duties; and that they should give due public notice of the order of their arrangements when they shall have been completed.

All which is respectfully submitted.

JOSEPH STORY.

By order of the Committee.

Resolved, That a Consecrating Committee of nine members be chosen.

The following gentlemen were elected: Hon. Joseph Story, Henry A. S. Dearborn, Charles P. Curtis, Rev. Charles Lowell, Zebedee Cook, Jr., J. T. Buckingham, Geo. W. Brimmer, George W. Pratt, Z. B. Adams.

Resolved, That no fruit be eaten in the Hall of the Society except by the Committee on Fruits, and that all fruit sent for exhibition, and premium, be disposed of by the persons who send them for exhibition.

George W. Beale, Quincy, D. L. Pickman, Salem, J. C. Lee, Salem, Joshua Clapp, Boston, Edward Colman, Boston, were admitted members. Adjourned to Saturday next, 11 o'clock.

FLOWERS EXHIBITED.

From Mr Carter of the Botanic Garden, Cambridge, *Amaryllis belladonna*, *Delphinium grandiflorum*, *Lobelia celestina*, a native.

A large plant of the *Mimosa sensitiva*, from E.

Fine Asters, and other flowers, from H. A. Breed, of Lynn.

VEGETABLES.

Sweet Potatoes of fine size and appearance were exhibited by Mr N. Davenport, of Milton, who has been very successful in their culture for several years.

Cape de Verd Squashes were presented by Capt. Sturgis, and their seeds distributed.

A. D. WILLIAMS.

FRUITS EXHIBITED.

Apples.—By Henry Corse, Esq. of Montreal, specimens of the Nonsuch, Reimette Anglaise, and Corse's Favorite; these it will be recollected are some of the varieties, the scions of which, were kindly presented to the Society, in April last by that gentleman, and particularly described by him: the Nonsuch was overripe, although this as well as the Reimette Anglaise, bore evident marks of fine fruit; Corse's Favorite possesses a high and very pleasant flavor.

By Stephen Williams, Esq. of Northboro', four kinds of large fair looking apples, grown on trees imported from Hamburg in 1800, part of which were not at maturity, one kind which was in eating, the red variety, was thought to be a fine fruit.

By Dr Robbins, of Roxbury, a basket of his handsome red apples.

Pears.—By Mr R. Manning, from the garden of Mr J. Gardner, Salem, large size Pears, very melting and of good flavor, the scions of which are said to have been received from Hingham about 30 years since, name unknown. Also, the 'Cabot Pear,' raised by Joseph S. Cabot, Esq. of Salem, from the seed of the Brown Beurre, which it somewhat resembles, but of less size; the specimen remained on the tree till overripe. Also, a variety supposed to be the 'Bezy La Motte,' (Pom. Mag. No. 143) grown on a tree imported from England by D. L. Pickman,

Esq. Salem, quality rather indifferent. Mr Manning also presented, Lowry's Bergamot, sometimes called Prince's Sugar Pear; this last is embraced in the collection of trees presented by the Messrs Prince to the Society; the specimen was over-ripe. Also, the September Orange, a poor fruit, and the Grise Bonne (Coxe No. 17.) This is sometimes erroneously called Green Catherine; it is a pleasant pear, and possesses a peculiar musk flavor. A further specimen of Mr Hooper's fine pear was received from his garden in Marblehead.

By Messrs Winspiss, the large Chelmsford Pears, sometimes called Marquis.

By Mr Ebenezer Hathorne, Salem, a pear, said to be a seedling, of small size and rather ordinary.

By Mr Wm. Pomeroy, Brighton, the Verte longue or mouille bouche, and a delicate looking fruit, said to be called the Lady's Pear.

By Mr Stephen Williams, two varieties, grown on imported trees, one a large greenish pear, the other a long and rather peculiar shaped russet; neither was recognised by the Committee.

By Perrin May, Esq., Brown Beurre.

By R. F. Phipps, Charlestown, a cluster containing five large size Bartlett Pears, from a graft of 1830—Rondelette de Rheims, and a fine specimen of Andrews Pears.

By John Perrin, Esq., Dr Hunt's Connecticut Pear, the Grise Bonne, and a handsome specimen of the Fulton Pear; this last is very productive, and said to be gaining favor, but the committee have not as yet seen the fruit entirely ripe.

Peaches.—By Hon. H. A. S. Dearborn, a beautiful specimen of the Heath freestone.

By S. G. Perkins, Esq., a handsome cling-stone, called the Pine Apple Peach, raised from the stone; not at maturity.

By Perrin May, Esq., large and fine cling-stone Peaches.

By Mr E. M. Richards, two varieties of natural Peaches, both good, the cling-stone of remarkably fine flavor.

By Mr Aaron Baldwin, yellow rareripe, large and fine.

By Mr Geo. W. Bond, from the garden of Mrs Sigourney, a very fine large size, round yellow seedling Peach, grown on a tree of the second generation of the same kind—an excellent fruit. The Committee recommend that it be called the 'Sigourney Peach.'

Grapes.—By Geo. W. Pratt, Esq., beautiful clusters of White Chasselas and Black Hamburg.

By Mr Samuel Pond, a basket of fine white and red Chasselas.

By Mr Charles Senior, four clusters of handsome white Chasselas.

By Benj. Guild, Esq., specimens of Isabella, and black Hamburg.

By Perrin May, Esq., handsome clusters of white and red Chasselas and black Hamburg.

By Dr S. A. Shurtleff, Mr Sellers' black Grape.—This fruit so closely resembles in appearance and flavor the black Hamburg, that the difference was hardly to be discovered.

By Mr Amos Perry, of Sherburne, Fox Grapes, of large size, and sweet.

All the grapes exhibited today were of open culture, and notwithstanding the foliage has suffered so severely the present season, the fruit appears finer and more perfectly ripened than for some time past.

In behalf of the Committee on Fruits.

E. VOSE.

Horticultural Hall,
Saturday, Sept. 10, 1831.

EFFECTS OF BUDDING.

THOMAS G. FESSENDEN, ESQ.

Noticing some comments upon the effects of the graft or inoculation upon the stock, I have merely time to state the following—A bud of a peach tree having the disease usually termed the *Yellows*, inserted in a healthy stock imparts to it the disease.

—A bud of the Old Newington whose natural fruit is round, sweet, and luscious, inserted in the Bitter Almond at five feet from the ground, produced oval fruit of a bitterish flavor. The buds of the Weeping Cherry inserted in the stock of a Mazzard Cherry, which latter has usually only a few strong roots, causes it to have far more roots, many of which are small and fibrous, differing from those usually appertaining to a Mazzard Cherry.—These facts my own eyes have witnessed, and my father has many more in store, which he imparted about 2 years since to Jas. Mease, Esq. of Philadelphia at the especial request of that gentleman. A society in Europe offered two or three years since a premium for the best disquisition on this subject, and my father proposed being a candidate for the premium, but omitted attending to it. I have no question that he is in possession of more facts on the subject, than any person now living, for he has been for above half a century a close observer. He is not with me now or I might say more.

ARRACACHA ROOTS.

I notice some remarks also relative to the Arracacha. We have continued to cultivate it since the first period of its introduction to this country, which I think was just about 8 years ago, and have never lost it, as most others have, but have transmitted many hundreds of the increase to France, England, and to different parts of our own country. We pursue the same course adopted by the Horticultural Society of the Island of Jamaica and published in their Transactions, from which it was copied into the American Farmer 4 or 5 years since at my suggestion.

You can readily find it there by reference, but if not I can lend you a copy of the Transactions. We have two varieties of it, that are very distinct in appearance and in quality. I recollect sending a number of roots about four years since to J. D. Legare, Esq. Editor of the Southern Agriculturist, but have not understood how he succeeded with it.

Yours, very respectfully,

WM. ROBERT PRINCE.

Lin. Bot. Garden, N. Y.
Sept. 9, 1831.

Mohawk Rail Road.—On Monday afternoon the American locomotive De Witt Clinton, in returning from Schenectady, with a train of cars overtook the coaches drawn by the horses, which had started some time previously, returned several miles, overtook them again, and finally ran 7 miles and a half in 13 minutes.

Yesterday morning the engine came down with a train of 4 cars and 63 passengers in 35 minutes, this being the quickest trip yet made. The speed and power of this engine are now fully tested, and the only thing remaining is to ascertain the most convenient fuel.

The English engine was taken up to the work shop at Schenectady yesterday.—*Albany Daily Advertiser*.

Winter Melon.—At a meeting of the Horticultural Society of Charleston, S. C. on the 10th ult. Mr J. D. Legare exhibited the winter melon of the South of Europe, one of the properties of which was its keeping perfectly sound during the whole winter. These melons it is said are raised in large quantities on the shores of the Mediterranean and in the Orange Gardens of Toulon, whence the markets of Paris are supplied.

From the Lowell Journal.

SILK MANUFACTURE.

NO. III.

America is destined to be a rich, silk growing and silk manufacturing country. But her advance towards that desirable state of things must be gradual and systematic. Every attempt to do that at once, which can only be effected in a course of years, must ultimately fail; while patriotism and enterprise will be discouraged by the enormous expense and fruitless labor that will be incurred. When we take a view of the numerous branches of science and art of which the silk business consists, from the planting the mulberry tree to the production of those elegant and delicate stuffs, which daily issue from European looms, it is natural to ask ourselves by which of those branches is a nation to begin?

The two great divisions of human labor, agriculture and manufactures, require to be carried on separately, and by different hands. A nursery of mulberry trees and silk worms can never be profitably attached to a manufacturing establishment. To say nothing of the immense expense which this complex business would occasion, it must be evident that the profits of the manufacturer should not be dependent on the success of the agriculturist. The risk would be too great; one hard winter, one bad crop of cocoons would reduce to nothing the earnings of the artist; and he could not with safety carry on his business in such a perilous situation. The raising of silk worms, therefore, must be left entirely to the farmer, and the mechanic must apply himself to those branches, which are within the proper line of his business.

Manufactures are of slow growth, and in their beginning, particularly, require great means and powerful support. Recent experience in the case of cotton and woolen manufactures has sufficiently proved the truth of this position. I am therefore of opinion, that the produce of the American silk should be employed as an article of *foreign commerce*, before it is manufactured into stuffs in this country. Great profits are to be derived from this branch of business, and when it shall have arisen to a certain degree of strength and prosperity, manufactures will follow in its train.

It was by this slow and gradual course of proceeding that the cotton business has risen in the United States to the degree of prosperity it has attained.

For more than twenty years, cotton was prepared and sold as a raw material, without any attempt to convert it into manufactured stuffs. During that period the exportation of raw cotton produced immense profit to this country. The business at last was overdone, the profit diminished, and domestic manufactures were established.

Thus instructed by experience, as well as convinced by the reason of the thing, I would recommend the same course to be pursued with regard to silk.—Nothing should be attempted at first beyond preparing it in the form of a raw material.

Mr D'Honnegue says, 'I have observed with astonishment that although there is not the least encouragement for the farmer and planter to attend to this production, nevertheless the mulberry tree is cultivated, and silk worms are raised in all parts of this country, from the north to the south, and from the east to the west. I have examined the cocoons and extracted silk from them, which I have found superior in quantity and quality to any that I have ever seen; therefore I think this part

of the business may be left to itself. The main object is to find employment for the silk produced by the American citizens, and to establish in some central place a regular market for their cocoons. Their industry stimulated by their interest will do the rest. Planting the mulberry trees, and raising silk worms, are not mechanical arts, like the other branches of the silk business. Experience and observation will soon make the American farmer perfect in that business. When they find that bad and imperfect cocoons do not sell for so high a price as the good ones, they will inquire into the disparity, remedy the evil, and none but good cocoons will be found.

V.

ORCHARD GRASS, &c.

The season for seeding orchard grass, tall meadow oat grass, &c, is fast approaching, and we have thought that the following hints might be acceptable to those intending to cultivate these grasses. Many persons have failed in producing orchard grass after much trouble in obtaining seed and preparing their ground, and generally the fault is attributed to the seed. This may sometimes be the case; but we apprehend the cause of failure may as often be attributed to the manner of putting the seed in the ground as to the seed. It is a very light, chaffy seed, or rather an extremely minute seed, closely surrounded by a large chaffy husk; and therefore, if buried too deep, liable to rot in the ground; or, if too shallow, to remain dry on the surface. In a conversation with Mr Robert Sinclair on this subject, he suggested that it would be well, in sowing orchard grass, to adopt the English practice in preparing the seed, which is to spread out the seed four or five inches deep on a floor, and sprinkle it with water, stirring it occasionally for 24 hours, so as to dampen it thoroughly before sowing it. This makes the seed heavier, and it consequently falls into the crevices of the earth better, and is not so liable to be blown about by wind before it is covered by the harrow. It also vegetates sooner and better. We also think that the common harrow is too coarse an implement for any grass seed; it is apt to bury much of it entirely too deep, and at the same time to leave some on the surface not covered at all. We have seen at the north a sowing thickly set with small branches and twigs used instead of a harrow; but think that a harrow with double the usual number of teeth, but these of only half the common size, would be much the best implement. This would require the ground to be well prepared of course, but that ought to be done under all circumstances. The tall meadow oat grass is gaining rapidly in public favor, and will doubtless be generally adopted. It is peculiar for its very early and very late and abundant supply of pasture, and is considered the best grass to sow with lucerne, 12 to 16 pounds of the latter to a bushel of the former being the usual quantity to an acre.—*American Farmer*.

HORTICULTURAL.

There are to be seen in the public garden kept by Mr Smith, in this village, several plum trees of different kinds, heavily laden with fruit, upon which there does not appear any marks of the curculio, although the plums in the neighboring gardens have all been destroyed by them. This garden has been kept open during the warm season, for several years past, as a place of public resort, for eating ice cream, &c, and has been

lighted up with open mouthed glass lamps during the fore part of each evening. The ground, as usual in such places, is laid out into walks and plats. The plats are planted with ornamental shrubbery and flowering plants, amongst which stand the plum trees referred to, and visitors are not allowed to tread upon the plat.

Query. Why these plums escaped the ravages of those insects?

Was it because the lamps were many of them placed in the plum trees, by which the trees became partially covered with oil? or because the smoke of the lamps ascended into the tops and affected the foliage, communicating to it some disagreeable property, which drove the insects from the trees? or was it on account of the disposition of insects to fly towards the light, during the night, by which they have approached so near the blaze of the lamps as to be destroyed by them? The latter supposition appears to us the most reasonable. Knowing that most insects during the routine of transformations assume the forms of moths or millers, many of which are very troublesome about candles during warm evenings; it may be well to inquire whether the curculios do not, at some particular season, appear in that shape attended with the disposition to approach fire light? If so, may not these destructive little creatures be destroyed by placing a few lamps in a plum orchard, during that particular season when they appear.

I am aware that the idea of lighting up our fruit orchards with lamps, may disturb the gravity of some of our sober readers, but should it be found useful, and thereby become common, it would be thought no more of, than it now is to see the portly figure of a judge posted up in our corn fields with presented arms.

We think this accidental discovery of a few plum trees, with their fruit entire in the midst of a district where the crop of plums has been entirely destroyed the present season by the curculio, promise much towards discovering an antidote; and any observations on the subject will be thankfully received, and laid before the public.

Genesee Farmer.

From the American Farmer.

OKRA.

This is one of the most excellent of our garden vegetables, and yet it is almost entirely neglected in Baltimore. In Louisiana, and, indeed, in all southern states, a dinner is scarcely considered complete without it, in some shape or other. Among the poor of the south it is considered one of their greatest blessings. It is considered not only delicious but very nutritive and wholesome. It is mostly used in soups, and, combined with tomatoes and the usual condiments, in a dish called *Gombo*, a recipe for making which will be found in the American Farmer, volume 12, page 39, from the pen of our excellent housewife correspondent 'Cousin Tabitha.' We hope our citizens will give Okra a trial—for it is equally with tomatoes and egg plants worthy of their favor. We saw it selling in our market, (or rather offered, for we saw no one buying it,) at two cents a dozen a few days since—were it not of such easy cultivation and so very productive, the time would soon come when it would readily command six times the price.

Since the above was prepared, the Southern Agriculturist for August, has come to hand, with

the following recipe for making okra soup, by Mr Legare, the accomplished editor of that work.

OKRA SOUP.

We have seldom met with this most excellent soup out of the vicinity of Charleston, and we believe a knowledge of the proper mode of cooking, will render it a favorite wherever it can be cultivated. We strongly recommend it, as being most excellent and nutritious:

The pods are of proper size when two or three inches long, but may be used as long as they remain tender, which is judged of by their brittleness—if good (that is fit for use) they will snap asunder at the ends, but if they merely bend, they are too old, have become woody and must be rejected, for a few of such pods will spoil a dish of soup. I will now proceed to give you directions for making the soup. I have taken definite quantities, so that the proper portions of each may be clearly understood by you, smaller quantities may be used, but the proportions ought to be observed, as well as the length of time for boiling.

Take one peck of okra pods, which must be very tender, and of which you will judge by the rind already given, cut them across into very thin slices, not exceeding 1-8 of an inch in thickness, but as much thinner as possible, as the operation is accelerated by their thinness. To this quantity of okra add about one-third of a peck of tomatoes which are first peeled and cut into pieces. This quantity can be either increased or diminished, as may suit the taste of those for whom it is intended. A coarse piece of beef (the shin is generally made use of) is placed into a digester with about two and a half gallons of water, and a very small quantity of salt. It is permitted to boil for a few moments, when the scum is taken off and the okra and tomatoes thrown in. These are all the ingredients absolutely necessary and the soup made is remarkably fine; we, however, usually add some corn, cut off from the tender roasting ears, (the grains from three ears will be enough for the above quantity)—we sometimes add about a half pint of Lima or Suba beans—both of these improve the soup, but not so much as to make them indispensable, so far from it that few add them. The most material thing to be attended to is the boiling, and the excellency of the soup depends almost entirely on this being faithfully done, for if it be not enough, however well the ingredients may have been selected, the soup will be very inferior and give little idea of the delightful flavor it possesses, when properly done. I have already directed that the ingredients be placed in a digester. This is decidedly the best vessel for boiling this or any other soup in, but should there be no digester, then an earthenware pot should be preferred, but on no account make use of an iron one, as it would turn the whole soup perfectly black. The proper color being green, colored with the rich yellow of the tomatoes. The time which is usually occupied in boiling okra soup, is five hours—we put it out at 9 A. M. and take it off about 2 P. M. during the whole of which time it is kept briskly boiling, the cook at the same time stirring it frequently and mashing the different ingredients. By the time it is taken off it will be reduced to about one half; but as on the operation of the boiling being well and faithfully executed depends its goodness (as I have already remarked) I will state the criterion by which this is judged of. The meat separates entirely from the bone, being 'done to rags,' the whole appears as one homogeneous mass, in which

none of the ingredients are seen distinct—the object of this long boiling being thus to incorporate them—its consistency should be about that of thick porridge.

Large Peach Orchard.—A Mr Jones at Shrewsbury, N. J. about 35 miles from New York, has we presume the largest peach orchard in America. One is a mile and a half long, and contains 110 acres; the other contains 40 acres: in both there are about 22,000 trees. They were commenced about 9 years since, and the profits are fast raising the enterprising owner from poverty to wealth. It is said, he last year refused \$7000 for the peaches on the trees. The crop the present year is not so abundant; but the price in market is sufficiently increased, to afford him a handsome income. About two weeks since, Mr Jones, with some of his neighbors, sent a cargo of 400 baskets to the New-York market, which readily sold at \$2 a basket. A basket contains a little short of a bushel. Some of his better peaches have since sold quick at \$5 a basket. The soil of these orchards is worth very little for any other purpose, and is poorer than the pine plains in this vicinity. The trees, however, are well manured, and the ground kept clean from weeds and grass. The trees appeared in the best condition, and it was difficult to find a diseased one among them.

We gathered the foregoing facts from a gentleman of this town, who has lately visited these orchards.—*Springfield Republican.*

From the Western Ploughboy.

MR EDITOR—In your last Ploughboy, I observed an interrogatory: 'has no gentleman in St Louis, the Buffalo Berry?'—There is one in my garden, about four years old, which has not yet produced a single berry. Dr Farrar has several of these shrubs older, and perhaps may bear this year. If you know of any persons who wish to cultivate the grape, such as the 'Cape,' 'Red Madeira,' Arkansas, and a grape of good character, from El Passo, a village, between Santa Fe and Durango, they may have them from me, gratis, next November. I should have timely notice, through you. I have been obliged to distribute most of my collection. The balance on hand I wish to give those who will make good use of them, and divide with their neighbors. I wish our agriculturists should attend more to many articles you have named in your valuable paper. The gooseberry and currant make valuable and cheap wines. The English make more champagne wine from their gooseberries, than the French from their grapes, and a most elegant imitation. I would engage 100 slips of the large English gooseberry next November, on the same terms as the grape slips, to any person who will engage earnestly in the business. They are the genuine kind for making champagne wine, green and delicious when ripe, and as large as hickory nuts. Some of the bushes have now upwards of half a bushel on each. They do not grow as large as the wild, or native bush, nor are they as hardy as in England. A.

St Louis, July 1, 1831.

From the Genesee Farmer.

BARLEY.

Never, perhaps was there a more pitiful display of ignorance, than in the harvesting of this article last season. Thousands of bushels were ruined for

the lack of a little knowledge, easily and cheaply obtained. No wonder our farmers are discouraged in their attempts to raise barley. Generally they do not grow more than half a crop, and nine chances in ten but they will suffer this to take serious injury in harvesting. I do not mention this as a reproach, but as a misfortune. To many of our farmers, barley is a new article, and its culture not at all understood. I have given to the readers of the Genesee Farmer, a few practical directions upon the preparation of seed barley, time of sowing, &c. I stand pledged to give them good and sufficient reasons for the treatment recommended. But my object in this treatise is not to redeem that pledge, but as it is the season for harvesting barley, to make a few brief remarks upon that head.

It is true, that last year was an uncommonly critical season for producing barley, and with a few exceptions the whole crop of the country was more or less injured. To this the lengthened visages of our brewers will sufficiently testify. The damage consisted chiefly in blighted barley or what is commonly called 'black ends' these are produced either by the grain being badly lodged, so much so, as not to allow the wet to escape from it, or from suffering it to remain too long upon the ground, when the least dampness will not only discolor the whole, but will blight at least a part of it. The latter is a very common way in which barley receives injury; and it does seem truly a pity, that when the bountiful hand of Providence has spread over our fields a luxurious abundance, we should suffer that bounty to be lost. Now the great secret of harvesting this crop properly, is to cut it, not when too green, but before it is fully ripe, and your barley will come out a bright yellow color when it is threshed. It should be well dried before it goes into the barn, else the fermentation will be so great in the mow as to injure the life of the grain. If there be any patches in your field which are lodged, the grain which comes from them will do well for your pigs; but as you hope to obtain the first price in market, do not mix it with your standing barley; cut and keep it separately. There is no doubt that barley allowed to stand in the field until it gets fully ripe (if it can be harvested,) without receiving any dampness, malts more freely than when cut earlier; but in our climate, this is extremely difficult, and if it does get wet the damage is so fatal, that as a general rule, it is best to harvest it before it be fully ripe, when a little wet weather will not affect it, and the only precaution necessary to be taken, is to have it perfectly dried before it goes into the barn.

Albany and Schenectady Railroad.—A gentleman from the West, who passed on the new rail road to Albany, informs us that the passage is made in a few minutes more than an hour, and that competition has already reduced the price from fifty to twenty-five cents for each passenger. Many visitors to Saratoga Springs now go and return that way; and all speak in unqualified terms of the ease, the celerity and the pleasure of this mode of conveyance. The inclined plane, at the western termination, is nearly completed; and will be prepared for use in about two weeks.—The embankment of this place is about one hundred feet high. It commands a beautiful view of the valley of the Mohawk and the city of Schenectady.

Traveller.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, SEPT. 14, 1831.

SUCCESSFUL CULTIVATION OF LUCERNE.

On the 1st inst. we had the pleasure of viewing a very fine plot of Lucerne, in vigorous growth, on land in Dorchester, owned by Mr John Swett. The present crop, which is nearly fit to cut, is the fourth crop the same ground has produced this season. These crops Capt. S. assures us will average $1\frac{1}{2}$ tons each to the acre, making the whole produce of the present season equal to six tons per acre. The quality of this kind of grass is as extraordinary as its quantity per acre; cattle preferring it to any other food, and thriving upon it in a remarkable manner, especially, when cut and fed out green by way of *soiling*.

Mr Swett attributes his success in raising this grass to the following causes. He was very careful to clear the land of weeds, and the seeds of unprofitable plants by a series of hoed crops; and sowed the seed thicker than has been usual with cultivators, who have been less successful in raising this valuable product. The soil is a light and sandy and gravelly loam, which one would believe not capable of producing anything which would render its tillage profitable.

It would be well for every cultivator in the vicinity of Mr Swett in Dorchester to examine the piece of lucerne near the front of his Mansion-house, and be convinced by personal observation, that our soil and climate are not unfavorable to the production of this celebrated product of modern husbandry.

POISONED CHEESE.

A late number of *The Republican*, a newspaper, printed at Springfield, in this state, after giving the substance of some remarks on poisoned cheese, lately published in the *New England Farmer*, states that 'within the last two months several families in this town, have immediately after eating milk been seized with severe sickness, with all the symptoms of being poisoned. Two men, one of whom is a physician, drank of the milk to test its effect, and found it alike sickening and distressing. Though the milk was purchased of persons in the habit of supplying our citizens with the article, no suspicion rested that the milk was poisoned by their means. We have conversed with a learned and skilful physician, who has witnessed most of these cases; and it is his opinion that the poison was caused by the cows eating the *Poke weed*, instead of the *Lobelia*. He examined the pasture where the cows fed which furnished the poisoned milk, and found plenty of the *Poke weed*, but very little of the *Lobelia*; and at the same time an appearance that the cows had eaten the *Poke weed*, and none that they had eaten the *Lobelia*.—The same cows when put into another pasture, free from these plants, furnished healthy milk. It was the opinion of this physician, as well as another we conversed with, that cows would rarely if ever eat the *Lobelia*. It grows in abundance in this vicinity, and if they had eaten it, its injurious effects must have been long since and more generally felt. Although, as it is believed, the instinct of animals will generally teach them to avoid eating poisonous vegetables, a cow may eat what would poison her milk, when it would not injure her.

With these facts before us, we think it is the solemn duty, while it is for the interest, of those who supply milk to the public, as well as all who pasture cows, to take measures effectually to destroy the growth of plants which put in jeopardy the health and even lives of our citizens.

ALARMING DISEASE IN HORSES.

To the Editor of the New England Farmer.

DEAR SIR,—I have this moment received your favor relative to the alarming and unexampled mortality of the horses in this vicinity and in some other parts of the Commonwealth. You ask my opinion as to the disease, the probable cause and the remedy. I will premise that I am no farrier, having never till recently had occasion to apply any remedies for the diseases of my own horses.

A fortnight since I lost a valuable horse, young and apparently in fine health, of the prevailing disorder. On returning from Church at noon, I noticed a continual inclination of the head, to the right, and found considerable difficulty in keeping him in the middle of the travelled path. I observed also that his movements were more heavy and dull than usual. On reaching home, my hired man imagined he had bots (this being the first instance in my knowledge of the prevailing disease that had occurred in this vicinity) and gave him the usual dose in such cases of gin and molasses. The horse was then turned into the pasture, where he had run for two months previous, his head and motions still inclining to the right. After giving a few rods he stopped and commenced turning round on his heels, (moderately) and continued this movement a few hours, when he fell, and the next day, about twenty-four hours after he was taken, died. Soon after he fell, on the day previous to his death, I had him bled, but to no purpose—the disorder had progressed too far.

On describing this case to Dr Bartlett of Concord, he observed that he had lost a horse some months previous in the same way; the symptoms, disease and termination, being in every particular as he described them, perfectly similar to those which I had observed in my horse. Dr Bartlett dissected the head of his horse, and found the disorder to be a dropy of the brain, there being collections of water in both ventricles of the brain.

A Mr Locke of this town lost (yesterday) a very good horse, of apparently the same disease. After his decease Dr Proctor of this place examined his head and found an effusion of blood upon one of the lobes of the brain. The head was very carefully dissected and examined by Dr Proctor and he has no doubt that the horse died of an apoplexy. In both these cases, which have been examined, there is no question that the disease was upon the brain. The instance related by Dr Bartlett having been a *serous* and that of Dr Proctor a *sanguineous* apoplexy. The symptoms in all the cases which have occurred in this town were similar to those which occurred in the above three cases.

As to the cause of this disease I know nothing. In most instances the horses that have been attacked fed upon grass.

Whether it is to be attributed to the food or the state of the atmosphere, which may have caused an unusual plethora of the vessels of the head, I must leave to those to decide who know more of the nature and diseases of horses than I do.

The remedy if any, is no doubt to be found in copious bleeding in the first stages of the disorder.

Not less than from 6 to 8 quarts should be taken from the horse, and this when done on first perceiving the symptoms, and be ore an effusion of blood upon the brain, has, I am told, in some instances effected a cure.

Yours respectfully
Lexington, Sept. 13, 1831. E. PHINNEY.

Broom Corn.—The mania for cultivating Broom Corn in this and the neighboring towns, never raged so universally, as at the present season; the limited cultivation and great consumption, by exportation, of the article last year, very much enhanced the price, and this season but little else appears worthy the attention of our river agriculturists. A ride a few days since through Hadley and Hatfield meadows to Sunderland, confirmed the opinion we had heard expressed, that Corn Brooms must fall from the immense quantities growing along the Valley; wherever we rode, nothing but vast fields of this beautiful crop presented themselves, extending in some places for miles on every side, with its lofty stalk and rich tassel, affording ample testimony to the vegetable richness and strength of the soil on the banks of the Connecticut; we saw some little pieces on the uplands which were diminutive in size and grew with a sickly aspect, while the meadow crops rose to twelve and fourteen feet in height and stood close as the thickest forest.—*Northampton Courier*.

Protection of Lambs and Geese.—It is but little known, but is nevertheless a fact, says the Portland Mirror, that a little tar rubbed on the necks of your lambs or geese, will prevent the depredations of foxes among them, these animals having an unconquerable aversion to the smell of tar.

Bee Moth.—A friend informs us, he has discovered by experiment that dry comb laid about hives, forms a trap for the moth, by attracting the miller, which deposits its eggs in the comb, where they are easily destroyed. A piece of comb which he placed for the purpose, was completely filled with the moths.—*Western Teller*.

Can you beat this?—Mr Lemuel Blake, of Alstead, raised, the present season, from one bean, 190 pods, and 1009 beans! This from a person who assisted in counting.—*Vermont Intelligencer*.

The American census for 1830 has been completed, and the result published. The population of the United States which was 9,637,000 in 1820, was last year 12,976,000, or, in round numbers, thirteen millions. What a prodigy is the growth of this republic! When the Revolution commenced, 1776, it had less than three millions of inhabitants, and now it has thirteen! Then it was on a level with Switzerland or Denmark in political consideration; now it is the second naval power in the world! We rejoice in its progress; for its strength and glory belong to the people, and to the cause of truth, justice, and freedom, all over the world. It is pleasant to observe, that the states in which there are no slaves are advancing so much more rapidly than the others. The fact renders the evils of slavery more palpable, and holds out the prospect of its diminishing every year in relative importance. The population of Scotland and England, in 1811, was 12,358,000, 600,000 less than the United States last year; and New York alone has very nearly as many inhabitants as Scotland had in 1821.—*London Times*.

MISCELLANY.

THE LAST MOMENTS OF WASHINGTON.

GEORGE WASHINGTON BASSETT, Esq. of Fredricksburgh, furnished Mr SILAS E. BARROWS of this city with the following interesting account of the last moments of 'the father of his country.' Mr Barrows has politely handed it to us for publication.—*N. Y. Inquirer.*

The following circumstantial account of the last illness and death of Gen. GEORGE WASHINGTON was noted by Tobias Lear, on Sunday following his death, which happened on Saturday evening December 14th, 1799, between the hours of ten and eleven; he was born on the 22d February, 1732.

On Thursday, Dec. 12th, the General rode out to his farms at about 10 o'clock, and did not return home till past 3. Soon after he went out, the weather became very bad; rain, hail and snow falling alternately, with a cold wind. When he came in, I carried some letters to him to frank, intending to send them to the Post Office. He franked the letters, but said the weather was too bad to send a servant to the office that evening. I observed to him that I was afraid he had got wet; he said no—his great coat had kept him dry; but his neck appeared to be wet—the snow was hanging on his hair.

He came to dinner without changing his dress. In the evening he appeared as well as usual. A heavy fall of snow took place on Friday, which prevented the General from riding out as usual. He had taken cold (undoubtedly from being so much exposed the day before,) and complained of having a sore throat; he had a hoarseness, which increased in the evening, but he made light of it, as he would never take anything to carry off a cold,—always observing, 'let it go as it came.' In the evening, the papers having come from the Post Office, he sat in the room, with Mrs Washington and myself, reading them, till about nine o'clock; and when he met with anything which he thought diverting or interesting, he would read it aloud. He desired me to read to him the debates of the Virginia Assembly, on the election of a Senator and Governor, which I did. On his retiring to bed, he appeared to be in perfect health, except the cold which he considered as trifling—he had been remarkably cheerful all the evening.

About two or three o'clock on Saturday morning, he awoke Mrs Washington, and informed her he was very unwell, and had an ague. She observed that he could scarcely speak, and breathed with difficulty, and she wished to get up and call a servant; but the General would not permit her, lest she should take cold. As soon as the day appeared, the woman Caroline went into the room to make a fire, and the girl desired that Mr Rawlins, one of the overseers, who was used to bleeding the people, might be sent for to bleed him before the Doctor could arrive. I was sent for—went to the General's chamber, where Mrs Washington was up, and related to me his being taken ill between 2 and 3 o'clock, as before stated. I found him breathing with difficulty, and hardly able to utter a word intelligibly. I went out instantly and wrote a line to Doctor Plask, and sent it with all speed. Immediately I returned to the General's chamber, where I found him in the same situation I had left him. A mixture of molasses, vinegar and butter, was pre-

pared, but he could not swallow a drop; whenever he attempted, he was distressed, convulsed, and almost suffocated.

Mr Rawlins came in soon after sun rise and prepared to bleed him; when the arm was ready the General observing Rawlins appeared agitated; said with difficulty 'don't be afraid,' and after the incision was made he observed, the office was not large enough—however the blood ran pretty freely. Mrs Washington not knowing whether bleeding was proper in the General's situation begged that much might not be taken from him, and desired me to stop it. When I was about to untie the string, the General put up his hand to prevent it, and soon as he could speak said 'more.'

Mrs Washington still uneasy lest too much blood should be taken, it was stopped after about half a pint had been taken. Finding that no relief was obtained from bleeding, and that nothing could be swallowed, I proposed bathing the throat externally with sal volatile, which was done; a piece of flannel was then put round his neck. His feet were also soaked in warm water, but gave no relief. By Mrs Washington's request I despatched a messenger for Doctor Brown at Port Tobacco. About 9 o'clock Doct. Craik arrived, and put a blister of cantharides on the throat of the General, and took more blood, and had some vinegar and hot water set in the tea pot for him to draw in the steam from the nose.

He also had sage tea and vinegar mixed and used as a gargle, but when he held his head to let it run down, it all most produced suffocation. When the mixture came out of his mouth some phlegm followed it, and he would attempt to cough, which the Doctor encouraged, but without effect. About 11 o'clock, Doct. Dick was sent for. Doct. Craik bled the General again, no effect was produced, and he continued in the same state, unable to swallow anything. Doct. Dick came in about 3 o'clock, and Doct. Brown arrived soon after; when, after consultation, the General was bled again, the blood ran slowly, appeared very thick and did not produce any symptoms of fainting. At 4 o'clock the General could swallow a little. Calomel and tartar emetic were administered without effect. About half past 4 o'clock he desired me to ask Mrs Washington to come to his bedside, when he desired her to go down to his room, and take from his desk two Wills which she would find there, and bring them to him, which she did; upon looking at one, which he observed was useless, he desired her to burn it, which she did, and then took the other and put it away; after this was done I returned again to his bed side and took his hand. He said to me, 'I find I am going—my breath cannot continue long: I believed from the first attack it would be fatal. Do you arrange and record all my military letters and papers; arrange my accounts and settle my books, as you know more about them than any one else; and let Mr Rawlins finish recording my other letters, which he has begun.' He asked when Mr Lewis and Washington would return? I told him, I believed about the 20th of the month—He made no reply to it. The physicians again came in (between 5 and 6 o'clock,) and when they came to his bedside, Dr Craik asked him if he would sit up in the bed; he held out his hand to me and was raised up, when he said to the physicians—'I feel myself going; you had better not take any more trouble about me, but let me go off quietly; I cannot last long.' They found what

had been done was without effect; he laid down again, and they retired, excepting Dr Craik. He then said to him—'Doctor, I die hard, but I am not afraid to go; I believed from my first attack I should not survive it; my breath cannot last long.' The Doctor pressed his hand, but could not utter a word; he retired from the bedside and sat by the fire, absorbed in grief. About 8 o'clock, the physicians again came into the room, and applied blisters to his legs; but went out without a ray of hope. From this time he appeared to breathe with less difficulty than he had done; but was very restless, continually changing his position, to endeavor to get ease. I aided him all in my power, and was gratified in believing he felt it, for he would look upon me with eyes speaking gratitude, but unable to utter a word without great distress. About 10 o'clock he made several attempts to speak to me before he could effect it; at length he said—I am just going. Have me decently buried; and do not let my body be put into the vault in less than two days after I am dead.' I bowed assent. He looked at me again and said—'Do you understand me?' I replied—'Yes, sir.' 'Tis well,' said he. About ten minutes before he expired, his breathing became much easier—he lay quietly—he withdrew his hand from mine and felt his own pulse. I spoke to Doctor Craik, who sat by the fire; he came to the bed side. The General's hand fell from his wrist; I took it in mine and placed it on my breast. Doctor Craik placed his hands over his eyes; and he expired without a struggle or a sigh.

While we were fixed in silent grief, Mrs Washington asked in a firm and collected voice—'Is he gone?'

Cocoons Wanted.

The Subscriber will pay cash for Cocoons, from 25 to 30 cents, according to quality. J. H. COBB.
Deiham, July 15th, 1831. 8t July 20.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly hand bound and lettered, at 75 cts. per volume, by leaving them at the Farmer's office. Aug. 3.

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed. Aug. 3.

Published every Wednesday Evening, at \$3 per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

COMMUNICATIONS.

To the Editor of the New England Farmer.

SIR—At the request of one of your subscribers, I send you a sketch of the improvements in Agriculture attempted by Fellenberg, at Hofwyl, in the hope that they may be interesting to your readers, and with the earnest wish that *some one* of them, at least, may imitate this noble example, by combining his efforts for the promotion of agriculture, with the improvement of the beings for whose sake alone agriculture is valuable. I have in my possession a number of documents on this subject in the German, which my occupations do not allow me to translate. If any of your correspondents will undertake the task, they are entirely at your service.

Yours, respectfully,

WM. C. WOODERIDGE.

Boston, Sept 13, 1831.

AGRICULTURE OF HOFWYL.

Among the men who have been most distinguished for devising and executing plans of improvement in agriculture, with an immediate reference to the improvements of *man* himself, none has been more remarkable than Fellenberg, of Hofwyl.

He arrived at maturity, in the midst of the French revolution. His attention had early and constantly been devoted to the inquiries and observations concerning the state of society, and the means of improving it; and he had travelled over Switzerland on foot, to make himself familiar with the state and condition of the inhabitants. His investigations of the state of the common people, his intercourse with public men, and the tremendous convulsions he had witnessed, had all conspired to impress upon his mind the same conviction—that the only resource for meliorating the state of his own and other countries, and for preventing a repetition of the horrors of revolution he had witnessed, was to be found in early education; and he resolved henceforth to devote himself to this as the object of his life. He was at one time a member of the council of education of Berne, but was soon convinced that nothing adequate could be accomplished on this subject, through the medium of legislative commissions; and having come into possession of an ample fortune, he resolved to devote this to his great object, and to form on his own estate, and on an independent basis, a model institution, in which it should be proved what education could accomplish for the benefit of humanity. In pursuance of his great design, he soon after purchased the estate called *Hofwyl*, and his life, henceforward, forms an important page in the records of benevolent enterprise. His great object was to elevate all classes of society, by fitting them better for their respective stations, and to render them happy and united, without destroying that order which Providence had appointed, and which the governments of Europe preserved with so much jealousy. He believed it important to collect in one institution the poor and the rich, each with their appropriate means of improvement, and thus to establish proper and friendly relations between them. He considered it of high importance to make agriculture the basis of such an institution.

He regarded it as the employment best of all adapted to invigorate the body; but he also believed that, by elevating agriculture from a mere handicraft to an art founded upon scientific principles, and leading directly to the operations of the great First Cause, it would become a pursuit peculiarly fitted to elevate and purify the mind, and serve as the basis of improvement to the laboring classes, and to society at large. He selected Hofwyl on account of its situation; so insulated as to secure it from the influence of bad examples, yet surrounded by villages which would furnish laborers, and only six miles from the city of Berne. It was an estate of about 200 acres, under poor cultivation, lying on a hill filled with springs, and surrounded on three sides by a valley 80 feet in depth. He commenced with employing a large number of laborers in digging drains in every direction, some even to the depth of 30 feet, which completely freed the arable land from water, and at the same time, were formed into a streamlet round the hill, which served to irrigate its borders and the level below, and convert them into rich meadows. His next plan was to turn up the whole soil to the depth of two or three feet, and then replace it, putting the stones and gravel at the bottom, and reserving the richest portions for the surface.

Another object of importance was to convert the swampy ground around into meadows, by covering it about a foot in depth with sand and soil from the upland. This was effected in part by means of the stream we have mentioned, which was made to wash down successive banks of earth placed before it, and in part, during the winter, by sleds descending and raising each other alternately, by means of pulleys, as is sometimes done in coal beds. In connexion with these operations, he erected extensive additions to the granaries (then more than sufficient for the actual produce,) to provide for the abundant crops he anticipated. All this excited rancor among his enemies, and alarm and remonstrances among his friends; and those of his family who were connected with him, left him, by his advice, to sustain the burden alone. In order to obtain ample supplies of manure, he commenced the system of stallfeeding, with a large number of cattle, which were constantly supplied with fresh grass, instead of being suffered to feed in the pastures; and erected ample reservoirs for solid and liquid manure of every kind, the care of which occupied a part of every day's labor. A system of four years' cropping, with deep ploughing, and the invention of superior machines for breaking up the soil, weeding and sowing, insured him success; and the lands of Hofwyl have been made to yield *far more than their former produce*, with an *uninterrupted succession of crops*. The labors of the plough require only half the number of animals formerly used, and the fields of grain produce nineteen fold the amount of the seed sown. The system of agriculture has been fully tested, by repeated visits of distinguished men of science, and the commissioners of various governments of Switzerland and Germany, and its economical results fully ascertained, as exhibiting, in a striking manner, how much larger an amount of nourishment may be drawn from a given portion of soil than has been

generally supposed. Hofwyl has furnished experimental farmers to a number of princes and noblemen, of various parts of Europe; and its pupils have been employed in the formation and direction of some important agricultural institutions. An establishment was also formed for the manufacture of his improved instruments of agriculture, which have been sent to every part of Europe. At successive periods, additions have been made to the domain of Hofwyl, increasing it to about 600 acres, which have furnished all the varieties of soil and situation necessary to render the whole a complete experimental and model farm. But Fellenberg occupied himself in improving agriculture, only as a means to the more important end of improving man himself; and during the whole period that he was thus actively engaged in this subject, he was not less engaged in organizing the institutions of education, which form the great object of his life, and the chief glory of Hofwyl.

YELLOW SPANISH CHERRY.

To the Editor of the New England Farmer.

DEAR SIR—It is now above a year since some communications were inserted in your paper by Adams Foster, Esq. and myself on the subject of the Yellow Spanish cherry. I did not fully understand that gentleman's first communication, but supposed he was impressed with the idea that no fruit of that name had been long known in Europe, and answered it accordingly. This second communication being more explicit I have made the question of *synonymy* a subject of investigation, and I am now convinced that the Yellow Spanish, the Graffen, the Bigarreau of Forsyth and of English collections generally, and the Cerise Ambrée of DuRoi are the *same fruit*. It will be noticed as a matter of particular surprise that the cherry, universally known by English writers for a very long period as the Bigarreau, has *no one of the peculiar characteristics* which distinguish that class of fruits, and is even of a *different species*. I will now conclude my remarks on the subject by stating it as my belief that the *original* Yellow Spanish Cherry of Tonnefort, Miller, &c, no longer exists, as I do not find it in any modern catalogue, not even in that of the London Horticultural Society. The cherry heretofore called in my catalogue Yellow Spanish, I received in the year 1802 by that name from the Nursery of Mr Thompson of London, which was then considered the most worthy of confidence.

Your obedient servant, WM. PRINCE,

Lin. Bot. Garden, N. Y.

FOR THE NEW ENGLAND FARMER.

QUERIES.

1. Are there any varieties of Pears, of which the most of the seeds are not abortive?
2. What kinds produce good seed in the greatest abundance?
3. Will not the present disease in St Michael pear trees affect the scions, and the fruit, of other sorts grafted into St Michael stocks? This is an important question, as thousands are grafting over their St Michael trees?

NEW HAMPSHIRE.

September 17, 1831.

FOR THE NEW ENGLAND FARMER.

CULTURE OF HEMP.

Mr FESSENDEN—A very considerable interest having been felt by individuals, in different parts of New England, on the subject of growing Hemp, I am induced to offer you my experience in the business, hoping that if it should not prove useful, it will, at least, be acceptable to your readers.

The distance at which we live from the sea board and from navigable waters, and the want of a ready cash market for the produce of our tillage lands, led me to consider Hemp as a profitable acquisition, especially upon the intervals bordering upon our rivers.

The last week in May, 1829, I sowed, in drill, about three acres of poor grass land, broken up only a few days before, and harrowed. The rows were from two to three feet apart, and three to four quarts of seed sown on an acre. We paid very little attention to it, during its growth, hoeed a part of it once, to keep down the weeds.

The crop was small, yielding in all, about 25 bushels of seed. I think an acre of good land, well prepared and hoeed, would have produced as much as the whole of this, in the manner we conducted it. At the same time, I sowed a bushel and four quarts of seed, on half an acre of meadow land, in good till, sown broad cast. From this I had a fair crop of stem. The seed sown and planted, this year, I procured from Burlington, Vermont, at 4 dollars a bushel.

On the 25th of May, 1830, I sowed 12 bushels of seed, broad cast, on about four acres and three quarters of land. One acre was land long used for pasture, on which, however, a crop of rye had been grown the year before, which had never been manured, to my knowledge. The crop was small, some part of it so short that I did not think it worth cutting. The remaining $3\frac{3}{4}$ acres was good meadow land though not rich. It had been planted with corn and potatoes the year before and tolerably well manured. It was prepared for the Hemp crop by being ploughed once and harrowed, with out manure. It produced what I considered a fair crop, varying in its growth according to the quantity of the land in different parts of the field, from three to seven feet high, when fully grown. The produce of this year, I estimated at five tons of stem, when dry. We cut most of it with a common grain cradle. We pulled the longest part of the stem and when bonal and dry, cut off the roots. After drying and securing it from the dews for two or three weeks, we commenced water rotting, by sinking the bundles in a small artificial pond prepared for the purpose, large enough to contain, with convenience, a ton and a half, at a time. In September, the weather being warm, twelve days was sufficient time for rotting. Late in the season, I let it remain in the water from fifteen to eighteen days.

Of this crop I prepared for market in the spring of 1831, 1425 lbs. which I sold to Mr Edward Adams, cordage maker at Charlestown, at 209 dollars a ton, amounting to \$132,91

The expense of this I estimate as follows:

12 bushels of seed at 1,50 per bush.	18,00
Use of $4\frac{3}{4}$ acres of land, including taxes 4,00	10,00
Ploughing and sowing, 1,50 per acre, 7,12	
Harvesting—1 days cradling 1,00	4,00
12 days other labor in pulling, binding and securing, including board 4s.	12,00

Rotting, spreading, drying, binding and securing, 19 days, including board 4s.	12,67
Expense of breaking and dressing, equal to one third of the crop	44,31
Freight to market, at 75 cents per 100 lbs.	10,68
	123,75
	9,16

I have remaining about one ton of stem, which would produce, probably, 3 cwt. of dressed hemp; give one third for breaking and dressing and we have two cwt. of hemp. At the above price \$26,50 deduct freight 1,68

Leaving

\$28,88

The small crop raised in 1829, was prepared and sold, with the above, but the amount kept separately.

From this experiment, I am satisfied that our climate, and the soil of our interval lands, are well adapted to the growth of Hemp. The best of our land with good cultivation, is necessary, to insure a profitable crop. It is a waste of time and expense, to put it upon poor land. It is an exhausting crop, as much so, as flax, or any of our largest crops. And without some cheap and convenient machinery for breaking and clearing, Hemp cannot be made an advantageous crop, where land can be enriched, or kept in good till, only, by expensive labor in manuring and tillage.

Natural meadows or drained swamps would probably produce several successive crops of Hemp without manure. And with the aid of some cheap machinery (which might be devised) it would answer well, as a cash crop, when grain is plenty and cheap. The greatest difficulty which I experienced in preparing my crop so as to make it equal to Russia Hemp, was, in separating the shive from the fibre. In Russia Hemp, the fibre seems entire, yet free from shives, which in mine, with much exertion in hand-dressing, a considerable portion of shive remained.

I am, Sir, respectfully, your obedient servant,
JOSEPH SAWYER

Piermont, N. H. Sept. 8, 1831.

Horticulture.

FRUITS EXHIBITED.

Apples.—By E. Bartlett, Esq., Ribstone Pippin, Newton Pippin, Spitzenburgh, Margil, and a very dark colored variety, name unknown.

By Mr Joy, Boston, specimens of the Golden Pippin and Golden Reinette.

Pears.—By Andrew Brimmer, Esq., Boston, a very beautiful cluster of Cassane d'Brete.

By Mrs Parkman, from her garden in Bowden Square, Boston, a specimen of very large Broe's Bergamot.

By Mr Joy, Boston, beautiful Brown Beurre, By E. Bartlett, an uncommonly large specimen of the Bartlett Pear.

By Mr R. Toohy, Waltham, Catilae, from a French tree.

By Mr M. S. Fowle, Watertown, a sample of very good pears, said to be native.

By Mr E. Vose, Capiaumont and Long Green.

By Mr R. Manning, Orange Bergamot, melting but not high flavored; Williams' double pear, from the garden of Mrs W., a melting pear; Cle-

mont, resembling the Autumn Superb; Seedling, from garden of J. W. Treadwell, Esq., a pleasant juicy variety; Musk, Spice, or Rousselet de Rheims; Raymond, from seed by Dr Joseph Wright, of Raymond, Me., very melting, (rather over ripe); Beurre Coloma, not high flavored, but ripened under great disadvantages; and Autumn Bounty, (native) Naumkeag, (from the garden of J. W. Treadwell, Esq.) very fine, melting and productive; Tucker's Pear, so called, by Mr Samuel Hyde, Newton, greatly resembling the Autumn Bounty; also, a variety, said to have been raised from seed in Andover, Mass.

By E. M. Richards, a specimen, called by the late Ebenezer Preble, Esq. French Red; in appearance it resembles the Catilae, but of much higher flavor.

Peaches.—By Mr E. Vose, Morris' Luscious white.

By Mrs S. A. Otis, Boston, very fine Seedling.

By Mr Moses Everett, Boston, a beautiful specimen of Clingstone.

By Mr John Clapp, South Reading, a basket of handsome Seedling Clingstone.

By Mr William W. Wheelton, Charleston. Seedling Clingstone, much resembling Lemon Clingstone.

Grapes.—By Mr C. Cowing, Roxbury, three clusters, weighing 11-12 lbs. each, of Black Cape, for premium; the berries were large and fine—out door culture, girdled.

By Mr C. Senior, three bunches, weighing nearly 2 lbs. each, of Black Hamburgh, for premium—very large and fine; they were from the garden of Mr Haynes, grown under Mr Senior's direction. Also, by Mr Senior, Gos. Maroc, Purple Muscat, and Morillon.

E. M. RICHARDS,
For the Committee.

Horticultural Hall,
Saturday, Sept. 17, 1831.

To the Committee of Fruit and Fruit Trees.

GENTLEMEN.—The grapes I presented to your board on Saturday last, for premium, were three out of seven clusters, the production of a vine purchased of the Messrs Winslip in the Spring of 1829, then, one year from the cutting, and by them called the *Black Cape*.

The vine is situated in an open exposure, enclosed only by a rail fence. Respecting the management, I do not now that it has been anything unusual; uncovered last day, tied to an open three barbed trellis and on the first appearance of bud thinned to the three clusters. On the first of July, girdled the vine (as recommended in Fessenden's 'New American Gardener') below four of the clusters, including the three above mentioned, and I can perceive no injury done the other bunches by so doing—a fact by the way which I intend you shall decide for yourselves.

Your obedient servant.

CORNELIUS COWING.

Roxbury, Sept. 19, 1831.

The Horticultural Festival is celebrated this day and a dinner provided by Col. Eaton at Concert Hall.

Profitable Cures.—The following statement of the proceeds of two heifers is furnished for publication by a friend.

Proceeds of two Heifers belonging to Mr Parker M. Dale, of this town; one of two, the other three years old.

The one of three years, calved July 9th, 1830, the one of two years old, calved Aug. 1, 1830—the three year old one's calf was taken from her the 20th day of Aug. 1830, and the other, Aug. 30, 1830.

From Aug. 20 to Nov. 26, and from Aug. 30 to Nov. 26 (186 days) was made from their milk, butter, at one shilling per pound, to the amount of \$24,33

The milk of the two heifers from Nov. 26, 1830, to May 29, 1831, being 257½ gallons, was sold for one shilling per gallon amounted to \$42-92, and the two calves were sold for \$7, making \$76,25

The two heifers calved again, one in June and the other July, 1831, and they were sold for \$88 making the total sum realized from the two heifers, \$98.91.

During all this time, the family was supplied with milk, of which no account was made.—*Newburyport Advertiser*.

A valuable Cow.—In Waltham, a cow eight years old owned by Nathan Sanderson, has yielded the following quantity of milk in one year, viz: From May 24, 1830, (when she calved) to Oct. 23, 612 gallons.
From Oct. 23, to Dec. 2, 104½ do.
From Dec. 2, to April 20, 331 do.
From April 20, to May, 21, 93½ do.

1141 gallons.

It being an average of 3 46-365 gallons per day. Her quantity of milk per day at the present time is ten quarts. She is expected to bring another calf March 4, 1832. Her milk in one week furnished 13 lbs. of butter.—*Boston Patriot*.

From the Genesee Farmer.

For a particular purpose, soon after the young grapes were set, I loosened some of my vines from the trellis, and let parts of them lie on the ground, so that many of the bunches had the soil dashed over them in heavy rains. Not one of these bunches, has any appearance of mildew, while on the same vines at the height of one foot or more many are damaged by that blight. Several kinds of grapes are included in these remarks, such as the *Sweet water*, *Miller's Burgundy*, *Black Orleans*, *Red Color*, &c.

I state the fact for the purpose of calling the attention of horticulturists to the subject, before the season for extending such observations shall be past. I have not much to say in regard to the cause. There are some bunches near the ground so protected by the leaves as to have been scarcely soiled at any time, and yet are free from mildew; and so are some higher on the vines. It may be therefore difficult to come to any positive conclusion, although the first idea that presents is, that our *calcareous loam* is destructive to the mildew when it comes in contact. We may next inquire whether grapes that lie on the ground, are free from mildew in other soils? and whether the same result may be expected in other seasons? D. T.

New England Glass Bottle Company.—This company went into operation in January, 1827, and the manufacture of glass bottles, of every description, has since been very successfully prosecuted. There are now manufacturing one hundred and fifty gross of bottles per week, which far exceeds the amount made in the same time by any other factory in Europe or America. A hydraulic press, for testing the strength of the bottles, has been obtained, which operates with perfect equality on every species of bottle submitted to its operation. A table is given of the comparative strength of English, Bristol, and American, Boston, porter bottles, by which it is shown that the latter are altogether superior to the former. The same results were elicited in regard to the comparative strength of French claret and champagne bottles, and those for the same purpose of American manufacture. Let those concerned, patronize the American product.

Not Farms, &c.—There is no surer index of a Farmer's qualification as a good husbandman, than the external appearance of his domicile. Tight barns, strong fences and walls, gates in order, clean door yard, a house with unbroken windows and water proof, spacious wood sheds, &c., are certain indications that a snug industrious Yeoman lives within; the free use of white wash and paint shows that he has some taste, and a clean door yard that his boys are never idle. Of this description we have many in this town, but we wish there were more. We advise those who are indifferent to these improvements to visit the farm of our townsman, Mr. ABEL B. HEYWOOD, where they will find all that we have enumerated above; if they do not then blush for their own slovenly management at home and resolve to follow his praise worthy example, we shall set them down as unworthy of being ranked as members of the Middlesex Agricultural Society.—*Concord Gazette*.

At a recent meeting of the Horticultural Society a paper was read, entitled, 'An account of the different modes of keeping fruit, which have been tried at the Society's garden for the season, 1831.' The statement was drawn up at the garden, and enumerated eight different modes; the three best, and most practicable of which were, the covering of the fruit in pure and perfectly dry sand, dry fern, or in a deal box buried in the earth. By any of these modes it was preserved, free from shrivelling and any disagreeable flavor—in all it must be deposited in a cold situation. By the other five modes, although the fruit was preserved in a pretty sound state, a musty flavor was found to be communicated; this was especially the case where oat chaff was the medium.

Railroads.—We should suppose if anything would arouse our citizens from their indifference towards public improvements in general and rail roads in particular, it would be such matter of fact statements as the following from the Albany Daily Advertiser. The number of passengers on the Mohawk rail road is now about 500 daily; and when the locomotive runs, it will be doubled, in as much as there are now stages running at the intervals of time to accommodate those who do not arrive at the three stated hours, to which by the use of horses the company is now confined. The Manchester road realized to its proprietors, \$90,000 in nine weeks. This one, (half its length) will go near realizing half this amount in the same time. At the present rate of travel it will be about \$31,000, and if it increases, it will come up to \$45,000, or nearly so, for the nine weeks!—*Traveller*.

Another rail road.—We are authorized and requested to state, that at a meeting of stockholders of the Albany and Schenectady turnpike company on Saturday last, in the city of Albany, it was resolved to construct a rail road on or near the site of the present turnpike, with all possible despatch. We understand it is intended to make a double track with a McAdamized road between, twenty feet wide.—*Id.*

Rail road stock.—The stock in the Philadelphia, Germantown, and Norristown Rail Road, has advanced ten dollars for five paid. A few weeks ago it was sold for 7,62½.

Grapes.—We were shown, yesterday, a cluster of large White Grapes, raised in the garden of Mr. JAMES B. SULTAS, which weighed two

pounds and fifteen ounces—and which, with a smaller cluster, weighed, more than four and a half pounds. They were rich and luxuriant—and while they were permitted to remain on our table for examination, we were sorely tempted to emulate the example of mother Eve. Nevertheless, unlike her, we refrained.—*Con. Mirror*.

CATERPILLARS.

We are sorry to notice the extension of this destructive insect far and wide over fruit and forest trees around us; its ravages have never been known so sudden and so fruitful as this season presents. A farmer called upon us the other day and stated that he had just returned from a woodlot, many of the trees of which were entirely divested of their foliage; there is scarcely a fruit or forest shrub in this town, which does not present one or more clusters of their offensive and injurious nests. But two or three weeks have elapsed since we first noticed their appearance, and now the eye can scarcely rest upon any foliage which has not its accompaniment,—a Caterpillar's nest.

Now, it appears to us, that unless a speedy and efficacious remedy is applied for their destruction, that a most grievous evil will be entailed; it is supposed the continued moist atmosphere has been instrumental in producing them, and before they have opportunity of depositing their eggs, they ought to be thoroughly destroyed, otherwise, the next season will bring out its renewed host; the best remedies which have been suggested may be familiar to every farmer's ear, but yet they may forget its practice; a swab made of coarse rags on the end of a long pole, well saturated with soap-suds or the cheapest oil, will wholly destroy them—we devoutly wish it might.—*Northampton Courier*.

The Boston Patriot says—Dr King, of North Carolina, a philosopher of considerable repute, who has lectured in this city for some time past, maintains a new theory respecting lightning rods, that they should not be smooth, but rough and jagged, that each small point may detach its portion of electric fluid. It is said that the rod upon the State House is altered in this manner.

[We would here recommend Robinson's improved insulating Glass blocks, for securing the rods to buildings, which we consider the greatest improvement, in fixing up lightning rods that has taken place. They can be had at the Agricultural Warehouse, Boston.]

PEACH GRUBS.

This is the proper season to examine the roots of peach trees for the purpose of destroying the young grubs, as the eggs which were deposited by the fly, are all hatched out at this time, and a little attention will destroy them. As they have not buried themselves deep at this season, boiling water poured into the crown, after removing the dirt will destroy most of them; the remainder after a few days should be dug out with the point of a knife. Their hiding places may be easily discovered by the gum which exudes being filled with red dust, like saw dust. A little attention spring and fall will secure your trees against this enemy to peach trees.—*Genesee Farmer*.

A steam cotton factory of 4300 spindles is erecting at Providence, and a similar one at Newport; both of which it is expected, will commence operation the present year.

AN ADDRESS

Delivered before the Hartford County Agricultural Society, at their Annual Meeting, October 2^d, 1830.

By CHARLES ROBINSON, Esq.

On occasions like the present the audience are often entertained with a history of agriculture. The writer traces the art through its rapid advances and its occasional decline, and ends with a glowing picture of its present state amongst us. He often describes the farmer as free from the cares and anxieties which assail all other mortals. He portrays him as possessed of manly independence, as master of his own time and movements, occupied in it true in the direction and superintendence of his business, but still with thoughts intent upon the beauties of nature, as viewing with delight the verdure with which nature has so lavishly invested the surface of the earth, as mingling with grateful emotions upon the opening flowers, upon all the works of a kind providence, and as dwelling under his own vine and fig tree, with none to molest or make him afraid.

What is the use or where is the policy of investing this subject with the mantle of sentiment? of decking it in colors foreign to its nature, with a false and deceitful chain around it, exerting an influence most unwholesome and improper.

In answer to a traveller on a devious and difficult road would you tell him that onward all was plain and pleasant, that there were no doubtful turnings, or rather would you not describe to him with precision the difficulties and dangers he was about to encounter, would not he be more on his guard and better prepared to overcome those dangers, and difficulties if they were fully and freely pointed out to him. If you say to the farmer that his path onward is fair and beautiful, what motive do you place before him for exertion? But if on the other hand you tell him in the language of truth that the course he is pursuing is one of labor and trouble, will not he put forth the energies of his nature and rise superior to the ten thousand cares which beset him on every hand.

The path which the farmer treads is a devious path. His is an occupation which can be learned only by practice and experience. General rules and maxims are of little use. They are liable to so many exceptions, so many different circumstances, concur to alter and change the premises that no conclusion can ordinarily be drawn which upon application will not prove erroneous.

Most of the treatises on this subject are written upon the presumption of more information than farmers in general possess and hence are of no value except to a few. Many of them are the productions of speculative enthusiasts who mistake the workings of their own distempered imagination for the conclusions of scientific research and the results of experience.

In agriculture no two cases occur which in all respects are exactly alike. The external appearance of land affords no sure indication of its true quality and value. This can be fairly tested only by experience, and the application of various crops in successive years, and in general there are so many kinds of soil in the same inclosure, which from their situation must of necessity be subjected to the same mode of treatment, that it is difficult to adopt any one course which will be equally beneficial.

The life of the farmer is frequently spoken of as devoid of care. But is it forgotten that his labor is performed under a capricious sky, that his

crops depend upon an auspicious seed time and a proper state of the soil, neither to be obtained without much labor, care and attention, that his stock are subject to disease and death, that his premises are liable to be entered and his crops destroyed, that a profusion of rain or drought are alike destructive, that blasting and mildew prey upon his hopes, that the whirlwind and the hail in one short hour may cut off and destroy his prospects for the season, that the ten thousand vicissitudes unmet and unnoticed by the professional man, the merchant and the mechanic are a death blow to his labor and his hopes, and that no mortal is exempt from sickness and sorrow. The life of a farmer is a life of toil, of care and anxiety.

The great art of conducting a farm with advantage, with ease and pleasure is the adoption of a regular plan of operation and a thorough and systematic execution of that plan. However excellent a system may be, it is of little value, unless the filling up be in accordance with the general principles. Our happiness depends upon small things. The destiny of nations often turns upon a trifle. Our whole life is a combination of trifles. If therefore each point trifling as it may appear receives due attention the whole subject is properly weighed and considered. But if trifles are neglected and overlooked the whole system falls to the ground.

Formerly, during our agricultural prosperity, great inducements were held out to farmers in consequence of the high price of agricultural products, great improvements were made in the mode of cultivation, and great profits were realized. In fact much of the distress and depression which still prevails in many regions of our country arises from the fact that while produce was high and profits from farming great, much land was purchased by our farmers at enhanced prices, and on a credit, in the full confidence that the exertion of a short period would obtain for them the necessary funds. But the time had gone by, the subsequent depression in the prices of produce cut off the extra profits, while the habits of profuse expenditure acquired under prosperous circumstances still remained, and led to disbursement which the condition of business little enabled them to sustain.

Whatever improvements are now made must be gradual. The great body of our farmers throughout the country think, that if they do not retrograde they do all that can be expected of them, and all that they are able to perform. Hence it is, that they are so little willing to make experiments. The constant dread of falling short, prevents attention to the progress of the science of agriculture, and all desire to participate in the improvement which take place around them.

Experiments should always be made upon a small scale. Their success depends oftentimes upon circumstances trifling in themselves, which can be learned only by practice and experience, and hence it happens that experiments which in peculiar cases and under favorable circumstances are eminently successful, with ordinary care and attention lead only to disappointment and vexation.

There is a rage among speculative men throughout our country for experiments and innovation and many a crude and undigested suggestion is made in our periodicals which if tested by the ardent and unsuspecting might by their utter failure lead to a distrust of all real improvement and a disgust at all experiments.

The general system or outline in every country is undoubtedly that which experience has proved to be the best adapted to the soil and climate and it is only by modifications of this general system, by improvements in the several items that any amelioration can be effected.

Taking therefore our system as it exists among us, it may be useful to examine some of the points in which improvements may be made, and here permit me to remark that in a discourse of this kind it is impossible even to glance at many points all important to the interest of the farmer and also many which affect him in common with the other classes of the community.

In regard to stock, it is of the utmost importance that the best breeds be obtained. The expense of rearing a valuable animal is no greater than that of raising a worthless one, while the profit is increased by some hundred per cent. In the feeding of stock we are not sufficiently liberal. A little extra care and full feed develop qualities in an animal which in ordinary circumstances would not appear.

The farmer who has a liberal supply of roots for his stock at the commencement of fall feeding is much more advantageously situated, all things else the same, than he who depends entirely upon dry feed. He commences feeding earlier in the fall, before his cattle, picking a scanty subsistence of frost bitten herbage are shivering in the piercing winds of November, and is enabled to retain them in his yards longer in the spring. He thus commences the season with great advantage, his stock in high condition, his pastures fresh and abundant.

For the support of stock the common field turnip deserves a high rank, as it is easily raised and yields abundantly. It may not be improper here to suggest a mode of culture not perhaps new, but one which has hitherto in repeated trials been eminently successful. Near the middle of July plough with a deep furrow, land under a strong turf, roll and apply a light top dressing. Harrow thoroughly with a wooden harrow, sow the seed in plaster of Paris between the 25th July and the 6th of August, cover with a light bush. Under this course very great crops of the best quality have uniformly been obtained. The land is also left in excellent condition for a drilled crop the succeeding season.

To be continued next week.

Rail road meeting.—A very numerous and highly respectable meeting was held on Monday last, at the house of Mr Spraker, in the town of Palatine, for the purpose of concerting measures to procure the passage of a law authorizing the construction of a rail road from Schenectady to Utica, on the north side of the Mohawk river. The meeting was composed of citizens from the counties of Albany, Schenectady, Montgomery, Herkimer, and Oneida, and was organized by the appointment of Gen. Weaver, chairman, and Stephen Yates, secretary; after which a number of resolutions were passed and ordered to be published; general and corresponding committees were appointed, &c.—*Schenectady Cabinet.*

The Railway.—Since the opening of the branch of the Liverpool and Manchester Railway from Bolton, there have been conveyed 1545 passengers. The average receipts for fares and carriage of merchandise, is at the rate of £10,000 per annum, and the effect has been to drive every stage coach from off the road between Bolton and Liverpool.

Silk and Silk Worms.

From the Lowell Journal.

SILK MANUFACTURE.

NO. IV.

Cottons and woollens may justly be considered, in a great measure, as articles of necessity, and hence it is not to be wondered at, that many should be of opinion that the United States should not be dependent for them on their commerce with foreign nations, liable to be interrupted by wars, and by various other circumstances. But silk can never be considered in that point of view; it is an article of mere luxury, which governments have sometimes found it prudent to prohibit altogether.

It is certain that the American ladies would be as handsome and as lovely in their muslins and chintzes as they were some years ago, or as when clad in the lustrings, florentines, and Gros de Naples of Italy and France. The men use but little silk in their vestments, and for articles of furniture, silk might be easily superseded by other stuffs not less elegant. It is therefore greatly to be lamented, that America should annually incur an enormous debt for an article of merchandise, that might be so easily dispensed with. But as that cannot be avoided, there is no other remedy than to find the means of discharging it. It is always alarming when there is a great excess of importations from foreign countries over exportations; an excess which must be paid for, either in articles of value, or banknotes. The latter mode of payment never takes place till the former is exhausted; and it cannot be denied that it is as ruinous to nations as to individuals. It destroys credit, which of all articles of commerce is the most valuable.

If a rich and growing article of exportation may be pointed out as an annual set-off to the excess of importations, a real service will be rendered to the United States. This article is at hand, and is American silk.

It appears by the report made to Congress by their Committee on Agriculture, on the 22d May, 1826, that in 1821 the importations of manufactured silks into the United States amounted to \$4,486,921; of which \$1,057,233 were exported; and by a gradual increase in the course of four years, the importation amounted to \$10,271,527; of which only \$2,565,742 were exported, leaving a balance of \$7,705,785 to be paid for. It has gradually increased, and the consumption of the present year may be fairly estimated at 10,000,000.

Fortunately for the United States the nations that supply us with manufactured silks are as much in want of the raw article, as their customers are of their fabrics. France imports annually, to the amount of thirty million of francs, of raw silks; which Great Britain purchases annually to the amount of one million eight hundred thousand pounds sterling. These two sums exceed fourteen million of American dollars.

Here then are two rich and increasing markets offered to the industry of the American people for the sale of their raw silk. They must expect to meet competition with other nations; but the superiority of the American silk will insure them a preference.

The Bengal silk, which England imports to the amount of one half of her whole stock, is defective in its preparation. But for that object, it is probable England would supply herself entirely from that quarter, as Bengal is a part of her do-

minions; of course her Bengal silk can only be employed in the coarser manufactures, while those of Italy are used for the finer and more delicate stuffs.

I conclude from these premises, that the United States have a fair prospect of enriching themselves by the sale of raw silk, if they will raise it in sufficient quantities, and prepare it in the manner required by the European manufacturers. V.

From the Vermont Chronicle.

THE SILK WORM.

This useful little animal, the author of so much luxury and magnificence, is one of the most interesting objects in nature. In its disposition it is perfectly gentle and inoffensive, affording both instruction and reproof, to all who may behold them, and without richly compensating the owner for all the care bestowed upon them.

The egg which produces the worm is smaller than a common sized pin-head, of a bright yellow, which in process of time becomes of a brownish cast. After the mulberry leaf has attained to a sufficient size, the eggs are placed in a room, where if the temperature ranges between seventy and eighty, they will hatch in three or four days.—When they first make their appearance, they are diminutive in size as scarcely to be perceptible, of a blackish hue, varying in complexion as they increase in age.

The process of casting off their skins, which it is said they do four times, is slow, and to appearance somewhat painful. The time of this change taking place may be known by their refusing to eat, rearing their heads, and remaining stationary nearly four hours. They then fasten the extremity of their covering to the table and commence their onward march, the skin separating from about the neck, affording them egress without difficulty.

Each time they appear in a new dress their appetites are sensibly increased, until they attain unto a perfect worm, which will take place at the end of five or six weeks, when they become almost transparent—of a light cream color, handsomely variegated with dark spots. Nearly the whole length upon the back, may be seen at this period, what is thought by some to be a large blood vessel, expanding and contracting at intervals. When the time for winding arrives, they raise their heads and look around for a suitable place to suspend their cocoons, (which, however, is generally made for them by placing near them oak branches or a suitable frame) upon which they commence their task, by fastening on all sides within their reach, a coarse web of silk, to contain the cocoon, which in size and proportion resembles a pigeon's egg, in which they inclose themselves, leaving sufficient space for the free motion of the body in arranging the silk in regular layers of an uniform thickness, which can be seen by cutting the cocoons in pieces. The length of time occupied in its formation is four or five days of unceasing toil; and from the beginning of its labors until the close of life, a period of four or five weeks it abtains wholly from food of any kind. At the expiration of fifteen or twenty days, the worm has been converted into a chrysalis, and from the latter to a beautiful white miller. In that state it is very active, although unable to mount into the air. It moves about upon its feet in small circles, its wings in rapid motion, and after few more days of enjoyment in its new state of existence, it deposits its eggs, to the number of four or five hundred, and closes its eventful life.

The Prospects of the Season.—We have conversed with a gentleman in who has recently made a tour of several hundred miles in this State, and into Vermont. He represents the prospect of crops as very promising. Hay has been as abundant through the interior of the State as it has been in Rockingham county. Corn never looked more promising than at the present time: it is about a fortnight earlier than common. Rye has been somewhat blighted, and the crop is small. In our vicinity, apples are very scarce—but forty miles to the north of us they are abundant. Potatoes are generally not so abundant as last year. The season has been such as will not fail to excite in the farmer, feelings of gratitude to Him who gives the early and the latter rain.—*Portsmouth Journal.*

In Plymouth county a disease called the 'blind staggers,' is prevailing to a considerable extent among the horses, and large numbers have died within a short period. In the town of Middleboro the number that have died is estimated from 70 to 100.

Six large Watermelons were gathered from one vine, on Mrs Dudley's farm, Roxbury—the aggregate weight of the six was one hundred and eighty-seven pounds.

A Pennsylvania paper contains a number of severe strictures upon the wanton practice of shooting small birds, not usually eaten, such as swallows, tomtits, pewees, &c. These birds are useful in destroying insects, and should not be wantonly killed.

Amongst the many advantages which the community have derived from the persevering and well directed industry of the late Mr Parmentier, perhaps the most prominent is the introduction by him in this country of the *Morus multicaulis*, or true Chinese Mulberry Tree; it is the tree from the leaves of which the Chinese feed the silkworm, and which is preferred in France, to any other, for that purpose. His widow, at the Horticultural Garden near Brooklyn, has succeeded in propagating a large number of them, many of the leaves measure 13 inches in breadth, which saves much labor in plucking them; and, besides, the worms fed with them are found to make silk of a stronger and more even texture than those fed on ordinary Mulberry leaf.—*N. Y. Inquirer.*

Lowell Railway.—His proposed course may now be traced by the stakes which have been set, from the borders of Charlestown and Medford to its termination at the basin of the canal in Lowell; from thence it is understood there are to be branches along the several canals to the Factories. The work it is stated will be commenced this fall.—*Lowell Journal.*

Harvard College.—The Corporation and overseers have appointed THADDEUS WILLIAM HARRIS, M. D. of Milton to be Librarian of Harvard College in place of the lamented Hon. Benj. Pierce, and he has accepted the appointment. Mr Harris' father received the appointment to the same office forty years ago.

Rabbits.—It has been said that rabbits may be fed through the summer, with weeds from the garden, and one would judge from the appearance of many of the gardens in this village, that the owners were making calculations for raising these animals.—*Gen. Far.*

NEW BEANS.

Among the new vegetables now under cultivation in the garden of the editor of the American Farmer, there are two varieties of beans well worthy of being introduced into every kitchen garden.—One variety, which we at present call the *Yellott Asparagus Bean*, has a large fleshy pod from 6 to 9 inches in length, very tender and rich. It is a pole bean, excellent bearer and nearly as early as the common bush bean. The other is the London Horticultural Bean—resembling very closely in flavor the pole cranberry bean, but a much better bearer in this climate, and as early as the yellott bean. These two varieties are decidedly superior to any we have heretofore cultivated, both for productiveness and quality. They are both much the best when the pods and beans are full grown, especially the Yellott, which we prefer when the pods begin to assume a yellow tinge.

There is an objection generally urged against pole beans, on account of the trouble of providing poles; but when it is considered that a dozen hills of pole beans will produce more than four dozen hills of dwarf or bush beans, and that one set of poles will last several years if taken care of, we think this objection will be found to be groundless. Pole beans are decidedly preferable to bush beans when there is a scarcity of ground.—*American Farmer*.

HORSES Slobbering.

At this season of the year, when the weather is warm and the earth moist, horses feeding in pasture are often salivated to that extent that it renders it very disagreeable being near them, and instead of gaining flesh they lose it very fast.—The cause of this salivation has been ascribed to their eating a plant which grows in moist ground, called *lobelia*. We conclude this is not the cause of this complaint, as we do not know of any animals but *quacks* who are fond of it. If this was the true cause of it, why do not horses slobber in dry cool weather, when the grasses are not growing so rapidly, or even in damp weather, when feeding in pastures newly stocked down with luscious grass. If a horse, which is troubled with this complaint, is turned into such pasture, the complaint is soon stopped. The salivation is undoubtedly produced by eating white clover when it is very full of juice; and changing the food is the proper preventive. A fasting of hay or oats in common cases will answer, or in extreme ones change the pasture as mentioned before, and it will soon cease.

(It is said that a baiting of *parsley* is a certain remedy, and that if this plant is cultivated along the fences the animals will of themselves take a sufficient quantity to act as a preventive—all grazing animals being very fond of it.—*Ed. Amer. Far.*

TOAST AND WATER.

An infusion of toasted bread in water is one of the most salutary drinks that can be taken by the sick and convalescent. Dr Hancock gives his experience in its favor as follows: He cut a large thin slice of bread, toasted it carefully and thoroughly, without burning; put it, hot from the fire, in a pint of cold water; allowed it to stand a while, and then set it on the fire till it was as hot as tea is usually drunk. He found that five or six cups of this water, with or without sugar, were more refreshing, and sooner took off any fatigue or uneasiness, than any strong wine, strong ale, small beer, warmed coffee or tea, (for he had tried them all, or any other liquor that he knew of.

It is seldom that toast and water is properly made, and we therefore think it proper to furnish our readers with the following recipe:

Take a slice of fine and stale loaf of bread, cut very thin, (as thin as toast is ever cut) and let it be carefully toasted on both sides, until it be completely browned all over, but nowise blackened or burned in any way; put this into a common deep stone or china jug, and pour over it, from the tea-kettle, as much clear boiling water as you wish to make into drink. Much depends on the water being actually in a boiling state. Cover the pitcher with a saucer or plate, and let the drink become quite cold. It is then fit to be used; the fresher made the better, and of course, the more agreeable.

In dyspepsy and a disordered state of the bowels, toast and water ought to be the habitual drink.

PICKLES.

This is the season of the year for pickling; we would recommend the following as the most approved method of preserving cucumbers for this use. After gathering your cucumbers, place them in a suitable vessel, and pour over them a strong brine in sufficient quantity to cover them. Let them remain in this until wanted, when they should be put into water and allowed to remain twenty-four hours. Pour off this water and cover them with water boiling hot and allow them to stand a couple of hours, after which, the same process should be repeated, and if the color should not be as green as wished, repeat it a second time, when they will be found hard and green. Let them be put in vinegar with pepper according to taste.—When cucumbers are prepared as above, they will keep through the season. Some practise putting cucumbers into spirits and water to undergo the acetous fermentation; these never make pleasant pickles. Cucumbers may be kept in strong brine for any length of time, and by so doing, a small quantity can be freshened at a time, and the quantity of vinegar required will be less than when a barrel is prepared at once.—*Genesee Farmer*.

From the New York Farmer.

THE OPINION OF JUDGE PETERS ON CHEAT OR CHEATS.

The late Judge PETERS, President of the Philadelphia Society for promoting Agriculture, one of the most enlightened farmers of the age, gave his opinion of cheat (cheese) as follows:

'I do not believe in the transmutation of grain from one kind to another, more than I credit the transmutation of metals; crossings and hybridens mixtures are to be accounted for, but they proceed from intercourse of perfect plants. Cheat often succeeds, or rather takes the place of, destroyed or abortive wheat. Why? I do not pretend to assign the cause.'

[The cause is readily assigned. The fields of the careless farmers, are well seeded with this grass, waiting for an opportunity to spring up; and no spot suits it better than a rich or moist vacancy in a wheat field.]

'I have known cheat sown, produce cheat; but never changed its kind on frequent repetitions. Plants degenerate by bad, and meliorate by good culture; but DO NOT CHANGE THEIR KIND. Wheat is originally a mean grain; yet it is wheat and not cheat. I have never seen any scientific or botanical description of cheat, so as to induce me to believe it a degenerated wheat, or any variety of

the *Triticum*. Botanists must determine this question.' [Memoirs of the Philadelphia Society, &c. vol. 4 p. 316.]

Botanists,—the only persons who have examined this subject with sufficient care to be qualified to give an opinion,—have long since determined that wheat and cheese are of different genera; and that the notion of a transmutation of the former to the latter, is a vulgar error, fraught with pernicious consequences to the farmer.

D. T.

ON FEEDING HOGS.

Our good farmers find the month of September to be a very important one in regard to feeding their hogs. Those who wish to be economical in feeding, should begin early. Every farmer who is fattening hogs should have a caudron set in an arch near his pen in which he can boil pumpkins, potatoes, meal, &c. as it will be found much cheaper in this section of country to feed with boiled food than to give it to them raw. From the low price which potatoes and pumpkins are sold at in our market towns, and their great weight and small value they will not bear long transport, therefore it is better to feed them to the hogs and save the corn which would be required were they fattened on it, as that is not so perishable an article. When potatoes are boiled and mashed they make excellent feed for hogs; if a proportion of pumpkins are mixed with them they are still better, and if to both a small quantity of corn meal be added, we do not know of any feed with which hogs can be fattened to more advantage. We know that it is said that pork which is fed with boiled food is not as hard, and of course the purchaser will endeavor to take advantage of the circumstance; but let hogs be fed in this manner for the first three fourths of the time they are fattening; the remainder with meal or soft corn; and we assure our farmers that they will find a ready market for their pork, and at first prices. It is well to apprise our readers that pork fattened with still-slops is a different article; soft, and charged with the acetic acid or vinegar from the slops on which they are fed, and from which circumstance it is almost impossible to prevent the pork from turning sour, and spoiling after it is packed in the barrels, unless there is an alkali added to the brine to neutralize the acidity contained in it. From this acidity, pork fed on boiled food as above, is entirely free, and therefore is as easily kept as if fed with corn; and if not quite so hard it cannot operate to lessen the value of it, as the hams will be increased in value as much as the side or messein can be deteriorated. A portion of time spent in gathering up those things which of themselves are not so marketable, and converting them into food for hogs at this season, will save much, that is, more directly so, and will prove equally as profitable as that spent in raising such crops, as the old adage is, 'a penny saved is as good as a penny earned.'—*Genesee Farmer*.

ALBANY HORTICULTURAL SOCIETY.—At an election held on the 6th inst, the following gentlemen were unanimously elected officers for the ensuing year, viz:

E. C. DELAVAN, President.	} V. Pres.
ISAAC DENNISTON,	
STEPHEN VAN RENSSELAER, Jr.	
JOHN T. NORTON,	
JOHN MEADS, Treasurer.	
JAMES G. TRACY, Corresponding Secretary.	
B. P. STAATS, Recording Secretary.	

CATTLE SHOW.

The team of Working Cattle which has been witnessed on former occasions has formed a very interesting part of the exhibition by the Worcester County Agricultural Society. The Trustees of the Society are particularly desirous of seeing at the approaching Farmer's Festival, a favorable exhibition of the working stock of the County; for this purpose they have authorized the Committee of Arrangements to offer for a team of good Working Cattle to consist of not less than six yokes, and all of them owned in the same town, a gratuity of \$25 to defray the expenses of those who may drive them. The Committee would appeal to the public spirit of their agricultural brethren in towns which can, without great inconvenience, furnish such a team, for their exertions to secure an object so much desired. The gratuity will be paid to those who may first give notice of their intentions to exhibit such a team, to the Corresponding Secretary of the Society, provided, that the Committee on Working Cattle shall approve of such team.

The Committee of Arrangements would congratulate the Members of the Society on the prospect of a highly interesting exhibition; they have received assurances from different sections of the County, that the Show for numbers of animals and articles to be exhibited, and for variety and excellence, will exceed that of any former year.

Those who intend to compete in the Ploughing Match are reminded that the notice of such intention must be filed with the Corresponding Secretary on or before the 8th day of October next, and that in all cases a strict compliance with the rules as published in the Society's bill of premiums will be required. The Trustees of the Society have directed a committee to make sale of the imported *Bull Animal*, the property of the Society; it not sold at private sale previous to the 20th October next, he will then be sold at Public Auction. He may be seen at the farm of the subscriber—many of his descendants may be seen on the farm of Governor Lincoln. Inquiries regards the terms of sale, may be made of Gen. Nathan Heard or Benjamin Butman, Esq.

JOHN W. LINCOLN.

Chairman of the Committee of Arrangements.

ESSEX AGRICULTURAL SOCIETY.

The Annual Exhibition will be at Andover, South Parish, on Thursday, September 25th.

All claims for Premiums must be entered with the Secretary, on or before 9 o'clock, A. M., of the day of Exhibition.

All persons intending to claim any of the premiums offered, (excepting those for animals exhibited, or domestic manufactures) are requested to give notice to the Secretary, in writing, previous to the day of Exhibition.

All persons intending to be competitors in the Ploughing Match, must give information thereof, on or before the Monday next preceding the day of Exhibition, and must have their teams ready on the Ploughing Field, on H. Clark's farm, at 9 o'clock, A. M.

The trustees will meet at a Hall near the South Meeting House, at half past 8 o'clock, A. M. to fill vacancies in Committees.

The several committees will be expected to meet, and be ready for the performance of their respective duties, at 9 o'clock, A. M.

The exhibition of Manufactures will be at a Hall near S. M. House, where all articles must be entered and deposited before 9 o'clock, A. M.

The exhibition of Butter, Cheese, and Vegetables, will be in a room provided for the purpose in the same building.

Competitors in the Ploughing Match, who reside more than ten miles from the place of Exhibition, may have their teams taken care of at the expense of the Society, by calling on Mr Thomas C. Foster, of Andover.

All animals or articles entered for premium, must remain under the direction of the Marshals until 3 o'clock, P. M.

The Society will dine together at 1 o'clock. Tickets for the Dinner will be furnished to members of the Society, by Messrs Pettigall and Hoyt, at 75 cents each.

The Society will meet at the Meeting House, at 3 o'clock, P. M. where an Address will be delivered by the Rev. HENRY COLMAN—the Reports of the several Committees will be read, and the Premiums awarded—after which, the usual business of the Annual Meeting will be attended to.

By order of Committee of Arrangements.

J. W. PROCTOR, Secretary.

Andover, Sept. 12, 1831.

Linnean Botanic Garden and Nurseries,—Flushing, near New York.

WILLIAM PRINCE & SONS, Proprietors, announce that the great extension made in their establishment, which now covers near 20 acres, *comparably and regularly filled with Trees, Shrubs and Plants of the choicest kinds*, enables them to offer the various sorts at the *reduced prices* stated in their *New Catalogues*, which will be sent to *any person who may apply for them*—The quality and excellence of the trees are superior to all former periods, and the most scrupulous attention has been devoted to their accuracy, which is invariably an object of their *personal attention*. To Nurseries they will allow a liberal discount and a convenient credit.—All Orders desiring information will be replied to by the first mail.

As many persons are agents for different Nurseries, it is suggested that orders intended for us be particularly specified. Every Invoice sent has a *printed heading and our signature*, and such proof of origin must be insisted on, as we take upon ourselves no responsibility unless such an invoice can be produced. We are therefore careful for conclusive reasons, knowing we have been injured by impositions.

In the next paper some particular articles will be enumerated, highly interesting to the public, of which they have cultivated a large supply to meet the great demand. Orders can be sent direct to the proprietors, or to J. B. RUSSELL, Agriculturist, Boston.

N. B. In the Pomological Manual, just published, above 220 varieties of Pears, 100 of Plums, and 100 of Peaches, are fully described, besides other fruits, that do not concur with the subject can make their selections from a knowledge of the qualities. Sept. 21.

Woodbridge and Willard's Universal Geography.

This day is published, the fourth edition of Woodbridge and Willard's Universal Geography, Ancient and Modern, adapted to the present state of the world. For the use of the higher Classes in schools and Academies, and for private Libraries. Accompanied by both Modern and Ancient Atlases. Modern Geography, by WILLIAM C. WOODBRIDGE, Editor of the "Annals of Education," Author of "Elements of Geography for Schools." Ancient Geography, by EMMA WILLARD, Principal of the Troy Female Seminary.

The present (fourth) edition has been improved by the addition of such recent information of changes, improvements, and discoveries, as have been deemed important. A new folio Map of England, Scotland and Ireland, a Map of the Pacific Ocean, a Chart of the principal Animals of the world, a Geological Map of Europe, and a view of the principal Sections of Canals in the United States, with several new engravings of Public Buildings, Cities, &c. have been added. The Maps of the four quarters of the Globe are from new and improved drawings, and it is believed will be found to possess *peculiar advantages*. The plan of this work, as also of the School Geography by the same authors, (which is claimed to be original,) is well known, has obtained the decided approbation of the most eminent Geographers and Teachers in Europe as well as in our own country. The following opinion of this work from the Rev. JOSEPH H. HARRIS, late of Cambridge University, England, President of Kings College, York, U. C. has been recently received by the Publishers.

"Allow me to return you my best thanks for the copy of your Universal Geography, and its accompanying Atlas—and if I may offer an opinion on their merits, I would characterize them as the most comprehensive, and best methodized, and therefore the most useful work, connected with the subject of Geography, that I have met with; not only admirably adapted to the purposes of instruction, but containing much to render them valuable as a reference at all times."

For sale by the principal Booksellers in the United States.—In this city by CARTER, HENDER & BARCOCK and CROCKER & BREWSTER.

IN Press the fourth Edition of "Woodbridge's Elements of Geography and Atlas" for Schools, with new and improved drawings of the Maps for the Atlas and other important additions.
September, 1831.

Notice.

The Annual meeting of the Massachusetts Horticultural Society, for the choice of Officers for the ensuing year, stands adjourned to SATURDAY, Oct. 1st, at 11 o'clock.

EDWARD W. PAINE,

Secretary, pro tem.

Society's Rooms, Joy's Buildings.

Sept. 21.

Wants a Situation,

A Gardener—a steady, active man, who is perfectly acquainted with every department of the business, and will be highly recommended by some of the most respectable families in the vicinity of Boston having no family but a wife; he will engage as a single man or otherwise. Any commands directed to F. L. care of James Ryan, No. 6, Battery-march street, Boston, will be respectfully attended to. Sept. 21.

Barbous Flower Roots.

For sale by J. B. Russell, No 52 North Market Street, Boston—
A few Double Crimson Penny Roots—50 cents each. Large white Lily Roots, extra size, 122 cents each—\$1.00 per dozen. Hyacinth, Tulips, Narcissus, &c. Sept. 11.

New England Farmer's Almanac for 1832.

Just published by J. B. Russell, at the office of the New England Farmer, 52, North Market Street, and Carter, Hender & Barcock, Washington Street, the New England Farmer's Almanac, for 1832, by T. G. FENNER, Editor of the New England Farmer—the Astronomical calculations by ROBERT T. PAINE, Esq. Sept. 7.

Ammunition

Of the best quality and lowest prices, for spotting—constantly for sale at COPELAND'S POWDERSTORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. (1 Jan.

MISCELLANY.

THE POOR DEBTOR.

He lay upon a lathsome stone,
A bag the pillow for his head—
No straw nor blanket for his bed—
His locks with age were hoar.

'Twas sad upon his blanched cheek
To see what furrows grief had made—
A pair of iron bolts of aid—
Ah! who his woes shall speak?

What was the glorious world to him!
The jewell'd sky? the earth in bloom?
Contented within a living tomb,
Useless was every limb!

As if he were a beast of prey—
The deadly foe of human kind—
Strong bul's and bears his home confined,
Lest he should break away.

His food was scanty, coarse, unchanged;
Through gates he gaped for anal an;
Taverns, cat-throats, his companions were;
From virtue's path he ranged.

Yet in his country's pen and fetters,
If once his blood had free play pour'd
And calmly had borne the sword—
Thus was his recompense!

What was his crime, do you inquire?
The worst of all—'twas poverty!
He owed his neighbor dollars there—
His neighbor bound him in his care!

Not long did that old man remain
In his prison and gloomy cell;
Thanks to a friend, 'what he said play tell?'
'Twas DEXTER that broke his chain!

STATISTICS OF INTERFERENCE AND TEMPERANCE DRINKING.

In an article in the daily papers under this head, it was shown to be probable that the three cities of New York, Albany and Boston pay about 4½ millions of dollars a year for the distilled spirituous liquors which they drink. If the whole Union, say 12 millions of people, should drink at the same rate of expense, it would make 180 millions, which seems incredible and far beyond the usual estimate.

The usual way of estimating these amounts is, by taking the number of gallons consumed. This can be done with certainty by the treasury books at Washington, for the period during the last war, when domestic as well as foreign spirits were subject to excise. By them it appears that the quantity then used was above 4½ gallons to every person.

It is remarkable that about the same result has been obtained on a late investigation in New Hampshire, for 1825. The returns from 38 towns scattered through that state, give an average of 4½ gallons a person. We may say, in round numbers, 50 millions of gallons for the United States.

When we consider that part of this is brandy, gin and rum, and that a great part of the remainder is drank by the glass, we cannot put the whole down at a less average than a dollar a gallon, as cost to the consumers, or 50 millions of dollars: probably it is much more.

If such accounts seem incredible, we will refer the reader to the statistics of a single county (Lancaster) in Pennsylvania, for a corroborating fact. That county has one hundred and eighty-five distilleries and only one hundred and sixty-four grist mills.

Our calculations will convince us of the same truth; for the man who drinks a gill a day, consumes in a year
12 gallons,
½ pint a day, 24 "
1 pint a day, 48 "

On a careful inquiry, it is found that a gallon contains 61 small glasses. The usual grocery price is 3 cents per glass, though steamboats, hotels and respectable taverns charge 6 cents to one shilling. A gallon, therefore, retailed at the lowest rate stated, would cost the consumer \$1.92 cents, which is more than 600 per cent profit on the domestic spirit.

Therefore, the man who regularly drinks at the rate of one gill a day, by retail, pays by the year,

823 04
1 pint per day, 46 08
½ pint per day, 92 16

This shows why the rich come to poverty and the poor to wretchedness and want. All this too in a country where wages are high and provisions low, and taxes next to nothing. Ninety dollars a year upon a laboring man, is a higher tax than the most arbitrary government on earth ever imposed, and yet thousands upon thousands of our laboring people impose that tax upon themselves, and a great deal more.

DUTY OF POST MASTERS.

The following extract of a letter from the postmaster general settles most clearly and definitely a very important point in relation to which we have heretofore suffered grievously from the neglect of too many post-masters to comply with the law and their instructions on the subject mentioned. The remedy to which the postmaster general has decided that we are entitled, is in exact accordance with what we have long believed to be both the law and the equity in the case, and is thoroughly efficient and satisfactory. If post-masters do not give due notice to the publishers, in case any of our papers are not taken from their offices, they are liable to pay the sum which would be due for a subscriber.—*Chris. Adv.*

Gentlemen:—Your letter of the 18th inst. enclosing one from E. T. Bridge, is received at this department; and the post master of Savage mills, Me. will be immediately written to upon the subject.

The duty of post masters is very plainly laid down, upon the subject of which you speak, in the 12th section of the seventeenth instruction of the post office laws. They are bound to give immediate notice to the publishers of newspapers which arrive at their office, and which are not taken out by the persons to whom they are directed. In case they neglect this duty, they are liable to pay the sum which would be due from the subscribers. As to the right of post masters to the papers for the postage, as mentioned by Mr Bridge, it does not accrue until after three months from the notice before spoken of, and it has reference only to the papers sent during and after that time.

I am gentlemen, respectfully,

Your obedient servant,

W. T. BARRY.

Messrs. J. EMMY and R. WEAVER.

Personal Appearance.—This is one of those things of accident, resting with nature. No man or woman can form their own persons, and none should be blamed on this head. The disposition for looking well is ruining half the young people in the world, causing them to study their glasses and paint or patch, instead of pursuing that which

is lasting and solid, the cultivation of the mind. It is always a mark of a weak mind, if not a bad heart, to hear a person praise or blame another on the ground alone that they are handsome or homely. Actions should be the test, and a liberal course of conduct pursued to all. It matters little whether a man is tall or short—whether the blood stains the cheek—or runs in another channel. Fashion makes the difference as to beauty. The fly is as sweet if not as gay as the rose, and it bears no thorn about it. As to appearance, fashion should not be allowed to bear upon that which cannot be changed except by deception, and what indeed in reality it not worth the trouble of being called so, even if it could.

The way to wealth, is as plain as the way to market. It depends chiefly on two words, industry and frugality, that is, waste neither time nor money, but make the best use of both.

He that would be rich with the least labor must have few wants: for he that has little, and wants less, is richer than he that has much and wants more. A tub was large enough for Diogenes, and a world too little for Alexander.

We are ruined, not by what we really want, but by what we think we want. Never go abroad in search of wants; if they be real wants, they will come in search of you. He that buys what he does not want, will soon want what he cannot buy.

Coronets Wanted.

The Subscriber will pay cash 10 Coronets, from 25 to 50 cents, according to quality. I. H. COLB, Dedham, July 15th, 1831. St. July 20.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts per volume, by leaving them at the Farmer's office. Aug. 3.

Fresh White Mulberry Seed.

Just received at J. B. Roswell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed. Aug. 3.

European Licches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine Medical Licches. All orders with receive prompt attention. E. L. S. 21 R. W. 4117.

16, Milk street, opposite Federal-st., Apothecary. August 3.

Published every Tuesday Evening, at 25 cents per annum payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

PEACH TREES.

Amid the general decay of the Peach tree, I have the gratification to perceive that the Jacques Rare-ripe has escaped the contagion. This probably may be imputed to its constitutional health and vigor. All in my grounds have borne fruit in their usual excellence and quantity, while all others of various kinds, in their vicinity have produced but a sickly and scanty foliage.

The cause of this disease I have not as yet satisfactorily ascertained. It may be occasioned by a succession of wet seasons, rendering the sap inert and vitiated. But specific appearances have led me to an inquiry, whether it may not be imputed to some extraneous cause. When I commenced pruning my young trees in the spring, I perceived on most of the young sprouts, generally within an inch from the stem, a dark brown spot covering the upper surface, which seemed to be occasioned by some puncture, but for what purpose I could not ascertain, as I could not detect any embryo insect. Whether the poison, however, which seemed evident, was infused by a venomous sting, or was the effect of vitiated nutriment, was left in doubt. This appearance warranted a liberal pruning where heading down was not to be preferred. In this manner I obtained healthy shoots for budding, or a vigorous top to such young trees as had before undergone the process. The more adult which seemed stricken with the *malaria*, I left to their fate. In no season have my young trees appeared better, and should my friends and neighbors have the misfortune to lose their *chole sick*, my sympathy in their affliction may be mitigated by the consolation of assuring them, that I can amply make good their loss.

The Peach tree, under the common mode of propagating it, is liable to many casualties, and an early exit. The soil and situation as usually cultivated forms a luxuriant and plethoric growth, by which the fruit buds are exposed to the blight of autumnal and vernal frosts; or its branches split and broken by the storms of winter, or the weight of redundant fruit. This would prove a more serious calamity, had not nature provided an early restoration by reproduction of the mutilated tree, or a fresh germination of its fruit. These peculiarities, with the higher quality of the produce, may be an offset for its early decay consequent of high cultivation.

Compared with the Pear and Apple, the Peach is naturally a short lived tree; but I apprehend it will be found as durable as the Plum under a different mode of culture. This I infer from the fact that I have a Rare-ripe which has been in annual bearing, with scarcely an exception, for more than thirty years. The stone which produced it was accidentally dropped in the grass by the side of an open fence, on the north border of my ground, where is had a full view of Wachusett. During this period, except for one year, it has had an undisturbed possession of the sod and soil for ten feet in diameter. It exhibits no symptoms of decay and has but once sustained any material injury

from the winds and storms to which it is peculiarly exposed. The fruit when not too abundant is of common size and flavor: but of later maturity. Within a few days, it has been released from the remains of its heavy load. A severe winter, some years ago caused a general destruction of the peach tree. This alone, on my ground survived the catastrophe; and has since outlived many generations of its offspring.

Worcester, Sept. 19, 1831.

O. FISKE.

FOR THE NEW ENGLAND FARMER.

GREEN CORN STALKS.

MR FESSENDEN—For the last twenty-five years I have pursued a practice, common in this vicinity, of feeding milch cows with green stalks as soon as the corn was well filled, and the utility of the practice I never doubted until the present season. I began feeding this season as usual, but soon found that the quantity of milk was diminished. As the milk of each night was all sold, the exact quantity was known.

I did not then suppose it possible that the stalks could occasion the diminution, but was persuaded by my family to desist from giving them stalks in about 8 or 9 days after I commenced, and they subsisted on grazing in the same pasture in which they were kept while fed as above—and to my surprise the quantity of milk increased. As I paid no attention to the subject until about the time of discontinuing the feeding with stalks I cannot state the precise amount of difference in the quantity of milk, but as near as I can ascertain it was from $\frac{1}{4}$ lb to $\frac{1}{2}$ part of the whole.

My corn was planted in hills and the stalks of about 4 hills per day were served to each cow during the above time.

Should the above be thought worth noticing in your paper I hope it will elicit remarks and information from some one of more experience than Your obedient servant. E. F. WOODWARD.

Newton, Sept. 19, 1831.

PERRY,

The name of a pleasant and wholesome liquor made from the juice of pears, by means of fermentation, somewhat in the same manner as cider from apples.

The best perry for perry, or at least the sorts which have been hitherto deemed the fittest for making this liquor, are so excessively tart and harsh, that no one can think of eating them as fruit; for even hungry swine will not eat them; nay, hardly so much as smell to them. Of these the Bosbury pear, the Barcland pear, and the horse pear, are the most esteemed for Perry in Worcestershire, and squash pear, as it is called in Gloucestershire; in both which counties, as well as in some of the adjacent parts, they are planted in the hedge rows and most common fields.

It is observed by Mr Knight that in the making of this sort of liquor, the pears are ground and pressed in exactly the same manner, as those of apples in the manufacturing of cider; but that it is not usual for the reduced pulp to be suffered to remain any length of time without being pressed. It has never, he says, been the practice in Herefordshire, or the

counties in the vicinity of it, to blend the juices of the different varieties of the pear in order to correct the defects of one kind, by the opposite properties of the other. It is however, he allows, more easy to find the required portion of sugar and of astringency as well as flavor, in three or four varieties than in one; hence, he supposes, a judicious mixture of fruits affords a prospect of great benefit.

In grinding, he remarks, that the pulp and rind of the pear, as in the apple, should be perfectly reduced, and that though no benefit is said to have been derived from the reduced pulp remaining some hours unpressed, he has no doubt but that where all other circumstances are the same, that portion of liquor will for the most part be found the best which has remained the longest under the power of the mill stone.

The juice of the pear and the apple, he says, are constituted of the same component parts, but that the proportions are different. In the juice of the pear the tanning principle is predominant, with a less portion of sugar, mucilage, and tinging matter.

The method of managing this sort of liquor during the process of fermentation, is likewise, he observes, nearly the same as that in cider; but that it does not afford the same indications by which the proper period of racking it off may be known. The thick scum that collects on the surface of cider, he remarks, rarely appears on the juice of the pear, and during the time of the suspension of its fermentation, the excessive brightness of the former liquor is seldom seen in the latter; but that where the fruit has been regularly ripe, its produce will generally become moderately clear and quiet in a few days after it is made, and it should then be drawn off from its grosser lees. An excess of fermentation is prevented by the means used in the making of cider; and the liquor is rendered bright by being strained. The power this substance possesses of fining liquors appears, he says, to be purely mechanical; it is composed of innumerable fibres, which being dispersed over the liquor, attach themselves to, and carry down, its impurities. For this purpose it should be reduced to small fragments by being pounded in a mortar, and afterwards steeped twelve or fourteen hours in a quantity of liquor sufficient to produce its greatest degree of expansion. In this state it must be mixed with a few gallons of the liquor, and stirred till it is diffused and suspended in it; and it is then to be poured into the cask, and incorporated with the whole by continued agitation for the space of two hours. This process must be repeated till the required degree of brightness is obtained, the liquor being each time drawn off, on the second or third day, from its precipitated lees. Not more than an ounce and a half, or two ounces of isinglass, are, he believes, generally put into a cask of a hundred and ten gallons, at once; but were its mode of action purely mechanical, there could be no objection to a larger quantity; but it has also he says, a chemical action on the liquor. It combines with and carries down the tanning principle, and hence, during the process of fining, the liquor is deprived of a large portion of its astringency.

This substance is most readily diffused in liquors by boiling, but by this it is dissolved, and converted

into glue; and its organization, on which alone its powers of fining depend, is totally destroyed. The application of it is sometimes also necessary in the manufacture of cider; though color is seldom wanting in that liquor.

Where perry or cider can be made sufficiently bright without it, he would not by any means recommend its use. The liquor is rendered extremely agreeable to the eye by it; but has always appeared to him to become more thin and acid by its action.

In respect to the 'after management of perry it is the same as that of cider; but it does not bear situations where it is exposed to much change of temperature, so well, and its future merit cannot so well be judged of by its present state. In the bottle it almost always retains its good qualities, and in that situation he would always recommend it to be put, if it remains sound and perfect at the conclusion of the first succeeding summer.'

On the whole the pear furnishes a less popular liquor than the apple, but the tree is capable of being grown on a greater variety of soil, and is more productive, furnishing in the proportion of 600 gallons of liquor to the acre, where the trees are full grown.—*Complete Farmer.*

CEMETERY AT MOUNT AUBURN.

This place was consecrated on the 24th inst. by solemn and appropriate services; but a press of avocations prevented our being present till the ceremonies were nearly concluded. We therefore copy the following notice of the proceedings on this occasion, from the *Boston Courier*.

CONSECRATION OF MOUNT AUBURN.—The following was the order of services at the consecration of Mount Auburn as a place of sepulture, on Saturday last.

1. INSTRUMENTAL MUSIC, by the Boston Band.
2. INTRODUCTORY PRAYER, by Rev. Dr WARE.
3. HYMN, written by the Rev. Mr PIERPONT.

To thee, O God, in future trust,
Our hearts their cheerful incense burn
For this thy word, 'thou art of dust,
And unto dust shalt thou return.'

For, what were life, life's work all done,
The hopes, joys, loves, that cling to clay,
All, all departed, one by one,
And yet life's load borne on for aye.

Decay! Decay! 'tis stamped on all!
All bloom, in flower and flesh shall fade;
Ye whispering trees, when we shall fall,
Be our long sleep beneath your shade!

Here to thy bosom, mother Earth,
Take back, in peace, what thou hast given;
And all that is of heavenly birth
O God, in peace, recall to heaven.

4. ADDRESS, by the Hon. JOSEPH STORY.
5. CONCLUDING PRAYER, by the Rev. Mr PIERPONT.

MUSIC by the BAND.

An unclouded sun and an atmosphere purified by the showers of the preceding night, combined to make the day one of the most delightful we ever experienced at this season of the year. It is unnecessary for us to say that the address by Judge Story was pertinent to the occasion, for if the name of the orator were not sufficient, the perfect silence of the multitude, enabling him to be heard with distinctness at the most distant part of the beautiful amphitheatre in which the services were performed, will be sufficient testimony as to its worth and beauty. Neither is it in our power to furnish

any adequate description of the effect produced by the music of the thousand voices which joined in the hymn, as it swelled in chastened melody from the bottom of the glen, and, like the spirit of devotion, found an echo in every heart, and pervaded the whole scene.

The natural features of Mount Auburn are incomparable for the purpose to which it is now sacred. There is not in all the untrodden valleys of the West, a more secluded, more natural or more appropriate spot for the religious exercises of the living; we may be allowed to add our doubts whether the most opulent neighborhood of Europe furnishes a spot so singularly appropriate for a 'Garden of Graves.'

In the course of a few years, when the hand of taste shall have passed over the luxuriance of nature, we may challenge the rivalry of the world to produce another such residence for the spirit of beauty. Mount Auburn has been but little known to the citizens of Boston; but it has now become holy ground, and

Sweet Auburn, loveliest village of the plain,

—a village of the quick and the silent, where nature throws an air of cheerfulness over the labors of death,—will soon be a place of more general resort, both for ourselves and for strangers, than any other spot in the vicinity. Where else shall we go with the musings of Sadness or for the indulgence of Grief; where to cool the burning brow of Ambition, or relieve the swelling heart of Disappointment? We can find no better spot for the rambles of curiosity, health, or pleasure; none sweeter for the whispers of affection among the living; none lovelier for the last rest of our kindred.

Horticulture.

FRUITS EXHIBITED.

Apples.—By Mr Robert Manning, Haworthian (Pom. Mag. No. 34.) a beautiful apple not in eating. By Ward Pool, Danvers, a variety of large size name unknown.

Pears.—By Madam Dix, from her seedling tree; this pear fully sustains the high character it has heretofore acquired, melting and high flavored, it has borne full the present season and the fruit is larger than the figure which accompanied its description in the N. E. Farmer, weighing from 9 to 10 ounces. By Gorham Parsons, Esq. a specimen of the Sylvauche Verte d'Hyver, a fine flavored excellent fruit. By Mr E. M. Richards, Capshew, By Capt. Stephen Wales, Dorchester, a seedling Pear, called Bowdoin, rather coarse texture and not high flavored. By John Prince, Esq. Beurré du Roi, very melting, pleasant flavor, and one of the best varieties of the season. By Mr R. Manning, Beurré d'Angleterre (Cox No. 28) Sucre Verte and Buffum's Native Pear from R. Ishud; the latter melting and fine. By Dr Kittredge, Portsmouth, N. H. large size green pears, not in eating, name unknown. By S. Downer, Captain-out, large and handsome specimen, Beurré Knox; this last is melting, fine flavor and superior to the specimens exhibited last season. By Francis Wingate, Esq. Hallowell, Me. large size very beautiful pears; the specimen was overripe, and appeared rather dry. By Adams Foster, Esq. Providence, R. I. Knight's seedling pears, they are above medium size, quite melting, and of good flavor and appears well worthy of cultivation, a letter from Mr Foster is annexed.

Peaches.—By Mr E. M. Richards, Columbia, a good peach. By Mr E. Vese, Orange, Clingstone, and Yellow York-rarieripe; the last of very fine flavor.

Grapes.—By S. Downer, Schuylkill Muscadell Troy Grape, and Nazro (Prince's Treatise) and one of the committee has seen bearing vines of the variety called the Buck Grape (cuttings received from Mr Buck) and also of the Winne Grape (the plant received from Albany) and they all appear similar to the first named variety. Gale Grape (Prince's Treatise) which is very similar to what is cultivated in this vicinity for the Morillon. Isabella, a ripe specimen of this popular native variety, which is rapidly increasing in cultivation. Bland transparent, scarcely any pulp, not quite at maturity. By Joseph Balch, Esq. a cluster of white Chasselas—being one of three produced on a graft inserted the 25th April last.

S. DOWNER, Chairman.

Horticultural Hall,
Saturday, Sept. 24, 1831.

Providence, Sept. 16, 1831.

To the Committee on Fruits of the Mass. Hort. Soc.

GENTLEMEN.—With this you will receive a small box containing about a dozen of the 'Knight's seedling' pear.

This is a new variety, a native of this state, and is considered by many to be equal to the St Michael or the Seckle. Were it left for me to deride, I should hesitate before I placed this or any other pear on a *par* with the 'St Michael', nor have I, as yet, seen any variety that possessed the sweet and delicate flavor of the 'Seckle'.

The original tree is now standing on the farm of Mr Wm. Knight of Cranston, in a wild, rocky and uncultivated spot, remote from any dwelling, and until within a few years, has almost remained unnoticed and unknown. Within forty rods of this pear tree, separated by a piece of swampy land, stands another of natural growth, but of no value whatever.

This variety has recently been introduced into 'Dyer's nursery', a thriving establishment, situated in the same town, and it would afford me a pleasure to forward scions or trees in the spring of 1832, if you should think it worthy of cultivation. Respectfully your obedient servant.

ADAMS FOSTER.

P. S. The pears should not be eaten, until they turn yellow.

Silk and Silk Worms.

From the Lowell Journal.

SILK MANUFACTURE.

NO. V.

The manufacturing nations of Europe stand in need of the article of raw silk, which they are glad to procure, even of an inferior quality, from the most remote regions of the globe; while America could supply them with the best and finest to an unbounded extent. I have pointed out two great markets, viz. England and France open to American industry and inviting it to their shores. I shall now show the advantages to be derived from this branch of trade, when once it shall have been fairly introduced into this country.

The celebrated Count Dandolo, by whose labors the culture of silk has been so much improved and extended throughout Europe, does not hesitate to affirm, that the value of silk in Italy, considered as an article of exportation, is twice

equal to that of all other products of that country taken together, and that there is no production of the earth in the markets of Europe, which compared to its natural value or prime cost, offers to the producer a greater net profit than the article of silk.

If then in Italy, the land of corn, wine and oil, the profits on exported raw silk be equal to double the amount of all the other productions of the Italian soil taken together, it is evident that the same if not greater advantages must result to this Country, particularly to the Northern and Middle States, whose productions, are not so rich as those in the south of Europe.

Every person will easily understand that the profits on raw silk will in a certain degree be proportioned to the extent of the means of those engaged in its preparation, and of their establishment for that purpose. If it be on a large scale the machinery may be moved by water, or steam power, which will add greatly to the economy of the business. It is now three or four years since the Italian reel was imported into Philadelphia, and there it still lies, like a fine musical instrument waiting for the hand of the master. Nobody has yet succeeded in making merchantable raw silk either by means of that instrument or similar instruments which have been imported into this country. Many attempts have been made, none of which have been successful. I do not hesitate to affirm that all similar attempts, without the necessary instruction and the skill to be acquired by habits of patience, will forever prove unsuccessful. The great degree of skill and dexterity that is necessary for the management of the cocoons, and for producing the various qualities of silk according to their numerous degrees of fineness, may be compared to the different numbers by which the various qualities of cotton threads used for sewing are designated.

The extent of a filature is calculated from the number of reels that are employed—from ten to five hundred or more. To each reel there must be a woman to wind the silk, and a little girl to turn the crank, unless they are all turned by water or steam. The cocoons, I suppose, may be purchased for twenty-five cents the pound, and eight pounds will yield a pound of silk. The fuel, the cauldron, the pipes, the basin, and necessary apparatus to carry the water to the reels, and the wages of the people, are the internal expenses of the establishment. A good reeler, on a hand reel, can turn out three pounds of silk per day.

The current price of raw silk in England and France is about seven dollars the pound; and if it shall be well prepared in the manner required by those manufacturers, and the quality of American silk shall continue to be as much superior to the silk of other countries, as the few specimens have proved to be, which have been sent to those countries, the value may be increased. The Connecticut sewing silk after it is reeled, twisted, colored, and carried to market, sells for four dollars the pound. In consequence of their want of knowledge of the art, and the necessary machinery, they consume 16 pounds of cocoons to produce one pound of silk—with ten days' labor expended upon it. If the 16 pounds of cocoons can be sold for 25 cents per pound, they will produce the same amount, and save the labor and expense.

V.

From the Baltimore Chronicle of the Times.

The object of the following remarks is principally to explain, what is meant by FLOSS SILK, how made, its use, &c. We hope it will prove interesting to more than one description of our readers.

When Mr D'Homerque arrived in this country, upwards of two years ago, it was said that he had been sent for by a society in Philadelphia, to reel silk from the cocoons, and make floss and sewing silk. If this be true, it shows how little was known at that time of the different arts, which together cooperate in the manufacture of silk. To reel silk from the cocoons, is the business of a female reeler, and if the thing is to be undertaken on a large scale, of a director of a filature. To make floss and sewing silk, is the employment of a silk throwster. For the former business, nothing is wanted but a few reels, with their furnaces and basins, and the work is done in the summer only, under a shed, open to the free circulation of air; the latter on the contrary, requires an expensive and complicated set of machinery, and the labor is performed throughout the year in a large room, of sufficient space to contain the apparatus. Directors of filatures and silk throwsters are men of different professions, and nothing is more rare than to find a person competent to both. The society we allude to, do not seem to have been aware of all this. They probably believed that a single person, and that person a mere operative, might do all these things, with the aid of some simple machinery. Indeed, from a publication of theirs, which appeared in the newspapers at that time, it appears that they sent for such a person from Europe, on failing to obtain a female silk spinner from Connecticut.

Since that period, a great deal of light has been thrown upon the subject. The publications which have appeared in this country, have made their way to Europe, and in consequence of it, silk manufacturers of all descriptions have come to our shores.—A corresponding impulse has been felt in this country, and of all this we are beginning to feel the happy effects. Silk throwsters (whose denomination two years ago was hardly known) are now established in several of our cities; foreign raw silk has been imported in larger quantities than before; for the first time, this year, it has been purchased at our public sales, and it is now undergoing the regular process of throwing, in order to be converted into some kind of manufacture. The first that the public voice seems to call for, are floss and sewing silk; the former because much of it is employed by fringe and coach lace makers, of whom numbers have been for a long time established in our large towns, working silk, imported from foreign countries; and the latter, because it is an indispensable article in all families for domestic use. We shall therefore, make a few remarks on the manufacture of these two articles.

1. *Floss Silk*.—Mr D'Homerque, in his essays, calls by that name the kind of silk which the French call *fil a l'ile*, and which is made out of the floss or outside tow and coarse fibres of the cocoons. But he said nothing of what is called floss silk in this country, either because he did not think it of sufficient importance, or because it is not so immediately connected with the subject of reeling. Whatever his motive may have been, we shall try to supply this deficiency.

Floss Silk, in the sense that we speak of is what

the French call *Soit platte* (flat silk,) so named from its being flat and not round like other silk. It is used in almost every kind of coach-lace and fringe makers' work, in embroidery, and in the manufacture of stockings, gloves, and in general of hosiery. It is reeled like other silk, generally of from 15 to 30, or from 20 to 25 cocoons; after reeling, it is sent to the throwster, who gives it that preparation which constitutes *floss silk*. He doubles the threads according to the size wanted, and twists them in his mill, not like other silk, several times, backwards and forwards, from left to right and afterwards from right to left, but twists it only on one side, and very lightly, so that when it is afterwards boiled by the dyer in order to dissolve the gum with which it is impregnated, it becomes partly untwisted, so as to give it a flat appearance, without, however, making it crispy and unfit for winding, which would be the case, if it had not been twisted in the throwing mill. After boiling it is dyed, and in that state is fit for use.

We have been told of floss silk having been made by some ingenious ladies in the south; which unmyth and unwound had been deemed by coach-lace makers, in this city, superior to imported silk of the same kind, and even purchased in that state at 13 dollars a pound, while foreign floss silk, dyed and wound on bobbins, sold only for ten. We are not disposed to controvert this fact; and shall only say that we have heard but of one or two pounds thus purchased two or three years ago, and we have been told that the ladies, who made that small quantity, soon gave up the undertaking; no doubt in consequence of the enormous length of time that it took them to produce that result, and the waste of the material that it occasioned. We have heard no more since of similar attempts.

2. *Sewing Silk*.—We have little to add on the subject of this article, to what has been said by Mr D'Homerque in his essays, and since in various other publications. It is well understood that sewing silk is made from raw silk reeled from 20 to 25 and even to 40 or 50 cocoons according to the size wanted, and if we believe Mr Boucher, it is more difficult to reel silk out of many than out of a few cocoons—after reeling, it is made into sewing silk by the throwster, and requires a great deal more twisting backwards and forwards, and a stronger kind of twist than any other silk.

We are told that there is no throwsting mill yet set up in this country, of sufficient power to twist sewing silk. Neither that of Mr Edward Brown, at Dedham, Massachusetts, which has twenty spindles, nor that of Mr Ripka, at Manayunk, near Philadelphia, which has sixty, are sufficient for that purpose. But we are also informed that this will soon be remedied, and that a proper set of throwsting machinery is even now in preparation at Philadelphia. There is no doubt that all these things will henceforth be certainly progressing in our country; the art of reeling is all we want to set all the rest in motion. For this we look to Congress, on whom alone depends the promoting or the checking of this astonishing progress.

LARGE ONIONS.

A gentleman of Austinown, has made us a present of Onions of an extraordinary growth. They have grown, from the seed, the present season, to be the largest we have seen, some of them being more than fourteen inches in circumference, and weighing thirteen ounces each. *Austinown pa.*

AN ADDRESS

Delivered before the Hartford County Agricultural Society, at their Annual Meeting, October 25, 1830.

By CHARLES ROBINSON, Esq.
Concluded.

On the subject of horses I speak with hesitation, not because much may not with propriety be said and strong and convincing reasons may not be urged why a better race of horses should be obtained and cultivated among us, and I do speak at the suggestion of those whose judgment may not be called in question.

As I have elsewhere remarked, we do not here need a large race of horses for the use of our farmers. The labor performed by horses among us is light and ordinarily does not require of a horse of moderate size a full exertion of his strength. It is evident that for light work which is to be done rapidly a horse of moderate weight has a decided superiority. He has in fact less labor to perform; he has less weight of his own to support and less effort is required of him to accomplish his task. It is therefore important that in our efforts to improve our breed of horses for domestic use, we should consult compactness, speed and beauty. Beauty, because in all animals a beautiful form is the most perfect; one in which is combined in the greatest perfection all the qualities which appertain to that peculiar animal; all those combinations on which strength and action depend, and because too, beauty will always excite affection, induce attention and care, and be exempt from those over-exactions which in the horse so often result in disease and death.

Why is it that on this point we are thus deficient? Is not our soil congenial to the horse; or is it not rather that those engaged in this branch of agriculture do not feel that solicitude for quality, for good blood and a proper combination of the different points and qualities which constitute a good horse? There are opinions prevalent among our farmers which it would seem a proper attention to the subject would lead them to renounce, but which cannot with propriety be discussed on an occasion like the present.

As food for horses our grass is cut too early, often before it has attained its full growth. Herdsgasses, according to Sir Humphrey Davy, contains a far greater amount of nutriment when the seed is fully formed than when in the blossom, and the experience of all who have fairly tested the subject leads them to the same result. It is said that it left till that time it is not eaten so readily; but is not this an argument in favor of late cutting? When the seed is fully formed a given weight contains more nutriment than when cut in the blossom and a given bulk a far greater weight; hence it follows that to obtain the required amount of sustenance a less quantity is requisite and therefore a less quantity will be consumed. The labor of curing is also lessened and the liability of the hay to subsequent injury almost entirely done away.

The system of drill husbandry, even when in its most favorable form it is applied to the raising of Indian Corn is little adapted to the state of our country. It can be adopted to advantage only where laborers are abundant and manual labor of little value, and even in England it is not considered a profitable mode of culture. In this section of the country our agricultural labor is performed with the most profit upon the broadcast system by the use of oxen. In the country the labor of a team is held as of the same value as that of a day laborer. A team costs a farmer its keeping and the interest

upon the investment; a laborer his board and wages. Here is therefore a heavy balance against manual labor.

Corn can be profitably raised only on land of good quality and in a high state of cultivation. In order therefore to obtain large crops many farmers dress their land so heavily as to essentially injure it and occasion great waste. There is a point in all land, the staple of the soil, a degree of fertility, when not effected by injudicious cropping, which the peculiar combination of the soil produces. This point it cannot be made to exceed by any dressing which does not change its nature, and therefore those efforts frequently made to induce an excess in fertility in favored inclosures so often prove abortive.

The system of dry fallow for grain formerly so prevalent is deservedly falling into disrepute. There are many reasons why on a light soil it is unprofitable. If on ordinary soil the expense of ploughing per acre in the fallow system be estimated at 75 cts. and the harrowing at 25 cts. of the same, the three ploughings and two harrowings amount to \$2.50 cts. per acre for the expense of preparing the ground for a crop of fall grain. But if the grain be sown after one ploughing and be covered by two harrowings we have an expense of \$1 per acre. The latter plan has stood the test of experience through a series of years and has produced an average of better crops than the former, beside leaving the land in a more productive state. The repeated and continued exposure of the soil in the fallow system must be extremely injurious. The gases arising from the decomposition of the vegetable matter are evolved and lost. The surface is exposed to the constant action of the sun, air and rain. The animal and vegetable matter is either carried off by evaporation or washed into the subsoil.

Fall ploughing in ordinary cases can by no means be recommended, a series of experiments upon this point have uniformly led to the same disastrous result. The turf is in the fall much stronger than in the spring and it decays but little through the winter. In the spring the land requires more expense to bring it into proper condition than if it had not been ploughed, and what is more the crops are uniformly light.

These are a few of the points in our general system which may with propriety receive the attention of our farmers. There are other subjects, other items for discussion upon which much might be said. Among these the culture of Hemp and the rearing of silk worms claim particular attention. Here however as in all things else the general rule fully applies; that experiments should always be made upon a small scale.

There is one vice not yet entirely eradicated from among us against which every lover of his country and of his fellow men is bound to use all his influence, one scourge upon society which no language can depict in all its horrors: with a syren voice and in the garb of friendship and sociality it enters unsuspected the abode of temperance and peace. It is met with open arms for it speaks only of kindness. It ingratiates itself with some one member of the family, perhaps him on whom the others are dependent for happiness and support. He listens to the syren's song and his happiness is gone forever. The eyes of his friends no longer beam with unmingled satisfaction at his approach; he reads in their countenances only silent suffering and ruined hopes and he feels that he alone is the

author of all this misery. Oppressed with the consciousness that he has ruined himself and destroyed the peace of his family, he returns for alleviation to the intoxicating draught and finds relief for a time for all those sickening reflections in brutal insensibility.

Look at yonder man, a few years since his heart beat high with the prospect of eminence and the consciousness that on him rested those deep, those pure and fervent affections which strew with flowers the pathway of life but which sorrow and suffering can alone call forth in all their tenderness. What is his history for these short, these solemn years? Oh! tell it not, for it speaks only of blighted hopes, of prospects lost, of affection withered by unkindness and the fond expectation of friends exchanged for sorrow more heart rending than that which encircles the dead.

This insidious foe in its first approach is scarcely perceptible. It then manifests itself in apparently slight and venial offences. But like the little cloud that first betokened an answer to the prayers of the prophet Elijah and which soon caused the heavens to be black with clouds and wind and which deluged the earth with rain, this fell destroyer brings with it desolation and despair and involves its victim in a whirlwind of passion and vicious indulgence.

But why dwell we on themes so melancholy. The syren's song will no longer whisper in the ear of the deluded and degraded victim, *peace* when there is no *peace*. Intemperance even now stands forth in all its hideousness; a moral revolution is abroad over our land which bids the victim live.

Our land is still a favored land. The wailings of famine and the cry for bread are not heard in our streets. Oppression and its consequent miseries are here unseen. All who do what their hands find to do and do it with their might here obtain a competent subsistence.

Our occupation, my brother farmers, is one which requires constant care and watchfulness; but is this a reason why we should remain listless and inactive? Let it rather be our effort to raise the condition of the farming interest, to instill into the minds of all with whom we associate proper principles, to excite for our occupation more interest and for its improvement more exertion and greater efforts.

In Russia it is usual to preserve the natural verdure of hay. As soon as the grass is cut, it is without being spread, formed into a tick, in the centre of which has been previously placed a kind of chimney, made of four rough planks. It seems that the heat of the fermentation evaporates by the chimney; and the hay thus retains all its leaves, its color, and its primitive flavor.

Discovery.—Mr D. C. Tiers, states in the Buffalo Bulletin that he has discovered a substitute for hemp and flax in a vegetable which grows at Syracuse. It was cut down by a farmer mowing and fell into the water. He obtained about 2 ozs. of it near a yard long, in the imperfect state and found it equal to flax for strength and softness. He intends to make a satisfactory experiment and communicate the result.

To preserve Fruit.—Fruit of all sorts may be dried and kept a year or two, without losing their flavor, by wiping them dry, and putting them into a cool brick oven; and occasionally, while drying, grating a little sugar over them.—*London.*

SWAMP MUD.

Were farmers to pay more attention to draining their low lands, they would find it much to their interest. Separate from the advantage of rendering their low lands dry and productive, much manure of the first quality might be taken from the ditches, and when spread upon fallows and other uplands under tillage, would well repay all the expense of ditching. Many seem to entertain the idea, that nothing is worth cutting or spreading as manure, unless it has been collected in the barnyard, or is the excrement of animals.

All vegetable matter undergoing decomposition furnishes food for growing plants, and may be applied as manures. In short, anything, whether vegetable or animal substance, which on being mixed with a soil under cultivation, and which increases the growth of plants cultivated in such soil, is termed manure. Different soils require different substances to be applied, in order to facilitate the growth of plants; thus light sandy soils which are too loose to retain moisture are greatly benefited by the application of clay; and such earths as are comparatively too retentive of moisture, are greatly altered for the better, by mixing with them a portion of sand, so that whatever be the soil, which requires ditching, the earth removed may be carted to a different soil, and be applied as a manure. There is on some farms small swamps or depressions, in which vegetable matter collects, and which cannot without considerable expense be drained; these frequently become dry during summer, when large quantities of manure might be taken out of them. Good farmers will look carefully to those things, but some that are new in the profession, may not be aware of the importance of such deposits and a hint from us may not be considered amiss.—*Genesee Farmer.*

TESTIMONIES IN FAVOR OF WATER,
AS A UNIVERSAL BEVERAGE.

Cheyne, a distinguished physician, who wrote more than a century ago, and who had himself experienced incalculable benefits from the use of water, describes its value with great enthusiasm. 'The benefits,' says he 'a person who desires nothing but a clear head, and strong intellectual faculties, would reap by drinking nothing but water (tepid or cold as the season is,) while he is yet young and tolerably healthy, well educated and of a sober honest disposition, are innumerable: As first, that he would live peacefully till towards an hundred years of age, &c. Secondly, that he would constantly enjoy a clear head, calm, at least governable passions; a facility in intellectual applications, and the acquisition of virtue, &c. Thirdly he would thereby be secured against all the great, atrocious, and frightful distempers; as melancholy, lowness of spirits, wrong-headedness, madness, apoplexies, suffocations, fevers of all kinds, pestilences, pleurisies, &c.'

'If there is in nature a remedy, which deserves the name of universal,' says Hoffman, a celebrated German physician, who lived nearly two centuries ago, 'it is, in my opinion, pure water.'

'Water,' says the Edinburgh Encyclopedia, 'is the natural drink of man, and indeed, of all animals. It is not only the safest and best drink, but however it may be disguised, water is perhaps the only fluid which can answer all the purposes for which drink is required.'

'There can be no question,' says Dr James Johnson of London, 'that water is the best and the

only drink which nature has designed for man; and there is as little doubt but that every person might gradually, or even pretty quickly, accustom himself to this aqueous beverage.'—'The water drinker glides tranquilly through life, without much exhilaration or depression, and escapes many diseases to which he would otherwise be subject. The wine drinker experiences short, but vivid periods of rapture, and long intervals of gloom; he is also more subject to disease. The balance of enjoyment then turns decidedly in favor of the water drinker, leaving out his temporal prosperity and future anticipations; and the nearer we keep to his regimen, the happier we shall be.'

'I have known,' says Dr Rush, 'many instances of persons who have followed the most laborious employment for many years in the open air, and in warm and cold weather, who never drank anything but water, and enjoyed uninterrupted good health.'

Those sudden deaths, which are not infrequent from drinking cold water, in very hot weather, rarely if ever take place, except in persons of intemperate habits.

'In physical strength,' says the Journal of Health, 'in the capability of enduring labor and fatigue, in the vigor and clearness of the intellectual powers, the individuals whose drink is confined entirely to water, far exceed those who substitute for the pure element, distilled or fermented liquors.'

'Would the strong man preserve his strength, and the fair woman her beauty, water will be their beverage, their cordial, their restorative. Is the constitution broken down in drunken bouts, and gouty feasting, to be renovated; water—water alone, unmixed, unspiced, must be the grand antidote, septic draught. If cramps and pain torment, or wakefulness cheat the wearied spirit of its repose, not all the essences of peppermint or mustard for the former, or all the sedatives of landanum, or black drops, or hops for the latter, will be so composing for the time, and unattended by after suffering, as a tumbler full or two of hot water. The nervous lady who refuses to take adequate exercise during the day, and drinks her strong green tea in the evening, may consult her physician, if she be partial to having a listener to her tale of woe; but if she desire to rest well and keep out of the hands of quacks, and spare the nerves of her regular medical adviser, who really wishes her well, she must dilute her tea, take longer walks, and in place of recourse to the landanum vial, try a tumbler full of hot water at bed time. The poor hypochondriac must not hope for easier digestion and a greater flow of spirits by a little wine or other bitters before dinner, and a little wine or brandy and water at, and after this meal. He may as well hope to breathe freer by having his throat a little compressed by a tight band just before he takes a walk, and again a little squeezed immediately after his return. His draughts from the fountain of Hygieia must be in the shape of pure water from the nearest spring or cistern.

Curious Document.—Ministers have at this moment in their possession a list of 1,500 individuals, in or near London, whose private fortunes would pay off the national debt. Of course the list is only interesting, or of value, as indicating the mass of wealth in the country, as one could not have imagined, at first sight, that the private fortunes of any 1,500 individuals in the empire could be to such an extent.—*English Paper.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, SEPT. 26, 1831.

HORTICULTURAL FESTIVAL.

The Anniversary of the Massachusetts Horticultural Society was celebrated on the 24th inst. In the forenoon a well written, learned and elaborate address was delivered to the members of the society and a collection of ladies and gentlemen assembled at the Athenaeum Lecture Room by Dr M. A. Ward of Salem. This address was replete with so full and amusing information. It gave historical sketches of the sciences of Botany and Natural History from the earliest age to the present time, interspersed with interesting anecdotes relative to distinguished men who have successfully cultivated those branches of erudition. It exhibited proofs of the advantages which had been derived from the labors of Horticultural Societies both in Europe and the United States, and adverted to the benefits which the public had received, and which might be expected to accrue from the exertions of those and similar institutions; commended the efforts of the Massachusetts Horticultural Society, and specified some of the favorable results of their labors. This Address we hope will soon be published by the Society.

Among the donations of fruits and flowers, which were presented for the Festival were the following, viz:

Dr Webster; Sweet-water and Isabella Grapes, peaches. Mr H. A. Bredt, of Lynn; Water-melons. Mr Abel Houghton, of Lynn; Citron Musk-melons and Isabella Grapes. Mr Samuel Pond, Cambridgeport; Sweet-water, red Chasselas and Isabella Grapes. Dr O. Fiske, Worcester; a large basket of Peaches, called Chamberlain, resembling the St Michael. Mr Joseph Joy, Boston; brown Beurre Pears. Mr E. Voss, Dorchester; black Hamburg, white Chasselas, and Gros Marie Grapes, Capiaumont Pears, and Morris white Peaches. Dr S. A. Shumlett, Boston; white Chasselas Grapes. St Michael, Seckle, and Broca's Bergamot Pears, and 'Shuttle's' seedling Grapes. Mr D. Hagerston, Charleston; black Hamburg and Sweet-water Grapes. Mrs R. Mackey, Weston; superb clustering Peaches. Mr C. Cowen, Roxbury; Cap. Grapes, Goshom Parsons, Esq. Brighton; Hubbard's Non-such, Pomme rouge fauve, and Washington Pearmain Apples; Broca's Bergamot, and Sylvauche vette d'iver Pears. Mr S. C. Lyford, Meredith, N. H.; St Michael Pears. Mr R. F. Phipps, Charleston; Andrews Pears.

Dr Z. B. Adams, Boston; St Michael Pears and a fine specimen of Hibiscus Manihot. Madam Parkman, Broca's Bergamot Pears. Mr Samuel Downer, Dorchester; black Hamburg, red Chasselas, Isabella, Schuyllkill, Troy, Nazare and Gold Grapes; Capiaumont, Beurre, Knox and Seckle Pears. Mr Enoch Bartlett, Roxbury; Bartlett and Capiaumont Pears. Ribstone Pippins, and Spitzenberg Apples, Isabella Grapes and Water-melons. Mr Wm. Kenrick, Newton; Isabella Grapes. Mr J. Wilson, Boston, Peaches. Mr Daniel Chandler, Lexington; Fruit of Passiflora edulis. Mr R. Tooley, Waltham; Heathcott and Seckle Pears. Messrs Winslip of Brighton; black Hamburg, black Cape, black Muscadine, black Cluster, Royal Muscadine, white Chasselas, white, Sweet-water, Saragossa, Wyatt, Isabella and Schuyllkill Grapes. Madam Dix, Boston; Dix Pears, a fine specimen. Mr Charles Seider, Roxbury; one large Lemon tree, one large and two small Orange trees in fruit.

Mr David Fosdick, Charleston; White Muscadine and Isabella Grapes, Apples, Pears and Peaches. Mr J. Binnstedt, Boston; a basket of small Blue Ischa Figs. Gen. Dearborn, Roxbury; Heath Peaches, Marie Louise, Beurre d'Angleterre, English Bergamot, and a beautiful cluster containing 36 Seckle pears. John Prince, Esq. Jamaica Plain; Beurre du Roi, Fulton, Dr Hunt's Connecticut and Capiaumont Pears; Hubbardston Non-such Apples.—Mr Eben. Breed, Charleston; Black Hamburg Grapes. Mr Charles Lawrence, Salem; Black Hamburg Grapes, 4 clusters weighing 24—18—18—17 ounces.—White Muscat, Reinsine of Charette de Lamoignon, Petit Rausching and Gray Burgundy Grapes; St Michael Pears, and Kennedy's Carolina Clingstone Peaches. Zebedee Cook, Jr. Esq. Dorchester; Black Hamburg, White Muscat, Barcelona, Constantia, Catawba and Isabella Grapes, Seckle Pears, Water-melons, one weighing 28 lbs. and four varieties of musk-melons. Mr Thomas Whitmarsh, Brookline; large Carolina Water-melons.

S. G. Perkins, Esq. Brookline; white Muscat, Muscat of Alexandria, and black Cape Grapes; Belle de Vitry

(superb) Royal George, and Morris' Lucien's white rare-ripe Peaches; a potted branch of white Chasselas Grapes containing wood of the years 1831, and wood which in ordinary culture, would have appeared in 1832, 33, 34, with the fruit of the last three years thereon, that of the present year having been gathered. Hon. Richard Sullivan, Brookline; black Hamburg, Sweet-water and an unknown kind of Grapes. Alderman Hall, of New-York, a basket of large and handsome Pears, name unknown.

The following letter from the Hon. O. FISKE was sent with his donation of *Chamberlain Pears* mentioned above.

Worcester, Sept. 16, 1831.

MY DEAR SIR—I exceedingly regret that an engagement with the governor as a Committee to examine White Mulberry Nurseries for a premium, in various parts of the country (postponed on account of the weather) must deprive me of the pleasure of meeting my Horticultural friends at our Annual Festival. I however avail myself of the occasion to forward for their inspection a basket of native Pears. Although the produce of a farm within two miles of me, I was in ignorance of their existence until yesterday, when I requested the owner to preserve the gleanings of *thirty bushels* which the tree had borne for my use. I was on the ground today and found the tree about 15 inches in diameter near the ground with a moderate decrease for 8 feet, when it struck off into a perpendicular and two lateral branches, giving it a well proportioned and well balanced top. Although it had the appearance of age there was not a scar on the body of a dead or a diseased limb to be seen. I considered it as the best conditioned tree for its age I had ever noticed. On the most careful inspection it had every appearance of a native.

The account I obtained from the present owner was that the farm formerly belonged to a Deacon Chamberlain, one of whose sons found it in a pasture some distance from the house where his cattle had their range, and transplanted it to its present situation.

I called on Gen. Chamberlain a grand-son of the Deacon, who owns an adjoining farm. He corroborated the above statement and added that the tree was removed about sixty years ago, and by his *uncle Jacob* now living and from that circumstance the fruit has always been called the *Jacob Pear*. It is generally a free bearer, and has never been known wholly to fail. As a table fruit from the redundancy of its saccharine quality and distribution of flavor it will doubtless be considered as inferior to many of our varieties of native Pears. But for all domestic uses, which in a family are of primary importance, I doubt whether it can be excelled. It comes in use when fruit of this character is not readily obtained. I was told that it retains its form and size when baked and gives a red and rich pulp. It is moreover longer in eating than most other kinds as may be judged by the sample.

Should the committee think proper to give it a place in their nomenclature, I would suggest the propriety of calling it the *Chamberlain Pear*.

Respectfully your friend and servant, O. FISKE.
ZEBEDEE COOK, JUN. ESQ.

The following letter from S. G. PERKINS, Esq. was sent together with the fruits &c. presented by that gentleman.

Brookline, Sept. 21, 1831.

ZEBEDEE COOK, JR. ESQ.

Chairman of the Committee of Arrangements.

DEAR SIR—I herewith send you a branch of the White Chasselas Vine, containing the wood of the years 1831—1832—1833 and 1834, with the fruits of the three last years attached to their respective shoots—that of the present year having been long since gathered and eaten. You will perceive therefore that this Vine has borne this season, the fruits for four years; which may be considered by some of your guests an object of curiosity, and I apprehend must be new to most of them.—The wood of 1832 has one bunch of grapes only; that of 1833 has two bunches; and that of 1834 has three bunches.—The first is ripe—the second newly so, and the last are as you will see, quite small. There may be uses drawn from this fact which every gardener who is acquainted with the culture of the Grape Vine, will readily see; and as it is the power of every one to produce the same result, they may a certain number of species of grape they are cultivating one, two, or even three years before the vine in its natural course, would produce its fruit.

Respectfully your obedient servant,

SAMUEL G. PERKINS.

At 4 o'clock the Society, with their guests, consisting in all of about two hundred, sat down to a dinner, prepar-

ed by Mr. Eaton, at Concert Hall. This repast was all that could gratify the most keen, as well as please the most fastidious appetite. It was served with a promptitude and precision, an attention to the wants and wishes of every individual, but rarely witnessed in an entertainment, given to so large a party. The Hon. H. A. S. DEARBORN, President of the Society, presided at the table, and was assisted as Toast master by Z. Cook, Jun., Esq., first Vice President of the Society. The entertainment exhibited a feast of intellect and a festival of wit, as well as choice viands for those who were inclined to mingle the repast of the senses with the 'flow of soul.' The following regular toasts were drank.

Our Country—Where each Exotic finds support—where nothing but the willow weeps.

Massachusetts—In peace she furnishes Grapes for her friends—in war, Grape-shot for her enemies.

The Massachusetts Horticultural Society—By introducing new modes and articles of culture, we hope to add new links to the chain of social being.

Political Horticulture—Which has shown experimentally—that the *Flower de luce* does not succeed well in France—nor the *Orange* in Belgium.

The Poles—Principle as well as Patriotism awakens sympathy in their heroic struggle—since it is the duty of every free citizen 'to go to the polls.'

The Russian Grand Duke and the Portuguese Tyrant—We would not exchange a *St. Michael's pear*, for a pair of such Michaels.

La Fayette—an anomaly in Cultivation—A Tree vigorous at 74—whose grafts will survive the parent stock, and perpetuate the original flavor of its fruit.

Our Alma Mater—Constant improvements in this original Nursery, until every scion surpass the best of our Seedlings.

The Two Websteres—One an N-pounder of the American Language, the other a 76-pounder of the American Constitution.

The Industry of New England—The braiding of palm leaves and the spinning of cotton have shown that what we do not produce we render *productive*.

Our Festivals—While we draw from Vineyards in Europe, and from plantations at the Tropics, we have satisfactory proofs of a good Kitchen Garden at home.

Eden—The first abode of the living—Mount Auburn, the last resting place of the dead.—If the tree of life spring from the soil of the one, Immortality shall rise from the dust of the other.

Cultivation, Commerce and Manufactures—They must be co-existent, and we hope in this country they will be co-eternal.

VOLUNTEER TOASTS.

By J. C. GARY, Esq., Third Vice President.—*Our Country*—a noble tree, with 21 fruitful branches—L. it be preserved from splitting at the crotch, and no earthly power can prostrate it.

By DORT, Ward, of Salem.—*The Flora and Pomona of New England*—The man of science may plant, the man of wealth may water, but the man of practical skill must give the increase. Success to them all.

By Rev. J. Pierpont.—The tables turned since man first attended to Horticulture—then he had his worst fall in the Garden—now he has his best Garden in the Fall.

By Mr. ASSUR (a native of Poland).—*The Poles*—In America they are necessary for the cultivation of Hops—in Europe, the Russians are taught by them a quicker step—flight.

By Hon. Nathan Appleton.—*Cultivation*—The only process of obtaining Fruit, whether applied to *Mind* or *Matter*.

By E. Vose, Esq.—*Belgium*—the land of Van Mons; in return for the scions of its fine fruits, we offer to it scions from our own Tree of Liberty.

By E. Bartlett, Esq., Second Vice President.—*Our Country*—May those who administer the Government remember that the Apple of Discord should never be cultivated.

By Hon. Judge Davis.—Our modern Druids, who turn Forests into Fields, unite the Garden with the Grove, and are such decided Utilitarians as to prefer Maize to Mistletoe.

By Samuel Appleton, Esq.—The Garden of Eden, lost to Mankind by the curiosity of Woman—regained for Woman kind by Horticultural Societies.

By T. G. Fessenden.—*The Hon. JOHN LOWELL*, the Patriarch of Improved Husbandry—his influence, pre-

cepts and examples have anchored the Farms and Gardens, and deserve the grateful acknowledgments of every New England Cultivator.

By a Member.—*The Orator of the Day*—He has presented us this day, to use his own language, a nut of the sweetest kernel, and happily easy to crack.

By Dr. Bigelow.—*Bunker Hill Monument*—We regret to find that it resembles in nothing the worthies whom it commemorates, except in having come to an *obstinate stand*.

By Zebedee Cook, Jun., Esq., First Vice President, (after the President had retired).—H. A. S. DEARBORN, the President of the *Massachusetts Horticultural Society*—The scientific and practical Cultivator—the annals of our Institution attest the value of his labors; the gratitude of his co-laborers is cheerfully and liberally accorded him.

By a Member.—GORHAM PARSONS, Esq.—a distinguished patron of the sister Societies, Agriculture and Horticulture.

TRANSMITTED.

By William Prince, Senior Proprietor of the Linnaean Botanic Garden.—*The Hon. John Lowell*—the distinguished patron and benefactor of Horticulture.

By William Robert Prince.—*The Horticulturists of Poland*—May the Tree of Liberty which they have so gloriously planted, overshadow and exterminate all germs of despotism.

By Alfred S. Prince.—*Flora and Pomona*—Ah!e animating the hearts of their votaries in every clime.

Other sensible, witty and sentimental sayings were uttered and responded, which we are compelled to omit.

Several songs were sung, and among others one original, written by the Editor of the *New England Farmer*, (and printed on the last page of this day's paper,) was sung with much skill and effect, by Mr. J. W. NEWELL, of Charlestown.

LILLY & WAIT, Boylston Square, have just republished the 96th number of the Quarterly Review; it contains valuable articles on the following subjects:—Commexion of Intellectual Operations with Organic Action—Dunn's Poems—Modern Science; Inductive Philosophy—Doctrine of Saint Simon; New Distribution of Property—Subversion of Ancient Government—Old English Domestic Architecture—Friendly Advice to the Lords—Sanskrit Poetry.

ALBANY HORTICULTURAL SOCIETY.

The third anniversary of the Albany Horticultural Society was celebrated in this city on Saturday. The display of fruits, vegetables, plants and flowers, was not as great as on the previous anniversary, the season being unfavorable to the peach, pear, grape and particularly to what may be called our staple fruit, the plum; but it was, on the whole, a creditable exhibition. The annual address was delivered at the Mansion House, at 3 o'clock, P. M. by the Rev. Dr. LACEY. It was a highly pertinent and valuable effort, and was well received by the audience. We hope the author will consent to its publication, with a more extended account of the proceedings. At 4, P. M. the company sat down to an elegant dinner, served up in the best style, by Mr. Bradstreet. The guests consisted of the members of the society, the Lieutenant Governor, Chancellor, Comptroller, Secretary of State, Recorder of the city, and other state and city officers, and many citizens. Among the invited guests were the venerable Col. Bassett and Dr. Everett of Virginia, Maj. Talcott of the U. S. Army, and Dr. Spafford, Mr. Walsh, and other efficient members of the Rensselaer County Horticultural Society. Judge BUEL, president of the society, presided, assisted by ISAAC DENNISON, Esq. vice-president. The room and table were suitably decorated. After the cloth was removed, various toasts were drank. The company separated at an early hour, in all respects, we believe, highly gratified.—*Albany Argus*.

Wanted,

An able bodied laborer, who has had experience in the management of hot beds, and forcing early vegetables for market. Apply at his office. Sept. 28.

Linnaean Botanic Garden and Nurseries.—Flushing, near New York.

WILLIAM PRINCE & SONS, Proprietors, announce that the great extensive range in their establishment, which now covers near 50 acres, compactly and regularly filled with Trees, Shrubs and Plants of the choicest kinds, enables them to offer the various sorts at the reduced prices stated in their *New Catalogue*, which will be sent to any person who may apply for them.—The quality and excellence of the trees are superior to all former periods, and the most scrupulous attention has been devoted to their accuracy, which is invariably an object of their personal attention. To Nurseries they will allow a liberal discount and a convenient credit.—All letters desiring information will be replied to by the first mail.

As many persons are agents for different Nurseries, it is requested that orders intended for us be particularly specified. Every Invoice sent has a printed heading and our signature, and such proof of origin must be insisted on, as we take upon ourselves no responsibility unless such an invoice can be produced. We are thus particular for conclusive reasons, knowing we have been injured by impositions.

In the next paper some particular articles will be enumerated, highly interesting to the public, of which they have cultivated a large supply to meet the great demand. Orders can be sent direct to the proprietors, or to J. B. RUSSELL, Agriculturist, Boston.

N. B. In the Pomological Manual, just published, above 220 varieties of Pears, 100 of Plums, and 100 of Peaches, are fully described, besides other fruits, that do not so conversant with the subject can make their selections from a knowledge of the qualities. Sept. 21.

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street.

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed. Aug. 3.

Cocoons Wanted.

The Subscriber will pay cash for Cocoons, from 25 to 50 cents, according to quality. J. H. COBB.
Dedham, July 15th, 1831. St. July 20.

The Moral Class Book,

Or the Law of Morals; derived from the Created Universe, and from Revealed Religion.—Intended for Schools. By William Sullivan, Counsellor at law.

'The statutes of the Lord, are right; rejoicing the heart. The commandment of the Lord is pure; enlightening the eyes.' Psalm xix, 8.

Extract from the Preface.

'The plan of this volume is to search out the original principles of morality. They are supposed to have been found in the laws of the created universe. We have endeavored to prove, that this universe must have proceeded from Supreme Intelligence, Almighty power, and unbounded goodness; that it is one connected, and dependent system of being; that physical, intellectual, moral and religious man, is necessarily a part of it; that his relation to the universe, can be discerned and understood by the light of reason; that what he thus learns, is confirmed, and sanctioned, by Divine revelation. Beyond this we do not go: and beyond this we need not go, since it is thus disclosed, and made certain, that the law of morals, is the will of God.

'It may be supposed, that such an inquiry would necessarily lead to peculiar, and even to sectarian opinions in religion. This consequence does not follow. If it did there is no call to introduce it into this volume; nor is it introduced. We know, and respect the differences which exist, in religious opinions, in this free land. With these on this occasion, we have no concern. The sole purpose is to illustrate the principles of that morality, which all denominations of Christians respect.'

'The above works should be in every family, and in every school. Published by RICHARDSON, LORR & HOLBROOK, School Book publishers, Boston, and for sale by all booksellers in New England.

The Political Class Book,

Intended to instruct the higher classes in Schools in the origin, nature and use of Political Power. By WILLIAM SULLIVAN, Counsellor at Law. With an appendix upon studies for practical men, with notices of Books suited to their use. By GEORGE B. EMERSON.

The object of this work is to point out to the youths, who are in the course of education, their relation to each other, to society and to their country; and to show, in a plain and simple way, the excellence and value beyond all price, of the political condition in which they exist. The further purpose is to give some information of the social system of which they are to become active members, and on which their own happiness, in common with that of all around them, absolutely depends. The plan is—First, to sketch the principles on which society is formed. Secondly, to show the fitness of the State Government to accomplish the intended object of it. Thirdly, to do the like as to the National Government. Fourthly, to notice some subjects which concern those who are approaching manhood, and those who have risen to be citizens.

The Appendix contains a short account of the most approved books in arts, sciences, literature, history and morals, with introductory remarks.

Woodbridge and Willard's Universal Geography.

This day is published, the fourth edition of Woodbridge and Willard's Universal Geography, Ancient and Modern, adapted to the present state of the world. For the use of the higher Classes in schools and Academies, and for private Libraries. Accompanied by both Modern and Ancient Atlases. Modern Geography, by WILLIAM C. WOODBRIDGE, Editor of the 'Annals of Education,' Author of 'Rudiments of Geography for Schools.'

Ancient Geography, by EMMA WILLARD, Principal of the Troy Female Seminary.

The present (fourth) edition has been improved by the addition of such recent information of changes, improvements, and discoveries, as have been deemed important. A new folio Map of England, Scotland and Ireland; a Map of the Pacific Ocean, a Chart of the principal Animals of the world, a Geological Map of Europe, and a view of the principal Sections of Canals in the United States, with several new engravings of Public Buildings, Cities, &c. have been added. The Maps of the four quarters of the Globe are from new and improved drawings, and it is believed will be found to possess peculiar advantages. The plan of this work, as also of the School Geography by the same authors, (which is claimed to be original), it is well known, has obtained the decided approbation of the most eminent Geographers and Teachers in Europe as well as in our own country. The following opinion of this work from the Rev. JOSEPH H. HARRIS, late of Cambridge University, England, President of Kings College, York, U. C. has been recently received by the Publishers.

'Allow me to return you my best thanks for the copy of your Universal Geography, and its accompanying Atlas—and if I may offer an opinion on their merits, I would characterise them as the most comprehensive, and best methodised, and therefore the most useful work, connected with the subject of Geography, that I have met with; not only admirably adapted to the purposes of instruction, but containing much to render them valuable as a reference at all times.'

For sale by the principal Booksellers in the United States.—In this city by CARTER, HENDEE & BARCOCK and CROCKER & BREWSTER.

It is in press the fourteenth Edition of 'Woodbridge's Rudiments of Geography and Atlas' for Schools, with new and improved drawings of the Maps for the Atlas and other important additions.

September, 1831

Wants a Situation,

A Gardener—a steady, active man, who is perfectly acquainted with every department of the business, and will be highly recommended by some of the most respectable families in the vicinity of Boston, having no family but a wife; he will engage as a single man or otherwise. Any commands directed to F. L. care of James Ryan, No. 6, Battery-march street, Boston, will be respectfully attended to. Sept. 21.

Ammunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 61 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. (1 Jan.

BRIGHTON MARKET—Monday, Sept. 26.

[Reported for the Chronicle and Patriot.]

At Market this day 741 Beef Cattle, 714 Steers, 1267 Sheep, and 1617 Swine. 50 Swine and a few Store Cattle were reported last week. Several hundred Stores and thin Cattle remain unsold, many of which will probably be sold tomorrow.

Prices.—Beef Cattle—A little depreciation from last week, probably occasioned by the weather. We quote for prime 4 75 a \$5; good 4 25 a 4 50; thin 3 25 a 4.

Stores—Sales not very brisk; no prices ascertained. Working Oxen—We noticed a few sales at \$45, \$53, 62, 70 and 75.

Cows and Calves—Sales at \$20, 21, 23 and 25. Sheep—Sales quick, occasioned by the limited number, and higher prices were obtained. Sales of lots at \$1 75, 2, 2 25, 2 33 and 2 37 1/2. Some Wethers at \$2 50 a 2 75.

Swine—We noticed a lot of prime large Barrows, at 4 1/2; several small selected lots, two thirds Barrows, at 4 1/2; one of 150, not selected, probably two thirds Barrows, at 4 1/2. Retail price for Sows 4 1/2 a 5; Barrows 4 a 6.

New York Cattle Market, Sept. 23.—Market for Beef Cattle this week rather brisk, and better supplied; 900 head in, and principally sold at \$4 50 a 6 50, and a few very fine at \$7. In Sheep and Lambs, no variation in quality, price or demand; 2000 head in, and all sold quick; Sheep \$2 50 a 6; Lambs \$2 a 3. Fat Hogs scarce and sell quick at \$4 50; what few Store Hogs have been in, sold at \$4; more wanted. Cows and Calves no sales this week; Calves very scarce and in demand.—Daily Advertiser.

MISCELLANY.

The Feast of Fruits and Flowers.

A SONG.

Written by T. G. FESSENDEN, and sung by JOSEPH W. NEWELL,
at the Massachusetts Horticultural Festival, September 21, 1831.

Come! Cultivators, leave awhile
Your Gardens, Fields and Bowers,
And join with us to celebrate
Our Feast of Fruits and Flowers:
With blameless luxury enjoy
Rich products of the soil,
Rewards which crown the Art of Arts,
When skill enlightens toil.

What though within our temperate zone,
No burning sun sublimed
The Fruits the Destinies bestow
On pestilential climes;
All health and happiness require,
All man should ask of heaven
To satiate innocent desire
Is in profusion given.

The worst privations we endure
Prove blessings in th' event,
And should our gratitude excite
Instead of discontent;
For ills which task our highest powers
To conquer or evade
But bid the human race aspire
To reach its highest grade.

No imps of sloth lie fushing here,
Like serpents in the sun,
Even mountain streams to turn machines
Must labor as they run;
Within New England's granite bounds
No useless beings lurk,
The rough and raging elements
We yoke and set to work.

When sentimental zephyrs blow
For love and rhyming fit,
Our windmills make them work like dogs
Compell'd to turn the spit;
Niagara's thundering cataract
Our power shall hamper till
It toils like Dutchmen in a ditch
Or Sam on his mill.

Since fire and water harness'd here,
Compose a Yankee team,
Perhaps our General Government
Might go as well by steam;
But as this case were better brought
Before some higher court,
'Tis left for Congress, when they meet
To argue and report.

The Line nor Olive will not grow
Spontaneous here—what then?
We've hearts of oak and nerves of steel
In noble crops of men;
Our plant call'd FEMALE EXCELLENCE
No hot bed culture needs
To yield sublimar Scirpium
Of pure celestial breeds.

When winter dissipates the heat,
Beneath an iron sky,
Hot-houses with hot water fraught
Caloric will supply;
Thus gardeners by and by will make
Fine climates of their own,
And raise by manufactured heat
The plants of every zone:—

With Lime and Sulphur doctor off
Vile insects by the host,

Till art at length of Nature's plagues
Completely clears the coast.
Thus every blessing may be ours
Which Providence has given
To every land and clime beneath
The canopy of Heaven.

FAMILY SCENES—IS IT NOT SO?

Romping Sally runs against the corner of the table, raises a bump on her head, and of course begins to cry lustily. The mother comes to her assistance.

'Did it hurt its pretty head? What was it hurt my Sally?'

The sobbing child points to the table.
'Was it the table? naughty table! beat it well.' [Slap! slap! on the offending table.] 'That will teach it to hurt my Sally another time.—Beat the naughty table again. It shan't hurt my Sally.'

In the meantime Sally's confusion has become less painful, the red eyes are dried, and the child is pacified—at the expense of a practical lesson in *revenge*. Miss Sally, fifteen years afterwards, throws the blame of every mischance or misfortune which her own clumsiness or folly has caused, upon her companions and dependants, simply because she must still have a table to beat.

The mother's pet, Tommy, has been playing all the morning with his new toys, has broken up his drum to see what was inside of it, and tossed his penny trumpet and windmill into a corner; and now he comes crying to his parent, tired of his play and play-things, and expects her to spend her time in inventing new amusements for him.

'No, I'm busy. The clothes have just come in from the washing, and I must put them away. I can't play with you today, Tommy, indeed I can't.' But Tommy knows better. He has been told fifty times before that his mother was busy and could not attend to him; and he remembered well, that a little teasing gained him the victory. Like a good general, he tries the same manoeuvre again.

'Come and play with me, Ma! I don't know what to do. I can't play alone, and Dick won't be home from school till two o'clock.' A fresh denial provokes a second fit of crying, and Tommy's perseverance triumphs. His mother plays at hare and bound with him, tells him ghost stories, makes a cat's cradle for him, and mends his drum, till the clock strikes two. The father comes home, sees no dinner ready, looks for his wife and finds her at the rapery press. 'My dear, how is everything so late today?' 'Oh, that teasing Tommy would have me to play with him this whole hvelyong morning; and I have not been able to do anything since breakfast.'

Thus a petted child's whims are allowed to derange the economy of a whole family; and the good mother never dreams that she is bringing up her favorite to be a selfish, self-important being; a burden to himself, and a plague to society.

Even the odious vice of lying is most unconsciously, but most effectually inculcated by the weakness and inconsistency of parents.

'Frank, you shall not go outside the garden wall again to play with these dirty boys in the street. I have told you fifty times I would not have it; and I won't. If you ever go again without my leave, I'll never speak to you afterwards. I'll sell you to the gipseys, and they may do what they like with you.'

They say man would leap over the wall of a paradise, even though it were surrounded by a desert, to escape confinement. At any rate, Frank does not choose to be cooped up; so he leaps the garden wall the next day, and is the merriest and noisiest amongst his rough companions. His mother finds him. Does she censure all intercourse with her own child, as she promised; does she sell him to the gipseys, as she said she would?

Yet she expects him, when he grows up, to consider his word, once given, sacred and inviolable. If she detects him in a lie, she wonders how on earth he learned such wickedness; and were you to suggest that her own example, (at all times more powerful with children than precept) was the cause, it would be considered an insult never to be forgiven. No wonder that a man's word goes, for so little in this world, and that we must have oaths and pledges upon all occasions.—*Free Inquirer*.

Auction.

Farm, Stock, Utensils &c. To be sold at public auction on Tuesday, Oct. 1th, at 11 o'clock A. M. on the premises the well known Farm, situated in West Newbury, called the Carr Farm, containing about fiftyfive acres of most excellent land, with a good two story house and out buildings, well fenced and watered; it is about one mile from the church in the 1st parish, and about the same distance from Indian Hill Farm, on the road leading from West Newbury to Byfield, Rowley, Salem, &c.—and five miles from Newburyport. On the highest part of the land the view of the Merrimack River and the landscape view in every direction is very beautiful. West Newbury as a town has increased remarkably within the last ten years. Taxes are low, (it being an inland town) and the society very good, as almost every residence is owned by the occupant. Title indisputable. Half the purchase money may remain on mortgage at 6 per cent if desired.

Also, immediately after the sale of the Farm, a valuable stock of Oxen, Cows, Heifers, Swine, Brood Mares and their Colts, 1 pair Horses well matched in color, &c. 1 pair Colts three years old next spring. Also, 1 superior new ox cart, with 4 tent hubs, &c.

A great variety of other articles, catalogues of which can be obtained two weeks before the sale, at the printing offices of those newspapers that publish this advertisement, and also of Mr. Cary, at the market house, Newburyport, and the Auctioneer.

'§7' Conditions (which will be liberal) made known at the sale.

Sept. 9. JOHN E. BARTLETT, Auctioneer.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer's office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

'§7' No paper will be sent to a distance without payment being made in advance.

COMMUNICATIONS.

THE NEW ENGLAND SYLVA.

The rapid career in which the Republic of the United States has attained its present elevated rank in the scale of nations, is unparalleled, and its accelerated and continued advancement excites a deep interest in the various parts of the civilized world. But there is nothing which seems more fatally to threaten a weakening, if not an entire dissolution of the strength of this nation, than the sensible decay of its wooden walls, when, either by time, negligence or fortuitous causes, our present navy shall be worn out or impaired. It is less surprising, therefore, that the impolitic dissolution of our timber or forest trees has been suffered; but a disproportionate spreading of tillage, has caused the prodigious havoc, made upon all those goodly woods and forests, which our prudent ancestors left standing for the ornament and benefit of their country. And this devastation is now become so universal, to supply furnaces, glass houses, factories, &c. with fuel, that a less than an auspicious expedient offer itself, and means be seriously and speedily resolved upon, for a future store, one of the most glorious and considerable bulwarks of this nation will, within a few centuries, be totally extinct.

From the impolitic waste and universal sloth among us, we should be reminded, that such woods as do yet remain entire, might be carefully preserved, and such as are destroyed, scrupulously repaired. It is what all, who are owners of land, can participate in. There is no part of husbandry which men more commonly fail in, neglect, and have cause to repent of, than that they did not seasonably begin to plant trees, without which, they can neither expect fruit, ornament or delight from their labors. Men seldom plant trees till they begin to be wise, that is, till they grow old, and find by experience the prudence and necessity of it. When Ulysses, after a ten years' absence, was returned from Troy, and found his aged father in the field planting trees, he asked him, 'Why, being now so far advanced in years, he would put himself to the fatigue and labor of planting that, of which he was never likely to enjoy the fruits?' The good old man, taking him for a stranger, gently replied—'I plant against my son Ulysses come home.' The application is obvious, and is instructive both to old and young.

Independent of ornamenting the earth and of furnishing us with timber and fuel, forests arrest the progress of impetuous and dangerous winds; maintain the temperature of the air; diminish extreme cold, and regulate intense heat; oppose the formation of ice, and shelter the earth from the scorching rays of the sun; produce an abundance of water in the streams, and oppose a barrier to washing away or undermining their banks; preserve and enrich the soil on hills and mountains; discharge the electricity of the atmosphere and serve as laboratories for purifying the air we breathe.

The trees of our country recall the idea of it in the most forcible manner, wherever we meet them; and are often the first objects that attract the attention of those who have been long absent from their native land, and who, on their return, pour out

their genuine effusions of joy on beholding them. We are aware that many an American has sighed under the shade of the banana for a sight at the village elm, the well known oak, or the unchanged pine of New England. We are told of a young Indian, Pontaveri from Otaheite, who, amidst the splendor of Paris, regretting the simple beauty of his native island, sprang forward at the unexpected sight of a banana tree in the Garden of Plants, embraced it, while his eyes were bathed in tears, and exclaiming with a voice of rapture—'Ah! tree of my native country!' seemed by a delightful illusion of sensibility, to imagine himself, for a moment, transported to the land which gave him birth.

It seems hardly possible for any mind to be so debased as to be insensible of the effects of Nature, whose vegetable charms become more endeared to us as our age and reflection increase. A more delightful cabinet of Natural History can scarcely be found, than the forest or plantation affords. It offers matter for contemplation of the most agreeable kind, which varies still as seasons revolve; and as every tree and shrub has its peculiar inhabitants, we have at the same time a collection of animal and vegetable wonders, sufficient to occupy all the leisure which our economical duties allow us. Every tree we plant adds to the entertainment, and we prepare for future years, for ourselves, our friends, our country and our successors.

From the foregoing considerations, the undersigned has commenced preparing a work, to be entitled the New England Sylva; to contain the history and description of all the important species of forest trees growing in New England; to treat of their uses and application to the arts, and the mode of culture and propagation; illustrated by plates.

It will be his object to attract attention to the peculiarities of each tree by noticing the allegorical allusions and anecdotes of the ancients, the harmony of the poets, the observations of the physicians, and the reflections of the moralists of all ages. Morality, however, of a gloomy cast, will be avoided; for his wish is to give the work, like the subject, a smiling aspect.

The practical part of his undertaking will embrace the most approved modes of culture and propagation, with directions for laying out plantations, and such other remarks on their utility and economy, as directly concern the great mass of the community. In regard to the form and size of the work it is indefinitely determined. It will make its appearance as soon as can be found practicable.

D. J. BROWNE.

Boston, Sept. 1831.

GREEN CORN STALKS.

South Boston, Sept. 29, 1831.

MR FESSENDEN—I have been accustomed from my childhood to the use of green corn stalks, as a food for milch cows; and shall probably continue the use of them myself, so long as I keep cows and raise corn; because I am confident I can give them no kind of green food so good, either for their milk, or their flesh, unless it be green corn in the milk. This season, the feed in my pasture had got rather short, and the milk somewhat diminished, before I commenced feeding my cows

with stalks. Till the last week, they have been fed with them ever since they were fit to cut, say about six or eight weeks, to the manifest advantage of their milk. It did not diminish till the latter part of the time, when the stalks had nearly perished. In the course of the time, I have repeatedly had occasion to remark how well their milk held out. And yesterday, upon inspection, I was led to remark, that they had also perceptibly gained flesh in the time. They are now in after feed 'up to their eyes,' with an increase of milk again; but not so great, as when they fed upon the green succulent stalks. I cannot be mistaken in this statement, as the morning's milk has been regularly measured and sold; though I have not been induced to ascertain the exact increase and diminution, upon exchange of feed. Even now the cows will leave their grass, to nibble among the naked remains of the cornfield; so very fond are our neat cattle of every part of this invaluable vegetable, the root only excepted, while the sweet sap remains in it.

For this reason, when we begin to feed cows with stalks, we must feed them to the full. They will then lie quietly down, and *ruminate upon the subject*. And if they get but little water, their milk will not suffer much in quantity or quality. When they once get the taste of stalks, they must be satisfied or they will stand all day impatiently watching the cornfield, if they do not break into it; and setting up a clamorous bellowing, at the sight of every human being. *Duke*, compelled by pressing hunger, they will not abide with us the labor of getting their living. They will neither eat grass nor drink water, so long as they expect anything they like better. My rule is to give them as many stalks as they will eat up clean. This may be ascertained in a few days by careful observation. They should be fed regularly morning and afternoon. And a cow of common size will eat a good *armful* a day. They will refuse the leaves and the tassels, or blossom, after they have become dead dry. But on the ground where seven cows and much of the time, a yoke of oxen have been fed through the stalk season, I can hardly find a bit of stalk six inches long; although an unusual proportion were barren stalks, of large size, and cut close to the ground. I am more and more confirmed every year, in the belief, that it is far more profitable to feed stalks green, out of the field, than to cure and house them. If well cured I know they make excellent fodder. And in bundles, they are very convenient to bait oxen with away from home. But it requires much labor to secure them in good order. They are very susceptible of injury from bad weather. And unless compelled by hunger cattle will eat only the leaves, and the slender part of the dry stalk.

I ought to apologize for the unintended length of this article, which I should not have written, but from a deep conviction that the communication of your correspondent from Newton was calculated to mislead in what I consider a very important item of rural economy. In a scarcity of grass feed, green stalks are of great value. They come in the most critical part of the grass season. They are very easily and cheaply raised, by large quantities, in drills for green fodder or dry, after an early drought,

and a short crop of hay. And I am confident your correspondent will never again doubt the utility of the practice, if in future he will feed his milch cows to the full with stalks, and not leave them to depend for much of their subsistence, in the time upon grass-feed, however good.

Yours, with much respect, **LEMUEL CAPEX.**

Horticulture.

Proceedings of the Massachusetts Horticultural Society, at a meeting held at the Hall of the Institution, on Saturday, Oct. 1st, 1831.

The following officers were elected for the ensuing year:—

PRÉSIDENT.

HENRY A. S. DEARBORN, Roxbury.

VICE PRÉSIDENTS.

ZEBEDEE COOK, Jr., Dorchester.

JOHN C. GRAY, Boston.

ENOCH BARTLETT, Roxbury.

ELIAS PHINNEY, Lexington.

TREASURER.

CHEEVER NEWHALL, Boston.

CORRESPONDING SECRETARY.

JACOB BIGELOW, M. D., Boston.

RECORDING SECRETARY.

ROBERT L. EMMONS, Boston.

COUNSELLORS.

Augustus Aspinwall, Brooklyn—Thomas Brewer, Roxbury—Henry A. Bredt, Lynn—Benj. W. Crowninshield, Salem—J. G. Cogswell, Northampton—Nathaniel Davenport, Milton—L. Hersey Derby, Salem—Samuel Downer, Dorchester—Oliver Fiske, Worcester—B. V. French, Boston—J. M. Gourgas, Weston—T. W. Harris, M. D., Cambridge—Samuel Jaques, Jr., Charlestown—Jos. G. Joy, Boston—William Kenrick, Newton—John Lemist, Roxbury—S. A. Shurtleff, Boston—V. B. Richards, Dedham—Benjamin Rodman, New Bedford—John B. Russell, Boston—Charles Senior, Roxbury—William H. Sumner, Dorchester—Charles Tappan, Boston—Jacob Tidd, Roxbury—M. A. Ward, M. D., Salem—Jona. Winship, Brighton—William Worthington, Dorchester—Elijah Vose, Dorchester—Aaron D. Williams, Roxbury—J. W. Webster, Cambridge—George W. Pratt, E. W. Payne, Boston—Geo. W. Brimmer, Boston.

PROFESSOR OF BOTANY AND VEGETABLE PHYSIOLOGY.

MALTHEUS A. WARD, M. D.

PROFESSOR OF ENTOMOLOGY.

T. W. HARRIS, M. D.

PROFESSOR OF HORTICULTURAL CHEMISTRY.

J. W. WEBSTER, M. D.

STANDING COMMITTEES.

On Fruit Trees, Fruits, &c.—E. Vose, Chairman, Robert Manning, Samuel Downer, Oliver Fiske, Charles Senior, Wm. Kenrick, E. M. Richards, B. V. French, S. A. Shurtleff.

On the Culture and Products of the Kitchen Garden.—Daniel Chandler, Chairman—Jacob Tidd, Aaron D. Williams, John B. Russell, Nath. Scaver, Leonard Stone.

On Ornamental Trees, Shrubs, Flowers and Green Houses.—Robert L. Emons, Chairman—Jonathan Winship, Joseph G. Joy, David Haggerton, Geo. W. Pratt.

On the Library.—H. A. S. Dearborn, Chairman—John C. Gray, Jacob Bigelow, T. W. Harris, E. H. Derby, Z. Cook, Jr.

On the Synonymes of Fruits.—John Lowell, Chairman—Robert Manning, Samuel Downer.

On the Garden and Cemetery.—Hon. Judge Story, Chairman—H. A. S. Dearborn, Jacob Bigelow M. D., G. W. Brimmer, George Bond, Edward Everett, Z. Cook, Jr. B. A. Gould, G. W. Pratt.

Executive Committee of the Council.—Z. Cook, Jr. Chairman—G. W. Pratt, Cheever Newhall, Charles Tappan, Joseph P. Bradlee.

George W. Brimmer and E. Vose, resigned as members of the Executive Committee.

The President read the following Report of the Cemetery and Garden Committee which was accepted.

The committee on laying out the grounds and forming a plan of the experimental Garden and Cemetery of Mount Auburn, respectfully

REPORT.

That measures were promptly taken for accomplishing those objects, and although considerable progress has been made, it will require further time to complete the work.

Alexander Wadsworth, Esq., a skilful civil engineer was employed to make an accurate topographical survey, and to locate the numerous avenues, which it was found necessary to establish, through the extensive and beautifully diversified grounds of the Cemetery and Garden, both for convenience and embellishment. The map has been so far perfected, that it is submitted for inspection, and to exhibit the general outlines of the projected improvements; but considerable labor is yet required in clearing out the principal carriage avenues and foot paths, before the sites of the public and private cemetery squares can be definitely established, and designated on the plan.

Models and drawings of the Egyptian Gateways, and of a Gothic tower, and a Grecian tower, one of which is proposed to be erected on the highest hill, have been made, and are offered for examination.

It has been ascertained that the most lofty eminence is one hundred and twenty-five feet above Charles river, which gracefully sweeps round its gently sloping base; and when crowned by the proposed tower will become a most interesting place of resort, as commanding an extensive panoramic view, of that richly variegated region of magnificent scenery, embraced within the far distant heights which encircle the metropolis, and the waves of the ocean, while it will present a prominent and imposing feature in the landscape, of which it becomes the centre.

At some future period, when the munificence of the citizens shall be commensurate with their debt of patriotic gratitude, this structure may perhaps give place for a stupendous monument, to the most illustrious benefactor of his country;—there will be reared the cenotaph of Washington, in massive blocks of granite or ever-during marble, should the funds hereafter justify it, a Doric Temple, to be used as a chapel, for the performance of funeral rites, and lodges for the gardener and superintendent of the Cemetery, are contemplated, and designs are in progress for each.

As the season for rural labor is far advanced, it is not considered expedient to commence the construction of the avenues, before the next spring; but they can be divested of the underwood, and the whole of the grounds so far cleared up, as to give them the appearance of a park, during the present autumn. It is expected that the lots may be assigned within twenty days.

The committee has been cheered in the discharge of its duties, by the deep interest which has been manifested for the success of an undertaking, so important to the prosperity of the Horticultural Society and so honorable to the country. Such is the exalted estimation in which

it is held by the public,—so universal is the approbation,—so intense the interest, that, beside the constant requests for permission to become subscribers, by the more affluent, numerous applications have been made for cemetery lots, by farmers, mechanics and dealers in building materials, on condition, that they may be paid for in labor, or such articles as shall be required in the prosecution of the proposed improvements. Within a few days offers have been made to a considerable amount; and as it was the intention and is the anxious desire of the Society, that every citizen should have an opportunity of participating in the advantages of the establishment, the committee has availed of the services thus tendered in executing much of the work which has been performed, and there is not a doubt, that a very considerable portion of the expense in constructing roads, fences, gateways and the various other edifices, may be defrayed, by a compensation in cemetery lots; this will not only be a great accommodation to numerous individuals, who are desirous to become subscribers but be highly advantageous to the Society; it is therefore recommended that the committee be authorized, to prosecute such improvements, as may be deemed necessary, on these reciprocally beneficial terms.

With the view of fully meeting the expectations and exigencies of the community, it is considered advisable that sites for single graves should be designated, in various parts of the cemetery, embracing all the diversified localities, to afford an opportunity for individuals, who have no families, and the friends of such strangers as may be wept and honored far distant from their native land, to procure eligible places of sepulchre, on reasonable terms.

As the tract which has been solemnly consecrated, by religious ceremonies, as a burial place forever, is so abundantly covered with forest trees many of which are more than sixty years old, it only requires the avenues to be formed, the borders for some ten feet in width, planted with shrubs, bulbous and perennial flowers, the underwood cleared out, the fences, gateways and appropriate edifices erected, to put the grounds in a sufficiently complete state for the uses designed, and to render them at once beautiful and interesting. All this can be done within two years, at a comparatively small expense, and a result produced which could not have been realized for forty years, if it had been necessary to have commenced the establishment, by planting out forest trees. There are numerous majestic oaks, pines, beeches and walnuts, which have braved the storms of a century. Towering aloft amidst the general verdure, and extending their huge branches far and wide, they appear as the venerable monarchs of the grove, but still exhibit the vigor of their luxuriant progeny, which, in unobtrusive contiguity, cover each hill and plain and sloping vale, and form many an

—alleg green,
Dingle, or bushy dell, in this wild wood,
And many a bosky bottom, from side to side.

The Garden also, can be very considerably advanced, within the same short period which will suffice for developing the improvements of the Cemetery. The nurseries may be established, the departments for culinary vegetables, fruit, and ornamental trees, shrubs and flowers, laid out and planted, a green house built, hot beds formed, the small ponds and morasses converted into picturesque sheets of water, and then margins diversified by clumps and belts of our most splendid native flow-

cring trees, and shrubs, requiring a soil thus constituted for their successful cultivation, while their surface may be spangled with the brilliant blossoms of the Nymphaea, and the other beautiful tribes of aquatic plants. The excavations for deepening and enlarging the ponds and morasses will afford inexhaustible sources of manure, of invaluable consequence to the Garden, as well as for those portions of the Cemetery which will be embellished by cultivated plants.

From these favorable circumstances and the generous zeal which has been evinced for the energetic prosecution of the labors, which are required to perfect the details of the whole extensive plan, there no longer remains the least doubt, that in the summer of 1834 Mount Auburn will rival the most celebrated rural burial grounds of Europe, and present a garden in such a state of forwardness as will be highly gratifying to the Society, and the public. The work has been commenced on an ever during foundation, has the approbation, and patronage, of an enterprising, intelligent and prosperous community, and cannot fail of progressing in a manner, that must give universal satisfaction. There has Horticulture established her temple,—there will all denominations of Christians surrender up their prejudices,—there will repose the ashes of the humble, and exalted, in the silent and sacred Garden of the Dead, until summoned to those of eternal life, in realms beyond the skies.

Respectfully submitted by

H. A. S. DEARBORN,
For the Committee.

Horticultural Hall }
Sept. 30th, 1831. }

Resolved, That the Committee on the Garden and Cemetery be instructed to appropriate such funds as may be realized from the sale of lots in the Cemetery for the erection of such buildings as they may see proper.

On motion of Z. Cook, Jr.,

Resolved, That the thanks of the Massachusetts Horticultural Society be presented to Dr M. A. Ward, for his highly interesting and acceptable discourse delivered on the occasion of the annual celebration on Wednesday the 21st ult. and that he be requested to furnish a copy of the same for publication.

Samuel Kidder of Charlestown—Horatio Carter of Lancaster—Ward Pool of Danvers—Samuel Adams of Milton, were admitted members. Adj.

FRUITS EXHIBITED.

Apples.—By Mr R. Manning from the garden of Mr John Gardner, Salem, a small red variety, in perfect preservation of the growth of 1830, and from the orchard of Mr Elisha Odlin, Salem, an apple, one half russet, the other half green; it grew upon a Roxbury Russet near to a R. I. Greening. By Mr Samuel Abbot, Charlestown, Baldwin, large size. By Doct. Robbins, Roxbury, Golden Russet, Roxbury Russet, Baldwin, and some of the last gathering of the small handsome red called the Robbins apple. By Gen. Dearborn, Roxbury Russet, very large. By Mr John Clapp, S. Reading, York Russet, Baldwin and Greening. By Mr David Stone, Watertown, a specimen of apples partaking of two varieties, the Baldwin and the Russet. Mr Stone thinks that he obtained them by a division of the scions and uniting the different kinds; however this may be the apples bore evident marks of distinct sorts; they are called Stone's Baldwin Russets. By Messrs Winslips, a variety received from Mr —, a part of which were entirely sweet, others sweet in one distinct part of the apple, some in the other.

Pears.—By Hon. Mr Lowell, a ripe specimen of the Tillington; a rich, melting and finely flavored fruit, and the first of the kind we have seen; we believe it may be said that this as well as all the other varieties received by that gentleman from Mr Knight, as far as mature specimens have been exhibited, have realized the high expectations entertained of them when the scions were received. A note from Mr Lowell is annexed. By Hon. H. A. S. Dearborn, Napoleon, not in eating, Marie Louise, melting and fine, Passe Colmar, not quite at maturity. Seckle, of large size, and a variety called English Bergamot. By Z. Cook, Jr., Esp. Jehonnot, Moor Fowl's Egg, Rushmore's Good Christian, and three varieties not mature. By Mr E. Bartlett, Marie Louise. By Mr E. Breed, Charlestown, a large and uncommonly beautiful specimen of Seckle, and a variety from an imported French tree unknown. By Mr Cheever Newhall, Marie Louise. By Mr Charles W. Greene, Roxbury, very fine pears from an imported tree, without a name. By Mr R. Manning, Beurre Knox, Swan's Egg of Cox, and Napoleon, the last very melting and fine. By Doct. Fiske, Worcester, Seckle, large size, the Van Mons' received by him from France, and a very fine specimen of the Brown Beurre, which last Doct. F. considers evidence of the renovation of that variety, but although that as well as the St Michael are still successfully cultivated at Worcester, we believe that in the vicinity of Boston, their day is past. By Mr William Stearns, Salem, a basket of handsome Chantanelle. By Mr John Clapp, Chantanelle, Bickwell, and two other varieties. By Mr S. Downer, Beurre Knox, Beurre du Roi, Urbaniste, true but not in eating, a beautiful specimen of Capiaumont; some prejudice has existed the present season against the last variety in consequence of its being tasted before ripe, it should not be eaten until the flesh yields to a very slight pressure of the thumb, when it will be found very melting and fine—Beurre d'Automne, Dix and Heathcote.—By Doct. S. A. Shurtleff, Broca's Bergamot and large sized handsome clingstone Peaches, one weighed 5 oz.

By Mr C. Cowing, three clusters of Black Cape from the vine which produced the very fine girdled fruit presented by him on a former occasion; it could not be perceived that they were injured by the success of girdling the other part of the branch. By Mr S. Pond, Black Hamburg, white Chasselas, Catawba, a handsome specimen of Isabella for premium, and Pond's Seedling, a very good variety of native grape, the skin thin, sweet and although it has pulp it is quite free of any foxy taste.

Grapes.—By Mr Charles Tappan, Isabella, fine specimen, and a handsome cluster of the Red Scuppernon, the berries compactly set and of uniform size, sweet with a pulp, free of the foxy taste, but not equal to the Catawba and it ripens latter.

By Z. Cook, Jr., Esp., Isabella, Catawba, large and fine, Selwykild Muscadell. This passes under various synonyms, is very thrifty and a plentiful bearer; it has a thick skin and hard pulp, with three seeds, and as a table grape is but little better than the best of our New England Fox Grapes. Also the Bland, which we think the best American grape; it has no pulp, and closely resembles the Royal Purple Chasselas, but as it ripens later than that or the White Chasselas, it can hardly be expected to succeed here in open culture.

Gen. Dearborn presented a handsome specimen of that excellent variety, the Orange Quince.

In behalf of the Committee on Fruits,

E. VOSE.

Roxbury, Sept. 30.

Hon. H. A. S. DEARBORN,

DEAR SIR—I send you a specimen of Mr Knight's Tillington produced between the Jargonelle and the Autumn Bergamotte. Some weeks since, I thought I must have made a mistake and that this was the Urbaniste. I have since seen a more full description of the Tillington, which is said to resemble closely the Doyenne Gris, and to have a stalk fleshy at its insertion. These two marks settle the point. I should not have distinguished it from the Doyenne Gris, but by its greater size. We have thought it fine, and the gentlemen of the Agricultural Society who tasted it preferred it to the Capiaumont and Bartlett.

One of these may be too advanced but the other will be perfect in a day or two.

I am Sir, &c, J. LOWELL.

TREES—IMPROVEMENT.

To the Editor of the New England Farmer.

SIR—I can bear it no longer. For long hopeful expecting years I have travelled the Salem Turnpike or at least a part of it, and no improvement yet meets the weary eye. The road so fine demands a corresponding excellence in surrounding fields, but the same marsh, naked, cold and cheerless, meets the wandering eye. Can you not, and will you not use your influence with the Saugus and Lynn people to cover their bleak hills, and desolate meadows with beautiful and profitable trees. Let each member of their Lyceums be a committee to obtain leave from the owner of every pasture of 20 to 100 acres to appropriate one acre or more for a nursery for oaks, ash, firs, Norway pines, and other useful trees; the Lyceum or some of its patriotic members to be at the expense of planting and fencing, with privilege of planting some 10 or 20 trees when sufficiently grown on each acre of naked pasture land, and on the borders of each field when a road runs by it. I do not know but sugar maples would do, as they afford a profit in ten years. One Locust planted or set out when well grown will cover a hill side with trees in 20 years without any care from the planter. The increased moisture produced by the trees would enlarge the streams which now in spring fertilize the few fields where they are found, and would distribute water throughout the year in many places. How beautiful the rivers of Saugus would appear with willows bending over their banks. The bold bluffs northeast of the Lynn Hotel, how much finer they would be with pines, firs, and noble oaks, among their ancient mossy rocks. The ultimate benefit to be derived from plenty of trees for the purpose of tanning and manufacture of cabinet work, are too distant to engage the attention of any but land proprietors, and they have been invited to do their duty to themselves some years ago, and are still urged by the Massachusetts Agricultural Society.

Touching another subject, do not the Lynn gardeners know the value of bits of leather and shoprefuse as a manure? if so, why allow the masses of rotten gelatine to lie about the doors of their neighborhood.

The new town which is promised on the Ferry grounds, will, I trust, inspire the neighbors with some horticultural propensity, and lead them to investigate the soil, and unfold its neglected wealth.

Yours,

ECONOMY.

Silk and silk Worms.

From the Lowell Journal.

SILK MANUFACTURE.

NO. VI.

Mr D'Homerque in conclusion of his essays observes, 'my chief view in the foregoing essays has been to prove, that the preparation of raw silk, called reeling, is an art without a perfect knowledge of which this Country can never expect to be able to manufacture silk stuffs, and is the great and most important object to be attended to at present; and that this art requires considerable skill and dexterity, and can only be acquired by experience and practice under proper instructors.'

Floss Silk, which consists of tow and the coarse fibres of the silk extracted from the cocoons, and of the waste and refuse silk collected during the process of reeling put together in a mass, then carded and spun on the common wheel, of which are made ribbons, silk tapes, stockings, gloves, mittens, night caps, vestings, and all kinds of hosiery, may be either sold as raw silk for exportation, or employed in the manufacture of coarse articles of the above description. But if it be intended to give to those articles any degree of fineness, the floss must undergo the same process as other raw silk. It must be wound, cleaned, doubled and twisted in the traveller, a machine made on the principle of the throwsting mill, but differently constructed, and of a much smaller size. This branch of domestic industry might very well take the place of the sewing silk of the Connecticut ladies, and find them an agreeable and profitable employment; and it would prepare the American weavers for making the finer articles, when the manufacture of thrown silk shall have been introduced into this country.

The American nation will, by gradual and sure steps, reach the desirable point to which her whole ambition should be directed; that in which her own native silk, that precious gift which a kind Providence has bestowed upon her with such excellence, and such extreme profusion, will fill the land and make America what France now is,—a country that no reverse can put down, and that conquest and the devastations of hostile armies cannot impoverish.

We hear of machines for winding silk from cocoons *without handling them*, which is absolutely impossible. We have heard of others by means of which silk can be reeled and twisted at the same time, which implies that reeling, winding, cleaning, doubling, and twisting, or in other words, that raw silk and thrown silk may be made by one and the same operation. I have no doubt however that the numerous machines employed in the different branches of the silk manufacture are destined to receive great and manifold improvement in the country whose future *Whitneys* will distinguish themselves as they have done in the cotton business; but every body will understand, that he who will improve upon a machine must first learn how to use it.

It is idle to think of importing journeymen, or women, who are acquainted with the business, for such are not to be found. If they would be induced to emigrate, we could not derive much advantage from them; each one knowing only that part of the business which the division of labor has allotted to him. Mr J. W. Morse writes from Marseilles, March 21, 1829, it is difficult, indeed, to

find a person who possesses a knowledge of the reeling and the different processes before being made into sewing silk; for it is done by four or more persons who have each his particular part, and continues through life doing nothing else: which keeps him ignorant of every other part. The reeling is done by women, and there are few men who are acquainted with that branch of business. There are very few in France or Italy who are acquainted with all parts of the process, and those few receive such liberal encouragement at home, that they will not go abroad.

If any gentleman from this place shall pass through Philadelphia during the present year, it is desirable that they should call on Mr D'Homerque, and have a free conversation with him on the subject.

From Prince's Pomological Manual.

PEACHES.

LARGE EARLY RARERIP. PR. CAT.

New-York Rarieripe. Cox's.
Royal Kensington. For. Lond. Hort. Cat.
Large Early. Lond. Hort. Cat.
York Rarieripe. Large early York.

This choice and beautiful variety was raised by the grandfather of the author, from the stone of the Red Rarieripe, and was transmitted by the present William Prince, a few years after our revolution, to Mr William Forsyth, author of the Treatise on Fruit trees, who had then the direction of the Royal Gardens at Kensington, near London, and it probably received the title of Royal Kensington from him. The flowers are of a small size; the fruit of a round form, and the skin of a rather darker red on the sunny side than its parent; the flesh is also rather more firm, equally rich, juicy, and of a luscious flavor; it parts freely from the stone. The tree is very productive, and is extensively planted for supplying the markets with fruit, its size, fine appearance, and other qualities, causing it to be much sought after. It ripens about the middle of August.

MONSTROUS LEMON. PR. CAT.

Largest Lemon. Lond. Hort. Cat.

This tree is of vigorous growth, and produces small flowers; the fruit is of the largest size, and in the gardens of two persons at New York has weighed seventeen ounces; the flowers are but thinly scattered over the branches, and the tree does not bear well, unless the situation is a sheltered one; the fruit is late in ripening, and in this latitude seems to require the warmth of a city or a favorable sheltered situation, to perfect its maturity. This variety was first discovered in the garden of Mr Tiebout, of York Island, and was sent, some years since, to the London Horticultural Society, with several hundred other varieties of fruits, at their express desire.

HEATH. PR. CAT. COXE. LOND. HORT. CAT.

Heath clingstone. Lond. Hort. Cat.

The flower of this tree is of small size, and the leaf has smooth edges; the fruit is very large, of oval or oblong form, terminated by a navel at the extremity; the skin is white with a partial tinge of cream color when the fruit acquires its maturity, and those most exposed to the sun have a slight touch of pale red next the sun; the flesh is peculiarly rich and highly flavored, very tender, melting, and abounding in a greater profusion of juice than almost any other peach, it strongly adheres to the stone which often divides, so as to

expose the kernel. The tree is hardy and of vigorous growth, and so abundant in bearing, that it is often necessary to thin out the fruit on young trees, to prevent their being exhausted thereby, and their growth consequently impeded or stunted. It requires the ground around it to be kept cultivated or mellow, which will cause the fruit to be large and fair, and it is found to be in general longer-lived than other trees of its class. The fruit begins to ripen in September, but by being carefully placed on shelves in the fruit-room, it may be preserved till November, and the juice acquires an additional richness after being thus preserved some days, but if kept too long in that state, it shrivels and loses a portion of its juice and fine flavor. It is in great repute for preserves in sugar and brandy, and there can scarcely exist another peach superior to it for these purposes.

The following history of its origin from the pen of William Prince, the present senior proprietor of the Flushing Nurseries, differs from that of Mr Cox's—it is possible that two seedling varieties originating in different places may have produced fruit so similar as to blend them with each other.

The original tree was discovered growing wild on the farm of the late Judge Willet, of Flushing, and it was called Heath clingstone, from the circumstance of its being found in a barren field or heath, as the old English settlers sometimes termed such lands as were left uncultivated. My father cultivated it many years before the revolution. It has the peculiar property of perpetuating itself from seed with but a partial variation in most cases from the original; the fruit of some of the seedling trees being rather more firm, and that of others varying a little in the period of maturity, but the whole having a general affinity.

KENRICK'S HEATH. PR. CAT.

This freestone variety I received from the Messrs Kenrick, who obtained it from the late Gen. Heath, of Roxbury, near Boston. The flowers are of medium size; the fruit is oblong, with a deep cavity at the insertion, and a slight navel at the extremity; it has also a groove, or suture, extending almost from the base to the summit, which is sometimes very deep, but in general only slightly depressed; the skin is a greenish yellow, touched with reddish purple on the sunny side, and sometimes of a purplish hue around the insertion; the flesh is greenish, extremely juicy, of a pleasant subacid, but not high flavor, and is occasionally somewhat stringy; the stone separates from the flesh and is apt to split. This fruit is one of the largest cultivated in New England, frequently weighing half a pound, and sometimes more, and is strongly marked by peculiarity of appearance; it ripens at Boston about the 20th of September, and in this vicinity a week earlier; the tree is of the most vigorous growth, and produces good crops.

MUSHROOM.

The uses of this vegetable do not appear to be well understood in this section of country. It belongs to the 22d Class (Cryptogamia) and 6th Order, (Fungi) *Genera*, Agaricus; species, *Campestris* L. Gillis pink color, stem white, with volva.

Mushrooms are to be found in pastures during the month of September, and when well prepared are relished by most people. When served up as

an accompaniment with beef steak, we consider them a luxury. When boiled, stewed, broiled or pickled, they are excellent; and from them is prepared one of the finest *catsups* brought upon the table. From the near resemblance which the mushroom bear, to the toad stool, which is a poisonous plant there is a strong prejudice against them with many who are not sufficiently acquainted with them to distinguish between them in all cases.

As the season has now arrived for gathering them, we will give such directions as we hope will be sufficient for those who may wish to gather them, to prevent any mistake which might lead to injurious consequences. Those who are not well acquainted with them should select those of middle growth, when they may be distinguished by the following characteristics: The stem white and surrounded with a volva or wrapper a small distance below the top, which should bear a resemblance to an open umbrella. The gills underneath should be of a bright flesh or pink color, with a pleasant smell. The small buttons or young ones when they first come out of the ground are considered most delicate, but are not so readily distinguished from the deleterious kinds, by those unacquainted with them, as when they are more expanded. On the contrary the deleterious kind most common is of a dingy white, above and beneath, and has a sickly nauseous smell, sufficient to distinguish it from the other. When gathered mushrooms should be put into cold water and washed clean from any dirt which may adhere to them, after which, for general instruction cook them as oysters.—*Genesee Farmer*.

From the Western Ploughboy.

MR SAWYER.—In the fore part of May last, I had a valuable horse seized with the bots, and in a few moments was evidently in the greatest agony imaginable. My wife immediately referred me to the cure published in the second number, page sixteen of the Ploughboy. I immediately tried it, but was compelled to sweeten the milk with sugar. In a few moments after I drenched my horse with about three pints of it, he evidently was better and relieved of his distress; got up, shook himself, and whiskered after other horses.

At this time a horse doctor arrived, whom I had previously sent for, and like a bold Jacksonian, said he went the 'whole hog' for the spirits of turpentine. I told him I thought the horse better, but left it for him to say, as I was no horse doctor. He insisted on giving the spirits of turpentine by drenching. My horse's head was then reined up, and a half pint of the spirits turpentine poured into his right nostril, (as he refused to swallow it when turned into his mouth) and the effect was distressing. I observed to the doctor, the turpentine would be most likely to go into his lungs while his head was in that position; but the reply was no; with a nod of wisdom, as if the gods directed him. But, alas! for my poor horse! The application was a fatal one. He was seized while in the hands of the *know-everything*, and yet know-nothing doctor, with a distressing cough; it continued, and on the fourth or fifth day, his lungs were in a high state of inflammation, his breathing was laborious, his eyes were glassy, his thirst insupportable, his hoofs dry and crumbling, his mane began to fall off, thin stranguary ensued, dimness of sight, stiffness of the joints, serous blisters were on various parts of his body, deafness, suffusion of

mucus in the bronchia or windpipe, total blindness and death. Thus ended the services of a most valuable horse, that fell a victim to the caprice of a braggadocio mount-bank. Let the owners of property be careful, who they employ to doctor their horses, as well as themselves and families.

Since the death of my horse, I have conversed with a very intelligent man, who tells me he lost a very valuable horse by drenching with spirits of turpentine, in the same manner, and that he died with precisely the same symptoms. He is a man of undoubted veracity, by the name of Johnson, and lives in this county.

N. B. I have tried the milk and honey of late in a case of bots, and it produced immediate relief. I believe it to be an infallible remedy when followed with physic, it is a remedy that carries reason with it and no other should be made use of.

Yours, DANIEL ROBERTS.
Sandy Bluffs, Morgan co. Ill.

MODES OF FARMING IN DIFFERENT SECTIONS COMPARED.

In the Western States it is not uncommon for a farmer to have six, eight, or ten hundred acres under cultivation, in grass, grain, and other crops. We have frequently seen 200 acres of corn in one field in Ohio and Indiana. Corn in many places is raised without hoeing. Harrowing and ploughing once or twice are considered sufficient to secure good crops.

These statements will be almost incredible with our brethren at the East, who consider one or two hundred acres as much as any farmer can manage to advantage. On the other hand, some of our Western farmers will be astonished at the statement made in the preceding article, where it is said that 50 or 100 acres support large and respectable families in many instances in New England. The general opinion in the Western States is, that the Eastern farmers labor severely. 'This,' says Mr Niles, 'is a great mistake; they have much leisure because they do not waste time. With them, there is a place for everything, and everything is in its place. Their houses and cattle are attended to with clocklike regularity. Nothing is put off till tomorrow which can be done today. Economy is wealth, and system affords ease.—These men are seldom in a hurry, except in harvest time. And in the long winter evenings, or severe weather which forbids employment out of doors, one man makes corn brooms, another shoes, a third is a cooper or tailor, and if necessary, he can display his Yankee ingenuity in all these trades combined, or anything else which necessity requires. 'One woman spins, another weaves, another plait's leg-horn or grass bonnets, and a fourth makes lace,' while the fair daughters are attending to the concerns of the larder. 'Little children and the aged persons knit stockings.'—*Southern paper*.

The First Saw-Mill.—The old practice in making boards was to split up the logs with wedges; and inconvenient as the practice was, it was no easy matter to persuade the world that the thing could be done in any better way. Saw-mills were first used in Europe in the 15th century; but so lately as 1555, an English ambassador, having seen a saw-mill in France, thought it a novelty which deserved a particular description. It is amusing to see how the aversion to labor-saving machinery has always agitated England. The first saw-mill was established by a Dutchman, in

1663; but the public outcry against the new-fangled machine was so violent, that the proprietor was forced to decamp with more expedition than ever did a Dutchman before. The evil was thus kept out of England for several years, or rather generations; but in 1768, an unlucky timber merchant, hoping that after so long a time the public would be less watchful of its own interests, made a rash attempt to construct another mill. The guardians of the public welfare, however, were on the alert, and a conscientious mob at once collected and pulled the mill to pieces. Such patriotic spirit could not always, last and now though we have nowhere seen the fact distinctly stated, there is reason to believe the saw-mills are used in England.—*V. Y. Paper*.

Coal.—*Lackawanna Coal cheaper than any other species of fuel.* In the city of New York, where the consumption of fuel is immense, it has become of great consequence to ascertain which species is, relatively, the cheapest, and from the following statement, which we extract from Burrill and Clayton's Price Current, Anthracite, (Lackawanna) it appears, has the advantage over every other sort of fuel.

Liverpool coal, at \$10 per chaldron, delivered, is for 36 bushels, twentyseven and three quarters cents per bushel.

Lehigh coal, at \$9 50 per ton, delivered is for 28 bushels, thirtyfour cts. per bushel.

Schuykill coal, at 9 50 per ton, delivered, is for 29 bushels, thirtytwo and three quarters cents per bushel.

Lackawanna, coal, at \$8 per ton, delivered, is for 33 bushels, twentyfour and a quarter cents per bushel.

It appears, therefore, that the

Price paid for 36 bushels of Liverpool coal, will purchase 41 and a quarter bushels of Lackawanna.

Price paid for 29 bushels of Schuykill, will purchase 39 bushels of Lackawanna.

A ton of Anthracite coal is estimated to be equal to six cart loads of hard wood (N. Y. measure).—*Ulster Sentinel*.

Smoking.—The saliva serves the important purpose of mixing and preparing the food for the stomach; hence it ought not to be unnecessarily squandered by frequent spitting. The strange custom of smoking tobacco is on that account extremely hurtful, as it weakens the organs of digestion, deprives the body of many useful fluids, and has a direct tendency to emaciate it, particularly in young persons and those of lean and dry fibres. To these it is the more detrimental, that it promotes not only the spitting of saliva, but likewise other evacuations. The practice not only vitiates the digestion, but impairs the understanding, and stupefies the powers of the mind.—*Dr Willrich*.

In reply to a request in the New Haven Advertiser, for a remedy for sheep or cattle poisoned by eating wild cherry leaves, S. J. Tufty, Esq. Saybrook, Conn. recommends a liquor strained from the leaves of the plantain bruised, and a little hot water poured upon them, used as soon as it is cold. A gill is sufficient for a sheep; but for a bullock he has never tried it.

A health peach was recently raised on the Mineral Spring farm, Richmond, weighing 10 oz. and measuring 10 1-4 inches round.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, OCT. 5, 1831.

FARMER'S AND GARDENER'S WORK FOR OCTOBER.

Potatoes. Judge Buell of Albany, who is a practical as well as a scientific cultivator, says it were better that the sun never should shine upon potatoes—they should be housed with all the dirt that adheres to them. It is even beneficial to add more dirt to potatoes in the bin or cask, to exclude external air as much as possible; their surface should be kept moist, and the atmosphere which surrounds them as little above the freezing point as possible.

Leaves for Manure. In many situations it will be an excellent practice to rake together all the leaves of trees and mould which has been produced by their decay, which can be procured at a reasonable expense, and cast them into your barn yard, as a layer to absorb the liquid manure from your cattle. Likewise it would not be amiss to place quantities of them under cover, in situations where you can obtain them in winter to use as litter for your stables, &c. They do not rot easily, but they serve as a sponge to imbibe and retain urine, and convey to the field much food for plants which, otherwise, might be lost.

Winter Apples. Gather winter apples by hand in the middle of fair days, and by putting them down in sand, well dried, it is said you may keep them till apples are again in season. Any kind of sand will answer, but it must be perfectly dry. Brande's *Quarterly Journal* informs that apples may be kept the year round by being immersed in grain, which receives no injury from the contact. If the American apples were packed among grain they would arrive in Europe in much finer condition.

Seed Corn. Select your seed corn from the field, culling fine, fair, sound ears from such stalks as produced two or more ears, taking the best of the two.

Field Beans. Pull your beans; and such as grow on land which you intend to sow with wheat or rye should be removed to the borders of the field, or on to the field adjoining, in small heaps to cure lest your sowing should be too long delayed.

Preservation of Roots. Previous to the commencement of severe frosts you should take up with as little injury as possible, the roots of your turnips, carrots, parsnips, beets, &c., &c., and they may be preserved according to McMahon as follows. 'On the surface of a very dry spot of ground, in a well sheltered situation, lay a stratum of sand two inches thick, and on this a layer of either sort, covering them with another layer of sand, (the drier the better) and so continue layer about of sand and roots till all are laid in, giving the whole on every side a roof-like slope; then cover this heap or ridge all over with about two inches of sand, over which lay a good coat of drawn straw up and down, as if thatching a house, in order to carry off wet, and prevent its entering the roots; then dig a wide trench round the heap and cover the straw with the earth so dug up, to a depth sufficient to preserve the roots effectually from frost. An opening may be made on the south side of this heap, and completely covered with bundles of straw, so as to have access to the roots at all times when wanted either for sale or use.

Some people lay straw or hay, between the layers and roots, and immediately on the top of them; this I do not approve of as the straw or hay will become damp and monthly, and very often occasion the roots to rot, while the sand would preserve them sweet and sound.

All these roots may be preserved in like manner in a cellar; but in such a place they are subject to vegetate and become stringy earlier in Spring. The only advantage of this method is, that in the cellar they may be had when wanted more conveniently during winter, than out of the field or garden or from heaps.

Note. All the above roots will preserve better in sand than in common earth; but when the former cannot be had, the sandiest earth you can procure must be dispensed with.

ISABELLA GRAPES.

Mr WILLIAM BYTES of Cambridge, Mass. has two Isabella Grape Vines, planted in 1827, when they were but one year from the ship, and about the size of a quill, that have borne this year 2500 bunches of fruit, as near as they can be computed from counting the produce of several branches, and averaging the whole. This inestimable variety of grapes, in our opinion, has never been overrated. If they are only suffered to remain on the vines till fully ripe, they are delicious. They should not be gathered in New England till about the 1st of October, and if they have had two or three frosts, so much the better. As they have a fine appearance, and seem to be ripe early in September, they are then frequently gathered, are extremely sour, with a hard pulp, and of course have thus acquired with many a doubtful character. But for vigor of growth and abundant yield, it certainly exceeds any other vine cultivated in this country. It requires no protection in the winter. Gen. Swift has raised from a single vine eight bushels for several successive seasons. Four vines set out in Bristol, R. I. in 1823, produced in 1826, five bushels of fruit. In some instances larger products have been known, and many vines are now to be met with in various parts of the country, producing astonishing crops. The fruit may be dried as raisins; and to our own knowledge they have been kept in good order till January in dry saw dust. When this wholesome, pleasant fruit can be raised with such facility, every farmer should feel it a duty to plant out one of the vines, as the expense would not exceed 50 cents.

Sweet Potatoes Squashes.—We were kindly presented by Mr J. Winship of Brighton, with several very elegant squashes, which have received the above appellation. We found them very fine, particularly for pies. A few of the seeds for gratuitous distribution may be had at the Farmer Office.

As the toast of Gen. DEARBORN at the Horticultural Dinner, was accidentally omitted last week, and an error made in Mr Cook's, we now insert them both correctly.

By H. A. S. Dearborn, President.—*Rural and Intellectual Cultivation*—the rival labor of Hercules in the Hesperian Garden, rewarded with golden apples and the fruits of immortality.

By Zebadiah Cook, Junr., Esq., First Vice President, (after the President had retired).—H. A. S. DEARBORN, the President of the Massachusetts Horticultural Society.—The scientific and practical Cultivator—the annals of our Institution attest the value of his labors; the gratitude of his co-operators is cheerfully and liberally accorded him.

From the Essex Register.

ESSEX CATTLE SHOW.

The Annual Agricultural Exhibition for the County of Essex, took place on Thursday last at the South Parish in Andover.

The day was highly favorable—the attendance numerous,—and the Exhibition in all its parts well sustained.

The Pens were entirely filled with animals exhibited for Premiums among the number were

11 Bulls,
7 milch Cows,
8 Heifers,
10 or 12 Yearlings,
12 pairs of Steers,
21 pairs of working Oxen,

and many other good animals, exhibited from the neighborhood, though not entered for premium.

A team of one hundred and fifty pairs of working oxen, principally from the North Parish in Andover, paraded the streets, and marched and counter marched, with as much precision, to say the least, as many other troops we have seen, and were viewed with as much interest. Great credit is due to the enterprising farmers of this flourishing town for their public spirit in bringing forward this interesting exhibition. It far exceeded anything of the kind, we have before witnessed, in this or any other County.

There were a few good swine in the pens—but this part of the exhibition was not equal to that of former years.

We understand, that no premiums are offered by the Society for fat cattle or sheep, and this accounts for none such being exhibited. At a time when sheep yield the farmers best profits,—in a County so well calculated to raise them as are many parts of Essex, we were a little surprised that this animal should not be thought a fit subject for premium. If we mistake not, very much may be done to improve flocks of sheep, by care in their selection, and judicious management.

The exhibition of domestic manufactures was not equal to some former years. Many of the articles were of good quality and deserving premiums. As the Society have always been disposed to be liberal in their rewards to the ladies, it is to be regretted that they on their part should be so backward in displaying the evidences of their industry. We doubt not that the ladies of Essex are as industrious as any others—we only wish that they would prove it so.

The following is believed to be, a correct statement of the premiums awarded:—

DAIRY.—Butter.

To Wm. P. Endicott, Danvers, 1st premium,	\$12
Jacob O'good, Andover, 2d prem.	10
Ralph H. Chandler, do. 3d prem.	8
Margaret Wandwell, do. gratuity,	5

PLOUGHING.—Double Teams.

To Ralph H. Chandler, Andover, 1st prem.	12
Abijah Northey, Boston, 2d prem.	10
Jedediah H. Barker, Andover, 3d prem.	8
Moses Pettingill, Topsfield, 4th prem.	6

Single Teams.

To Andrew Nichols, Danvers, 1st prem.	10
Joseph Kittridge, Andover, 2d prem.	8
John Pike, Danvers, 3d prem.	6

POTATOES.

To Richard Jaques, Newbury, 1st prem.	7
Samuel Gray, Andover, 1st prem.	7
Cyrus Follansbee, West Newbury, 2d prem.	5
James Locke, Andover, gratuity,	3
Asa T. Newhall, Lynnfield, gratuity,	1
Moses French, Salisbury, gratuity,	1

CIDER.

No premiums were awarded—as none of sufficiently good quality was presented—the following gratuities were given:

To John Cole, Boxford, a gratuity.
Kidder and Swift, Andover, a gratuity.
John Foster, do. do.
Daniel Foster, do. do.

ANIMALS EXHIBITED.

Bulls.

To Joseph Poor, Andover, 1st prem. 15
Samuel Jenkins, Jr., do. 2d prem. 10
Joseph Symonds, Boxford, 3d prem. 5

Cows.

To Samuel Noah, Danvers, 1st prem. 15
Isaac Osgood, Andover, 2d prem. 10
John Torrey, Newbury, 3d prem. 5
Ralph H. Chandler, Andover, gratuity.
Ebenezer Jenkins, do. do.
Samuel Hood, Top-field, do.

Working Oxen.

To Isaac Osgood, Andover, 1st prem. 8
Moses Petingill, Topfield, 2d prem. 5

Steers.

To Richard Heath, West Newbury, 1st prem. 10
Wm. P. Edicott, Danvers, 1st prem. 5
do. do. for 2 year olds, 1st prem. 5

Swine.

To Pierson & Gordon, Andover, for boar, 2d prem. 3
Pickering Dodge, Jr., Salem, breeding sow, 1st prem. 3
do. do. pigs, 2d prem. 3
George French, Andover, pigs, 1st prem. 5

The Milch Cows exhibited by Mr Noah, of Danvers, and Osgood, of Andover, were animals better worthy of premiums than any others that we saw.

Mr Noah's Cow, without any extra feed, other than that obtained from a common pasture, gave from the 2d of May to the 27th of Sept. 605½ lbs. of milk—measuring 586½ gallons—being an average produce of four gallons per day. The milk is of a superior quality. Mr Osgood's cow gave in the month of June seventeen quarts a day—and there was made from her milk in one month, fifty pounds of good butter.

There was awarded in premiums and gratuities, *Seventy-four dollars*, by the Committee on Domestic Manufactures—the particulars of which will hereafter be published.

OFFICERS OF THE ESSEX AGRICULTURAL SOCIETY,
ELECTED SEPT. 29, 1831.

EBENEZER MOSLEY, of Newburyport, *President*.

Hobart Clark, of Andover,
James H. Duncan, of Haverhill,
James Gardner, of Lynn,
Solomon Low, of Boxford,

Andrew Nichols, of Danvers, *Treasurer*.
John W. Proctor, of Danvers, *Secretary*.

Trustees.

John Adams, of Andover,
Daniel Adams, 3d, of Newbury,
Stephen Barker, of Andover,
Andrews Breed, of Lynn,
Henry Colman, of Salem,
Jeremiah Colman, of Newburyport,
Hector Coffin, of Newbury,
William P. Edicott, of Danvers,
Daniel Fuller, of Middleton,
Nathaniel Felton, Jr., of Danvers,
David Gray, of Andover,
Jonathan Legals, "
Berja, Jenkins, jr., "
Joseph Kittredge, "
Amos Kimball, of Boxford,
Daniel P. King, of Danvers,
Paul Kent, of Newbury,
Asa T. Newhall, of Lynnhill,
Moses Newell, of West Newbury,
Daniel Putnam, of Danvers,
Jesse Putnam, of "
Jeremiah Spofford, of Bradford,
Richard Stewart, of Haverhill,
Erastus Ware, of Salem.

Attest. J. W. PROCTOR, Sec'y.

Grape Vines.

For sale by the Subscriber, at his Garden in Dorchester, several varieties of Grape Vines, Scotch Gooseberries, Althaus, and Forest Trees. Among the former are

5 Black Hamburg,
3 Oval Purple,
1 Round Black, } 2 to 4 years old—have borne fruit
1 White Muscadine, } the present year.
1 White Chisselas,
1 Constantia.

Black and white Moscatel—one year old. The potent vines are represented to have borne clusters weighing 25 lbs.

Barcelona, a beautiful fruit, one year old.

Polonia, } Procured for me by the Consul at
Mantua Castel, } Cadiz, and said to be the most val-
lana, } uable Grapes produced in Spain.

4 De Peta,
1 Clarence, or No. 13, a valuable variety, and great bearer.

1 Isabella,

1 Catawba, } Native.

1 Bland,

5 With many other sorts.

Orders for any quantity of the above will be promptly executed, on application by mail, or otherwise, at the Garden, or at 7½ Congress street,
Oct. 5. 5t ZEBEDEE COOK, Jr.

Linnæan Botanic Garden and Nursery,

WILLIAM PRINCE & SONS, PROPRIETORS.

In addition to the large stock of other Trees, Shrubs and Plants, particular attention has been paid to the following, which are now offered at reduced rates in large quantities.

Grape Vines, of the finest kinds, for wine, and table fruit, among which are the choice Rhénish, Champagne, and Burgundy varieties, at \$25 per 100, and other Wine Grapes, at \$12.50 to \$20 per 100.

1 Isabella Vines, 3 years old, \$25 per 100, and one year old, \$20 per 100.

Catawba Grape Vines, \$30 per 100.

Also, Scuppernon, Alexander, York Lisbon, York Madeira, Vines, &c, at \$25 per 100.

Spanish Chestnut trees of large size; Spanish and English Filberts, of large size; French Quinces and other varieties of bearing size; Madeira Nut or English Walnut of large size; Gooseberries of the largest kinds, of bearing size; Dutch Currants of large size; White and Red Antwerp Strawberries, strong plants of the true large kind; Almond trees of the finest kinds; Fig trees of large bearing size; Mulberries of all the finest kinds, including the *New Chinese*, or *Morus multicaulis*, the latter at 75 cts. each, or less in quantities; English White Thorns, and Washington Thorns; Royal Oak, with beautiful foliage, and famous for timber, trees 4 feet high, \$10 per 1000, or \$50 per 100. Fifty varieties of the finest Strawberries, at very low rates, by 100 or 1000.

Above 600 varieties of the most splendid Roses, including 100 kinds of Chinese Monthly Roses. Also of the Camellia Japonica, or Japan Rose, above 70 magnificent kinds at reduced prices. Roses by the 100 or 1000 for Rosewater plantations, will be furnished at low rates.

The Fruit Trees are of superior size and vigor, and most of the Plum trees are on the celebrated *new stocks*, and Peaches, Nectarines, and Plums can be furnished, budded on the famous French Almond stocks.

Their Treatise on the VINE, describes 280 kinds of Grapes and their culture.—Their Treatise on HORTICULTURE contains descriptions of a great variety of Trees and Plants, and directions for cultivating them;—and their PONOLOGICAL MANUAL, just published, contains full descriptions of above 600 varieties of Pears, Plums, Peaches, Cherries, Apricots, Nectarines, Almonds, &c, besides other Fruits, so that all persons can make their selections, with a knowledge of the qualities.

All letters requesting information will be promptly replied to, and orders can be sent direct to them or to the subscriber, either of whom will furnish Catalogues of the Establishment when desired.

Oct. 5.

Is

J. B. RUSSELL.

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with an extensive assortment of Watches, Silver and Plated Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c, &c, which he will dispose of at as low a rate as can be purchased in the city. □ Watches repaired and warranted.

Oct. 4.

If

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed. Aug. 3.

Amputation.

Of the best quality and *lowest prices*, for sporting—constantly for sale at COLELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. 11 Jan.

Green House Sashes.

For sale 30 or 40 Green House Sashes, second hand without glass—each sash about 8 feet long. Apply at the New England Farmer Office. 4t Sept. 7.

New England Farmer's Almanac for 1832.

Just published by J. B. Russell, at the office of the New England Farmer, 52 North Market Street, and Carter, Hindee & Bibeck, Washington Street, the New England Farmer's Almanac, for 1832, by T. G. FISENDEN, Editor of the New England Farmer—the Astronomical calculations by ROBERT T. PAINE, Esq.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention. EBENEZER WIGHT,

16, Milk street, opposite Federal-st., Apothecary. August 3. copft

Bulbous Flower Roots.

For sale by J. B. Russell, No. 52 North Market Street, Boston—

A few Double Crimson Peony Roots—50 cents each. Large white Lily Roots, extra size, 12½ cents each—\$1.00 per dozen. Hyacinths, Tulips, Narcissus, Iris, &c.

Wanted,

An able bodied Laborer, who has had experience in the management of hot beds, and forcing early vegetables for market. Apply at his office. Sept. 28.

BRIGHTON MARKET—Monday, Oct. 3.

[Reported for the Chronicle and Patriot.]

At Market this day 7491 Beef Cattle, 1155 Stores, 2665 Sheep, and 1385 Swine. Probably 100 Cattle, mostly Stores, were reported last week. Business was remarkably brisk. The barterers exhibited a little, but not anxious to purchase many. Large numbers, however, of Cattle, Sheep and Swine were sold.

PRICES.—Beef Cattle—We shall quote for prime, 4 75 a \$5; good, 4 4 50; thin, 2 75 a 3 75.

STORES—Buyers were plenty and prices rather advanced.

WORKING OXEN—More were at market than we recollect of having before seen in one day. We noticed sales of pairs at \$15, 50, 60, 62, several at 70 and 75, one at 80 and one at 85.

COWS AND CALVES—Sales were made at \$13, 18, 22, 25, 25 and 27.

SHEEP—Remarkably brisk and an advance was effected. We noticed sales of lots at \$1 67, 1 88, 2, 2 25, 2 37½, 2 64, 2 75, and 3.

SWINE—Selected lots, two thirds Barrows, at 4½ a 4½; lots of old Barrows at 4 a 4½; and one entire lot of 350. Sows and Barrows, at 2½. Retail price 4½ a 5 for Sows, 5½ a 6 for Barrows.

New York Cattle Market, Sept. 30.—Market for

Beef Cattle this week full as brisk as last, and no alteration in prices—1000 head in, and all sold at \$5 50 a 6, and a few very fine at \$7. Sheep and Lambs about 2000 to 3500 in market, sales very brisk—no variation in prices. Sheep \$2 50 to 5; Lambs \$2 to 3. Fat Hogs rather more plenty and prices a little lower; quote, \$14 a \$15. Store Hogs \$1. Sales of Cows and Calves 29 a 35.—Daily Advertiser.

□ In the New York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

PRODUCTIONS OF ST THOMAS.

☞ The following description of the fruits of St Thomas we have taken from a manuscript account of the Island, its plantations, vegetable productions, animals, &c, furnished us by an intelligent and observing young man, for a few years attached to our Establishment, now a resident at St Thomas.

FRUITS.

Forbidden Fruit is one of the largest fruits known here; is about 18 inches in circumference, round like an orange; of a light yellow color, and resembles the orange much in taste.

Mangoes are one of the richest and most delicious fruits in the West Indies; are a native of the East Indies, and were first brought here about 30 years since; are shaped like an egg, and about the size of a very large pear; the skin is thick and smooth; the color yellow tinged with red; the flesh is of a rich orange color, and in flavor somewhat resembles a peach, having a rich combination of acid and sweet, and very juicy; the tree is very beautiful, of the shape and size of a cherry tree, with broad leaves.

Guavas are a small but delicious fruit, and grow wild on bushes which resemble the American black alder; they are about the size of a large plum; of a yellow smooth skin, and the flesh a light red color; the flavor is similar to a ripe gooseberry.

Bananas are about the size and shape of a cucumber, but more pointed at the ends; the color is yellow, the skin thick, which peels off very easily; the flesh is soft and very sweet and nutritious; they grow in clusters of from 10 to 20 on a stalk; the trees grow to the height of 12 feet, covered with leaves from 10 to 12 feet long, which grow in abundant clusters.

Pomegranates are much celebrated for their beauty and their delicious juice; are perfectly round, the size of an apple; the color a rich scarlet; spotted with yellow and black; the skin smooth with a beautiful gloss; the inside is curious, being composed of small separate pieces of flesh, with transparent skin, about the size of a currant, but oblong; the tree resembles the orange tree.

Sour Sops are a large, irregular shaped fruit; color green; flesh white, very soft and juicy, and has a pleasant mixture of acid and sweet, resembling the strawberry; the trees have a rich, dark green foliage.

Shaddock is what I should call mammoth oranges; resembling that fruit much, but are twice as large.

Pine Apples I need not describe; I would remark, however, they have a much sweeter and more sprightly taste when eaten here fresh.

Cocoa Nuts grow here in abundance. The tree is a sort of palm, from 40 to 60 feet high, with leaves on its tops only, appearing like immense feathers 10 to 15 feet long, by 3 broad, and winged—the upper ones erect, the middle ones horizontal, and the lower ones drooping. The nuts hang in clusters of ten or a dozen together. Many of the roads are lined with these trees, which make a beautiful and romantic appearance.—When green the fruit is very fine; the meat, instead of being hard, is a soft jelly, and the water is very sweet.

Messibles grow on vines, and are about the size

of a peach; the skin brown and rough; the flesh excessively sweet, soft, and full of juice.

Tamarinds grow in pods of a brown color, about the size of large beans. Some kinds are comparatively sweet, and some are so acid as to take the skin off the mouth and tongue.

Cog Monts are round, the size of a peach, are yellow and purple, skin smooth, flesh sweet and rich.

Sugar Apples are a curious fruit; shape irregular; the color a light green; and the size about that of an apple; the flesh is not solid, but composed of small long pieces growing together, which come apart when eaten; the fruit is full of juice and sweet with little acid.

Marmey Apples are a large fruit, with a rough, brown skin; they are about the size of a cocoa nut, but more round; the flesh is somewhat harder than an apple, and of a dark orange color, the taste resembles the apple, mingled with the flavor of the peach.

Gooseberries (as they are called here) are about the size of a cherry; the color a light yellow when ripe; they have a strong acid taste, and make excellent tarts and pies. They grow on branches on large trees.

Grapes. There are three kinds which grow here; the malaga, and a small black kind, the latter very sweet; there is also the Sea Grape which grows on large trees by the Sea Shore.

Sherries resemble our black Tartarean cherries very much; of the same size and color; the taste acid, with little sweet. They make excellent pies, and tarts.

Plums.—These are about the same size as the Plums in America; the color is red, and the taste much like the sheries.

Bell Apples grow on vines, and are of the size of a small apple. The skin is yellow and smooth; they are very sweet and rich; the method of eating them, is, to bite off one end and suck out the inside, they being very soft like the Guava.

Alligator Pear is a very valuable fruit, particularly for the table. The shape, color and size resemble exactly our Winter large Pears, only the skin is smooth; in the centre is a large round seed; the flavor has no acid or sweet, but a rich, buttery taste. When used for the table it is peeled and eaten with pepper and salt; the flesh is very soft. The tree grows to the size of our pear trees.

Kinneps are about the size of a Plum, with a thick green skin, which peels off whole; when off, the flesh looks like the yolk of an egg; the taste is a mixture of acid and sweet—are very juicy.

Pomrose, a small green fruit, having a delightful fragrance; they are hollow inside, with two large seeds, which rattle when shaken. They have a sweet spicy taste, combining the rose and nutmeg.

Bread Fruit are of the size of a child's head; when roasted and eaten with salt and butter, they serve for bread. They are hard and white like a yam.

Pourpae.—This fruit grows on a small tree resembling the castor-oil-bean plant, but larger; it is of the size of a small musk melon. It is cut into slices, like citron, and preserved in syrup.

The two following kinds I have not seen, and cannot describe, viz. Custard Apple; and Granadilla, which grow very large on vines.

Black Currant Wine.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A further supply of superior old Black Currant Wine, made under the inspection of John Prince, Esq. Roxbury; an account of its stringent and detergent properties in various complaints, will be found in the N. E. Farmer, vol. 5, page 267, written by S. W. Pomeroy, Esq. and the late Doct. J. G. Coffin. It is highly salutary in many summer complaints. Doct. Coffin states:

"I have seen a number of cases with remarkable success in the early stages of cholera morbus and dysentery—and again also in the later stages of these diseases, after the symptoms of inflammation or torrid excitement had ceased. It has been strikingly remedial in the low states of typhoid and bilious fever. The late Capt. Gilchrist, who for several years followed the Batavia trade, and who had always suffered an attack of the severe cholera, which proves so destructive of human life in that climate, used to say that after he had this wine with him, and took two glasses of it every morning, he escaped the disease. On one voyage, his mate, who had not taken the wine, was seized with this complaint, when a bottle or two stopped its progress. We have not room to enumerate many other morbid affections in which this wine has proved successful. In sore throat it has for many years been considered almost a specific remedy.—Price 75 cts per bottle. Aug. 3.

Tulip Roots.

For sale at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston—

A splendid collection of Tulip Roots, now in fine order for transplanting, comprising some of the most beautiful varieties now cultivated in this vicinity, viz:

Marbled or mottled, dark stamens.
White and Purple, ditto.
Yellow and Purple, ditto.
Double Yellow Rose.
Double pale yellow flamed, (Passee non plus ultra.)
Crimson, yellow centre and yellow stamens.
White, shaded with red, dark centre and stamens.
Fine large yellow, with yellow stamens.
Double white, with red shades, (beautiful.)
Double orange brown, (very large.)
Double prony rose.
Double coffee color.
Parrot tulips, of several colors.
Fine bibeoms, (striped on white ground.)
Fine bazarres, (striped on yellow ground.)
Fine Rosy, on white, &c, &c. Price 12½ cts. each—\$1 per doz.

The above are of large size, and are raised from superior imported roots, some of which cost \$1 each.

Also, common tulip roots, of all colors, and of good size, price \$5 per hundred, suitable for those commencing a large tulip bed.

Also, Double White and Yellow sweet scented Narcissus—12½ cts. each—\$1 per doz.

Mixed Crocus roots—50 cts. per dozen. Aug. 3.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

☞ No paper will be sent to a distance without payment being made in advance.

NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, AT NO. 52 NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE).—T. G. FESSENDEN, EDITOR.

VOL. X. BOSTON, WEDNESDAY EVENING, OCTOBER 12, 1831. NO. 13.

COMMUNICATIONS.

UNDER DRAINING.

MR. EDITOR.—In a late number of your paper my friend Judge Buel, in an article on "underdraining" was pleased to speak in favorable terms of my practice in this species of improvement, of my culture in general, and to ask for some communication on the subject. As no one in our country has more successfully blended theory with practice in the various departments of husbandry than Mr. Buel, I appreciate this notice from one so competent to make improvements and so happy in his manner of detailing them to the agricultural community.

As regards underdraining and the many benefits resulting from it, my observation and experience fully corroborate all Judge Buel has said in its favor—indeed without this salutary and simple operation no inconsiderable proportion of many valuable districts of our country must continue little better than waste. It is generally total loss of labor to the farmer who attempts to cultivate wet lands in our rigorous climate, and by draining, these useless inhospitable acres have been found of the kindest and most productive character.

Having a surplus of stones on my estate beyond what fences require, I use the smaller and ill formed for drains; they have the advantage of brush in durability and of tiles in economy. My drains are for the most part 3 feet in depth, 2 feet in width at top, sloping to one at bottom. The bottom stones are largest and are carefully placed to allow the water to flow freely beneath, while above the small stones are thrown in at random, so that when leveled they are beneath the plough. Over these swingle tow, shavings or straw may be strown, after which the earth can be replaced by the spade or plough so as to present a rather higher surface than the grounds adjacent and the business is accomplished. —It is very essential that the descent be easy, neither too quick or too slow, and that all surface water be excluded, as it would speedily choke and destroy the underdraining.—I estimate the average cost of such drains at 62½ cents the rod. —It should be remarked, that underdraining is adapted to lands presenting sufficient declivity to carry off the springs and it is only the under water that is meant to be drained in this manner, while open ditches are adapted to the bottomlands for the conveyance of surface water.—I will state what appears to me the prominent advantages that the cultivator may promise himself by a thorough system of draining.

In the first place, he creates as it were so much additional terra firma, and adds essentially to the health of all around him by correcting the ill tendencies of excessive moisture.—He can cultivate reclaimed lands several weeks earlier and as much later in each year than those that are unreclaimed, his crops are better and more sure. The labor of after tillage is much diminished. The stones that impede the plough and sythe are removed, and not the least essential benefit, is the constant supplies of water which may be insured in any field inclining to moisture, which with reference to animals will, as a permanent convenience and advantage, fully compensate the expense of drains.

I have just put down a field of wheat which has required extensive underdraining. I will sketch a diagram of it for your readers. This field has required 250 rods of stone draining, and I hope to be remunerated the whole expense in the surplus crops of the two next years, to say nothing of the pleasure of witnessing the finest grains and kindest grasses taking the place of bull rushes and wild grass. I am, sir, your most obedient servant.

HENRY W. DELAVAN.

Ballston, N. Y. Sept. 27, 1831.

SKETCH OF A FIELD UNDERDRAINED.

CULTURE OF THE SWEET POTATO IN NEW HAMPSHIRE.

I have not heard of this valuable root being cultivated to any extent in this vicinity, or in this latitude, nor do I believe that there has been any proper attempt made. The last season I applied for a small quantity of seed, to Mr. Russell, the publisher of the New England Farmer, through his agent, and by some means, I received them quite too late to plant, and the potato much decayed and what few were sound were dried and wilted, and had little appearance of any vegetable life; I however planted them all together, hoping I might find some of them to vegetate, and then to plant them in proper order. By the last of June I found a small portion of them had vegetated, and accordingly planted them, and tended them as well as I knew how, and had but a small crop as might be supposed; and was not a little pleased even under these unfavorable circumstances to have experienced the fact of raising about two bushels of small sweet potatoes.

After making use of about one half of them, I knew no better way to save the residue for seed, which were the smallest of them (and small indeed too) than to put them into a cask in my cellar, well mixed and covered with dry sand. Supposing them to be well taken care of, I did not look to them until the last of the winter, when

to my very great disappointment I found the sand to have settled and become quite moist, and every fibre of the roots entirely decayed.

From all these circumstances I concluded if I could procure seed in good season, in March or early in April, that they might be started in a hot bed, or some similar way, to plant as soon as the spring frosts were over that they might be grown to full perfection. Accordingly applied as before. As it happened they did not reach me till late, and they had then begun to decay. I was not able to plant them before the last of May, about one month earlier than the last season, which has operated greatly in favor of a crop. From one peck of seed, (not more than half of which were sound and vegetated) and notwithstanding they were planted very late, I am favored with a plenty of perfectly sweet potatoes, much better than any I have ever been able to obtain from the South or Middle States, and I think finer than ever I found there, having frequent opportunities of proving them. My little crop is very gratifying to be sure, for my family are numerous and all excessively fond of them; my average yield is a bushel from eight hills, which gives me about twenty bushels, produced on light loam.

I have seen in the New England Farmer some advice for keeping this valuable vegetable. The method most highly recommended, I think, was pulverized charcoal, which, if a safe way, is at best a very disagreeable ore. I should feel myself very much obliged if I should be advised from any one through your paper of the most safe and proper way of keeping them, also whether there should be any selection for seed, and what kind. Yours. A. R.

Portsmouth, N. H. Oct. 4, 1831.

☞ Sweet Potato slips are not generally received in Boston from the South, for sale, till about the middle of April. It would be useless to try to get them sooner, for if they become in the least chilled on the voyage, they decay almost as fast as they are opened to the air. No economical method of preserving the slips for seed through the winter in New England has yet been discovered to our knowledge.—Ed.

FOR THE NEW ENGLAND FARMER.

PRESERVING POTATOES.

MR. FESSENDEN,—About two years ago, you published in the New England Farmer, on the authority of some French agricultural Journal, a new method of preserving potatoes for several years, fresh and fine, viz. by burying them in a dry situation several feet below the surface of the ground, so as to be entirely out of the influence of the heat requisite to produce vegetation.—It would no doubt be highly gratifying to many to learn, what has been the result of any experiments that may have been made, to test the efficacy of this new method of preserving that invaluable article of human subsistence. If you have received any satisfactory accounts on this subject, you will lay your agricultural friends under new obligations, by placing them before the public, and of whom, no one will be more obliged, than

A CONSTANT READER.

Keene, N. H. Sept. 29, 1831.

PAWTUXET FAIR.

The following reports were made by the respective Committees, to the Society for the Encouragement of Domestic Industry, at the Annual Fair held in Pawtuxet last week, and the following premiums were awarded.

ON NEAT STOCK.

The Committee on Neat Stock beg leave to report the following Premiums, as adjudged by them:

To John Foster, of Smithfield, for the best Bull,	\$12
Samuel Baker, of Warwick, for second best,	10
John Jencks, of Smithfield, do.	5
To John Green (S. W.) of Warwick, best Bull Calf,	5
To Arnold Aldrich of Smithfield, for second best,	3
To Timothy W. Dexter of Cumberland, third best,	2
To Wm. Waterman, Jr. of Coventry, fourth best,	1

The Cows offered had no certificates accompanying them, and are not entitled to Premiums.—The Committee recommend the following Premiums:

To Christopher Smith of Barrington, for the best Cow,	5
To John Arnold of Cranston, for second best,	2
To Charles Heaton of North Providence, for the best 2 year old Heifer,	6
To A. G. Alverson, for second best,	4
To Samuel W. Greene of Providence, for the best yearling Heifer,	4
To Christopher Smith of Barrington, for second best,	2
To Andrew Angell of Johnston, for third best,	2

GEORGE BURTON,
DEXTER C. ARNOLD,
LEWIS DEXTER,
WILLIAM LIPPITT,
THOS. W. GREENE.

The Committee beg leave to recommend, that 75 cents be paid to the owner of each and every Cow, Bull, Heifer and Calf, that have been placed in the Pens this day, as a compensation for driving their stock during the storm, the day and night previous to the Show. Excepting, however, those on which a Premium has been awarded.

ON HORSES.

The Committee on Horses beg leave to report that they have attended to the duties assigned them. Your Committee regret to observe a want of competitors in Stud Horses. Two only were exhibited for Premium; the young Yankee, owned by John C. Fenner of Johnston, and the young Highlander, owned by Benedict Kinyon of Richmond. Your Committee do not consider either of the horses entitled to the Society's Premium, but would recommend that the sum of five dollars be paid each.

To Bates Harris, Esq. of Cranston, your Committee award the first Premium of eight dollars on the best Mare and Colt.

To Abner Sprague of Cranston, for the second best, a Premium of six dollars.

Your Committee were happy to observe quite a competition for the premiums on Mares and Colts, and should have been happy to have noticed several of them in a more satisfactory manner.

Your Committee were happy to see exhibited by Mr Edward Eldridge of Mass. a very fine Stud Horse, (Sportsman) of English blood, sired by the celebrated horse Bussoral. Sportsman will stand the ensuing season at Brighton, near Boston, during the month of May, after that at Pomfret, Connecticut.

CHARLES ELDRIDGE,

For the Committee.

ON WORKING CATTLE.

The Committee on Working Cattle beg leave to report, that after viewing a number of yoke of Oxen, they have awarded the following Premiums, viz:

The first Premium to Caleb Congdon of Cranston,	\$8
Second Premium to Samuel Budlong of Cranston,	6

Third Premium to Stephen Angell of Cumberland, 4

On three year old Steers the Committee find a greater number than has been heretofore exhibited; they award as follows, viz:

The first Premium to Harris Kelton of Johnston,	\$6
Second Premium to Peleg Potter of Providence,	4
Third Premium to Enos Weedon of Johnston,	2

On two year old Steers, the Committee find the like improvement as to number and quality; they award as follows, viz:

The first Premium to Philip Arnold of Warwick,	\$5
Second Premium to Amasa Burdington of Gloucester,	4
Third Premium to Harding Knight of Cranston,	3

To Thomas B. Sprague of Johnston, for one yoke of yearling Steers, the Committee recommend to pay one dollar.

ELISHA OLNEY, for the Committee.

ON SHEEP AND SWINE.

The Committee on Sheep and Swine report as follows: that they have attended to the duty assigned them, and find very few animals of either kind entered for premiums, which we have no doubt was owing to the inclemency of the weather, and after a minute examination, have awarded the premiums as follows, viz:

To Charles Potter of Providence Island, the 1st premium for the best buck of half Saxony blood,	\$6
To Henry Seale of Cranston, for 2d best do.	4
To Henry Potter of Portsmouth, for the 3d do.	2

To Charles Potter of Providence, for the best ewes, six in number, the 1st premium of

To Henry Potter of Portsmouth, for the 2d best do.	4
To Isaac Randall of Johnston, for the best boar,	6
To Arthur Greene of Cranston, for the 2d best do.	4

To Richard Brown of North Providence, for the best pigs, two in number.

To Arthur Greene of Cranston, for the 2d best do, three in number,	4
To Andrew Angell of Johnston, for the 3d do. two in number,	2

All of which, is respectfully submitted.

THOMAS HOLDEN, for the Committee.

ON PLOUGHING MATCH.

The Committee on the Ploughing Match report as follows, viz:

Freeman Fisher of North Providence, first premium,	\$9
Isaac Randall of Johnston, second premium,	8
Thos. Badlong of Cranston, third premium,	7
Stephen Whipple of N. Providence, fourth premium,	6
Jonathn Cooke of Foster, fifth premium,	5
Henry Jennison of Cranston, sixth premium,	4
Peter J. Bigges of Johnston, seventh premium,	3
Earle Baker of Warwick, eighth premium,	2

There being four other competitors, and the work being all very well done, the Committee recommended to the Standing Committee to allow to the other four, viz: Arthur Greene, Henry Searle, Joseph Aborn, and Allen Knight, a Premium of one dollar each. The shortest time of performance 22 minutes, the longest 25 minutes, all without drivers.

ON SHOP MANUFACTURES.

The Committee on Shop Manufactures have awarded the following premiums:

To William Bullas, Providence, for files,	\$3
To Ambrose Ferron do, for fine Steel Slate,	3
To Robert Orrel, do, for fine Reeds,	3
To Geo. A. Rogers, do, for improved Lock,	4
To Noah Smith, Jr. do, for Razor Strops,	2
To Nich. Sheldon, do, for Beaver Hats,	3
To J. M. Butts, do, for imitation, do.	3
To Jas. J. Chase, Cranston, for Looking Glasses,	3
To Allen Brown, Providence, for white oak Work Stands,	3
To Nathl. G. Helme, do, for Iron Safe for Books,	3
To John Sherman, Warwick, for Corn Shelter, (if not patented.)	3

To Geo. A. Harrison, Pawtuxet, for box White Lead, a very superior article,

To Hall & Mitchell, Providence, for Boots,	5
To Jno. Fenner, Cranston, for the best Rakes,	5
To Anthony & Walker, Olneyville, for the best Roller Skins, Calf Skins,	4

To Anthony & Walker, do, for the best Sheep Skin,	4
To Jas. Greene, East Greenwich, for Fish Lines,	1
To Wm. C. Force, Providence, for Sault Boxes,	1
To R. Inman, Burdville, for Pitch Forks,	3
To Waldo Stone, Cranston, for bevel gearings,	2
All of which is respectfully submitted by	
JAMES F. SIMMONS, for the Committee.	

HOUSEHOLD MANUFACTURES.

The Committee on Household Manufactures report that they have examined the articles presented for premium and exhibition, and have awarded the following Premiums on the same.

The articles presented were not as numerous as at former exhibitions, owing to the state of the weather for two days previous to the Fair; but their quality demonstrate an improvement in Household Manufactures. But there were several articles presented for exhibition, which were not entitled to Premium, by the regulations of the Standing Committee, but which the Committee think worthy of honorable mention—these were 2 pieces of Satinet, presented by Henry Carpenter of Paskevile; 23 pieces of Calico, by Charles Potter, manufactured at Tiverton; and 5 pounds of blue mixed knitting Cotton, by Wescott & Abbot of Johnston. The Premiums awarded are,

To Roxana Greene of Warwick, for the best piece of Carpeting,	\$8
Eliza Thompson of Warwick, for the second best,	4
Sally H. Arnold of Warwick, for the third best,	3
L. F. Greene of Warwick, for the best Woollen Stockings,	2
S. F. R. Stafford of Warwick, for the best Linen Stockings,	2
E. W. Gardiner of Warwick, for the best Worsted Hose,	2
E. R. Cleveland of Coventry, for the best Woollen Flannel,	2

Eliza Thompson of Warwick, for the second best, Richard Waterman of Warwick, for the best Blanketing,

Almira Greene of Warwick, for the second best,	5
Thomas Balfour of Smithfield, for one Hearth Rug,	2
L. M. Ware of Providence, for one Wrought Muslin Cape,	1

Mary S. Fiske of Providence, for the best Lace Veil, 1
Eliza Thompson of Warwick, for a pair of Woollen Blankets,

W. Tibbitts of Coventry, for one Counterpane,	2
Harriet F. Ashon of Providence, for one Wrought Cape,	1

Roxana Greene of Providence, for Crickets, 2
Thankful Clark of Providence, for Rug,

" " " " for Mat,	1
" " " " for Table Carpet,	1
" " " " for Cushion Covering,	1

Ellen S. Smith of Providence, for two Lamp Rugs, 1
Sarah Smith of Cranston, for Children's Socks,

Sally H. Low of Warwick, for Half Hose,	1
Nancy H. Green of Warwick, for Woollen Hose,	1
" " " " for Woollen Stocking Yarn,	1

" " " " for a Counterpane, 2
Mary E. Holden of Warwick, for a Counterpane,

Lucy Warren of Warwick, for Linen Thread,	1
Miss Easton of Providence, for a Rug,	1
" " " " for a Rug,	1

" " " " for Cricket Covers, 1
Mary S. Richmond of Providence, for Wrought Reticules,

" " " " for Black Lace Veil,	2
" " " " for White Lace Veil,	1

Caroline C. Richmond of Providence, for a Lace Handkerchief, 1
Jane Hurlbut of Providence, for a Lace Veil,

Pawtuxet Female Charitable Society, for Hose and Socks, and sundry other articles,	5
Susan A. Harrison of Pawtuxet, for one Bead Purse,	5
A. M. Harrison of Pawtuxet, for a pair of Bead Bracelets,	5

E. A. Rhodes of Pawtuxet, for working a Child's Frock, 1
Aves Hunt, Deaf and Dumb, for a Knit Bedsread,

Providence Episcopal Philanthropic Society, sundry articles,	2
N. G. B. Dexter of Pawtuxet, for Cotton Stripes,	2

To be paid to the Weaver,	2
Miss Chadsy of Wickford, for a Hearth Rug,	1
" " " " for a Counterpane,	1
Hannah C. Price of Newport, Bead Watch Guard,	50
S. W. Greene of Providence, Bead Watch Guard,	50
ELISHA P. SMITH, for the Committee.	

ON BUTTER AND CHEESE.

The Committee on Butter and Cheese have attended to the duties of their appointment, and report that the specimens of Butter are more numerous than heretofore exhibited; the superior excellence of which they find it very difficult to identify. They have, however, awarded to

Thomas R. Greene of Warwick, the 1st premium, \$10
 To Ellis Smith of Johnston, 3d do 9
 To Thomas B. Brown of Warwick, 3d do 8
 To Susan Howe of Johnston, 4th do 7
 To Charissa Webster of Johnston, 5th do 6
 To Mary Budlong of Warwick, 6th do 5
 To Charles Burlingame of Cranston, 7th do 2

The Committee regret to say that the specimens of Cheese exhibited are not so numerous as usual, which is no doubt attributable to the inclemency of the weather. They have awarded the first premium

To Ellis Smith of Johnston, \$8
 For the Committee, WM. ANTHONY.

ON MULBERRY TREES.

The Committee on Mulberry Trees and Raw Silk respectfully report, that S. W. Greene, of Providence, is entitled to the premium of five dollars for having made the present year, 54 pounds raw silk, the only sample exhibited. That Lemuel Burges, of Wickford, is entitled to the premium of five dollars, for having raised the present year, 12,000 mulberry trees; and that E. S. Johnson, of Wickford, is entitled to the premium of four dollars, for having raised 1000 mulberry trees.—The Committee would also recommend that five dollars be granted to Joshua Collins, of Richmond, for having the last year raised seventy or eighty thousand mulberry trees. ASA MESSER,

In behalf of the Committee.

The Standing Committee allow and award to Wm. Lippitt of Cranston, for one barrel of Cider, \$3
 Attest, R. M. GREENE, Secretary.
 September, 28, 1831.

All of which is respectfully submitted by JESSE TOURTELLOT, for the Committee.

From the Concord Gazette.

MIDDLESEX CATTLE SHOW.

The Annual Fair of the Society of Middlesex Husbandmen took place, in this town, last Wednesday—and, notwithstanding the unpleasant state of the weather, there was a large collection of the yeomanry of the County. The display of Cattle this year was not quite so large as on former years, which may be attributed to the stormy weather—we counted, however, in the Pens: 9 Bulls; 2 pair of fat Oxen; 9 pair of Steers; 17 Cows; 17 pr. of Working Oxen; 7 Cows with Calves; and 25 Swine.—The Ploughing Match Premiums were contended for in good farmer-like style by 14 Teams; the result of which gave Ephraim Wheeler, of this town, for double team the 1st Premium; Isaac Brooks, of Lincoln, the 2d; Hezekiah Wetherbee, of this town, the 3d; Abel B. Heywood, of this town, for single team the 1st Premium; Henry A. Wheeler, of this town, the 2d; and Ichabod Stow, of Stow, the 3d.—The Strength of Working Cattle was displayed by 7 yoke of prime Oxen; Premiums were thus awarded—Ichabod Stow, of Stow, the 1st Prem.; Eli Rice, Marlboro', 2d; Geo. M. Barrett, of this town, 3d; and Jacob Baker, of Lincoln, the 4th.

The whole number of articles entered at the Court house for Exhibition and Premium amounted to 127, and exceeded that of last year. Among the articles exhibited we noticed 10 Coverlets; 9 pieces of Flannel; 10 Carpets; 4 pieces of Woolen Cloth; 2 pieces of Diaper; 10 Hearth Rugs; 6 Straw Bonnets; 13 Lace Veils; and a large collection of fancy articles. The following articles appeared to us as deserving of particular notice:

Mary Ann Rodgers, of Tewksbury, presented for annu nine pair of *Worsted Hose*—a beautiful specimen. Mrs Jonas Moore, of this town, presented one pair of do. which were not inferior to Miss Rodgers'. Mrs Betsey Jewett, of Pepperell, exhibited 12 pair of *Woolen Socks* that told well for her industry.

A good specimen of *Thread* was exhibited by Mrs Sarah Barnes, of Sherburne, who is in her 90th year. A similar specimen was presented by Miss Abigail Flint, of this town.

A pair of elegant *Blankets* were presented by Polly Rodgers, of Tewksbury; also a fine piece of *Flannel*. Mary Richardson, of Westford, also exhibited a pair of beautiful *Blankets* full equal to those of Mrs Rodgers.

A very fine specimen of *Silk Cocoons and Silk Worms' Eggs* was presented by our enterprising farmer, Mr Anthony Wright; also a good specimen of *Cocoons* by Mr William Munroe, of this town.

Mrs Susan Hoar, of Littleton, exhibited a beautiful *Wreath of Flowers*, made of *Straw*.

Miss Lury Howe, of Marlboro', presented a beautifully-fue specimen of native *Seeing Silk*.

Two crooked-necked *Squashes* one 53 and the other 50 lbs, were exhibited by Mr Mercer, of Lincoln: three *Squashes*, raised by Mr Moses Abbott, of Westford, weighing 266 1-2 lbs.; and several other ones of a very large kind were also exhibited.

A *Watermelon* was exhibited by Mr Phillip Spaulding, of Chelmsford, weighing 39 1-2 lbs. measuring 2 1-2 feet in length, and 2 in circumference.

Four bottles of *Castor Oil*, possessing all the freshness and sweetness of new butter, were presented by Captain Anthony Wright, of this town; it was made from the Castor Bean raised on his farm.

Capt. Francis Wheeler, of this town, presented *half a basket* of large and handsome *Potatoes*, being the produce of one.

Mr Moody Moore of Waltham, exhibited the produce of two hills (one peck each) of the *Sweet Potato*. Mr Anthony Wright, of this town, who has cultivated this vegetable for several years, also exhibited a fine specimen.

Mr David Dickinson, of Chelmsford, exhibited a fine specimen of the *Sugar Cane*, the *Bovary Bean*, and the *Georgian Peach*; Mr D. says: 'all these articles may be cultivated to advantage by our farmers.'

Apples were presented by Mr Timothy Davis, of Billerica, and several other gentlemen, of a very nice kind considering the *unfruitful* season.

A fine specimen of *Okra*, was exhibited by Mr Phillip P. Spaulding, who raised it in the town of Chelmsford.

Mr Nathaniel Jennings, of E. Sudbury, presented three *Winter and Summer Radishes*, of the turnip rooted kind; the largest weighing 9 lbs. and may be seen at our counting room.

About 30 Firkins and Boxes of Prime *Butter* were exhibited by different individuals.

Alpheus Smith of Lowell, exhibited a Carpenter's *Ploughing Plane* of superior workmanship; also a miniature *Fore Plane* and *Smoothing Plane*.

The Com. on Farms, &c, have awarded to Moses Sweetser, of South Reading, for the best Orchard, the 1st prem. of \$15; to Francis Richardson, of Billerica, 2d do. of \$10; the 3d prem. not awarded. To Nathan Smith, of Waltham, for the best Farm, the 1st prem. of \$25; to Moses Howe, of Marlboro', 2d do. of \$15; and to Martin Howe, of Marlboro', 3d do. of \$10.

At the close of the day the Society assembled at the Court House, for the declaration of Premiums, the choice of officers and the transaction of other business. A Committee, chosen last year for the purpose of taking into consideration the *location* of the Society, reported in favor of the Society's holding its Annual Meeting alternately in the towns of Concord, Lowell, Groton and Framingham; this report elicited considerable debate and was finally rejected by an almost unanimous vote, thus putting an end to a project of dangerous tendency towards the future harmony and stability of the Society. A vote was passed thanking the Orator for his able Address, and requesting a copy for the press. A Committee was chosen to audit the Society's accounts. Col. Shattuck having declined serving as Treasurer to the Society, a vote was passed thanking him for his faithful services for the last nine years. The Society then proceeded to the choice of officers for the ensuing year, and elected Elias Phinney, Esq. of Lexington, President; B. F. Varnum, of Dracont, and Abner Wheeler, of Framingham, Vice Presidents; Josiah Bartlett, of Concord, Corresponding Secretary; John Stacy, of Concord, Recording Secretary; and Cyrus Stow, of Concord, Treasurer.

We regret that we are obliged to defer the reports, and some other details till next week.

From the Taunton Reporter.

BRISTOL CATTLE SHOW.

The annual exhibition of the Bristol County Agricultural Society was held in this town last Wednesday. The unpleasant state of the weather in the morning may have been the reason why the display of cattle and manufactured articles fell somewhat short of what they have been on former occasions. We however noticed among the articles of manufacture, some which for excellency of material and beauty of workmanship, we doubt not would compare with any which will be exhibited in the country—among which were some beautiful specimens of Britannia Ware, manufactured in this place by the Britannia Ware Company; likewise a miniature steam carriage, made by Mr J. W. Strange, and which was in the afternoon exhibited in motion on a circular railway constructed for the purpose. We have understood that it is entirely an invention of his own, he never having seen anything of the kind. The simplicity of its construction, with the compactness of its parts, indicate much mechanical skill in the maker; the boiler holding about a pint, was heated by lamps from beneath, and was sufficient to keep it in motion for an hour's time.

The agricultural products were much inferior we have understood, from what they were the last year; and the competition for premiums on fat cattle, working cattle, sheep, &c, were very much less than on former occasions.—In fact, there was an evident falling off from former years in almost every description of articles of manufacture and products of the earth. We cannot but hope, however, that another year will evince a renewed interest in all classes of our citizens for the promotion and welfare of so valuable an acquisition to the farmer, the manufacturer, and mechanic, as this society is calculated to be, and that another Exhibition will show a large increase of manufactured articles, cattle, &c.

Further particulars will be given next week.

Silk and Silk Worms.

From the Lowell Journal.

SILK MANUFACTURE.

NO. VII.

The few numbers on this subject were given to the public without the expectation of instruction, but for the purpose of diverting the attention of farmers and manufacturers to the subject. Every new object of industry requires time and experience before it can be advanced to any considerable degree of perfection. The first planters of cotton seed in the United States had as little expectation that within forty years it would become the first staple in the country, as the planters of mulberry seed now have that raw silk will become the second staple. In the Northern and Middle States the farmers have no great staples which they can produce from their lands, although in some favored sections large quantities of flour are made; therefore they have a deep interest in advancing any species of agricultural improvements, which will give them a support for their families and a reasonable profit. Every prudent man will inquire how much the crop will cost and the amount of sales, before he begins to cultivate it, and I will give him such information as I have.

On the 12th of May last, I purchased in New York one pound of white Italian Mulberry seed for six dollars, and on the 23d I planted it on light loamy land, prepared in the same manner I prepare it for wheat or barley. I planted it in rows only 18 inches apart, and covered the first six ounces two inches deep, and almost every seed perished in the ground; but the remaining ten ounces were covered only half an inch, and in forty days they came up, and twenty thousand of them are about eighteen inches higher and look well. The whole expense of cultivation has been five dollars. I do not recommend this mode of cultivation. They should be planted early in April, in rows of four feet apart, and covered only one fourth of an inch deep; for the purpose of freeing them from weeds by a cultivator. I am now preparing ground for eight pounds of seed, by ploughing it often, and dressing it liberally with leached ashes. The labor of producing the worms from the eggs, feeding them, gathering the cocoons, and the other necessary attention, may be performed in 60 days, by two women and two children, for thirty thousand worms. This is the whole expense. Can a farmer plant a more profitable crop? If he can find a market, he certainly cannot. But unless we learn the art of reeling it from the cocoons in greater perfection than it is taught at present, it will never be purchased in a foreign market. The attention of gentlemen of capital has been turned to this subject, and we have no reason to doubt that machinery will be erected, and a good market found. The customary price for cocoons in France and Italy is 25 cents per pound; in England the climate is too cold and damp for them. About five thousand pounds may be produced on an acre, which will give the farmer \$1250. In this calculation a considerable discount must be made for want of skill, an unfavorable season, and various other accidents.

Onions.—Mr Eliab Byram of this place, has raised, the past season, on a piece of land 90 feet by 59, eightyseven bushels of onions.—*Sag Harbor Watchman.*

PROFESSIONAL ECCENTRICITY.

A country farmer of immense weight came from a distance to consult the late Dr Abernethy, and having given an account of his daily meals, which showed no small degree of addiction to animal food, Mr Abernethy said 'Go away, Sir, I won't attempt to prescribe for such a hog.' He was particular in not being disturbed during meals; and a gentleman having called after dinner, he went into the passage, put his hands upon the gentleman's shoulders and turned him out of doors. He would never permit his patients to talk to him much, and often not at all; and he desired them to hold their tongues and listen to him, while he gave a sort of clinical lecture upon the subject of the constitution. A loquacious lady having called to consult him, he could not succeed in silencing her without resorting to the following expedient:—'Put out your tongue, madam.' The lady complied. 'Now keep it there till I have done talking.' Another lady brought her daughter to him one day, but she refused to hear her or to prescribe, advising her to make the girl take exercise. When the quinea was put into his hand, he recalled the mother and said, 'Here, take the shilling back, and buy a skipping-rope for your daughter, as you go along.' He kept his pills in a bag, and used to dole them out to his patients, and doing so to a lady who stepped out of a cornered carriage to consult him, she declared they made her sick, and she could never take a pill. 'Not a pill! what a fool you must be,' was the courteous and conciliatory reply to the Comtesse. When the late Duke of York consulted him he stood whistling with his hands in his pockets, and the Duke said, 'I suppose you know who I am.' The uncertainty reply was, 'suppose I do—what of that?' His pithy advice was, 'Cut off the supplies, as the Duke of Wellington did in his campaigns, and the enemy will leave the citadel.' When he was consulted for lameness following disease or accident, he seldom either listened to the patient or made any inquiries, but would walk about the room imitating the gait peculiar to different injuries, for the general instruction of the patient.

A gentleman who could not succeed in making Mr Abernethy listen to a narration of his case and having had a violent altercation with him on the subject, called next day, and as soon as he was admitted he locked the door and put the key in his pocket, and took out a loaded pistol. The professor, alarmed, asked him if he meant to rob or murder him. The patient, however, said he merely wished him to listen to his case, which he had better submit to or he would keep him a prisoner till he chose to relent. The patient and the surgeon afterwards became most friendly towards each other, although a great many oaths passed before peace was established between them.—*London Metropolitan.*

INTEMPERANCE.

The following statement is from Deacon Grant, a highly useful and active Director in the house of Correction, in Boston. He stated the distressing fact, that the number of commitments there, from its establishment in June, 1825, exceeded 4300, being the annual average of over 500; and many of them are women. And, said he, it is a notorious truth, that but for intemperance, not one third of those sent there, of both sexes, would have been transgressors of our laws. A very large proportion of them were sentenced as 'common drunkards.'

To illustrate the degrading influence of this vice, it was stated, that there is now in the House of Correction, an individual, who, a short time since, was an instructor in one of our public schools, employed in breaking stone, for macadamizing the streets of our city! What a contrast! There is also employed in the same way, a youth of 17, the only hope of his mother, and she a widow, under sentence for three years. When she first visited him in his confinement, Mr Grant said he was present. So greatly was the mother agitated, that it almost appeared she would sink into the earth under her affliction. How came they here? I will, said Mr Grant, tell you from their own lips,—they were ruined at some one or more of our licensed houses. And he then added to these facts, which he said are stubborn things. 'This day, the father of a family of many children, inquired of me to know if any provision could be made to take care of her, who was once all he could wish, but now, alas! no longer the kind mother, the faithful wife! She had fallen a victim to Intemperance! While he related his sufferings, and spoke of his dear children, the tears rolled down his cheeks; and he said no tongue could tell, nor heart conceive, his sorrow! Such are the trophies of Intemperance.—*Christian Balmman.*

Preventive of fever.—The best commentary we can offer on the murderous practice still too general in sickly districts, of the inhabitants using daily their bitters, viz: spirituous tinctures and infusion of vegetable bitter and astringent substances, with the hope of warding off fever, is for us to lay before our readers the following from a highly respectable source.—The author is speaking of the malarial fever, in the country round Rome—diseases similar to our bilious remittent and intermittent fevers.

Puccinotti attributes the severity of the Roman fevers in many cases to the use of bark, spirits and other stimulants, which are by some used as preventives; and he relates the case of an old man, who had come from Romagna every second year, to labor during the harvest, in the Campagna of Rome, who never had the fever; and his beverage in the morning and through the day, was cold water with a little lemon juice. This practice his father had adopted before him, with the same success; but his two sons, who would use spirits (brandy,) and even mixed with it at one time gun powder and at another time cayenne pepper, both fell victims to the fever.—*Journal of Health.*

Alabama Hemp growers and Manufacturers.—It is said that some planters in the vicinity of Huntsville, (Alabama) are turning their attention to the cultivation of Hemp, and the manufacture of Cotton Bagging and Bale Rope. So far, their prospects are said to be very encouraging, netting them a much greater profit than the growing of Cotton had heretofore done.

The Garden of Fromont, six leagues from Paris according to Silbman's Journal, contains 130 acres, and more than six thousand species and varieties of vegetables; many of them still new in France. Some of the green houses are 2000 feet in length, with glazed roofs, possessing all varieties of exposure. Many of the noble forest trees of the United States have furnished contributions to the nursery of this garden.

Tomatoes are very easily raised—make good pickles picked green—and when ripe and properly cooked, a good dish for the table. They also make a fine catsup thus: Take 1 gallon skinned tomatoes, 4 table spoons salt, 1 of black pepper, 2 of allspice, 8 pods red pepper, 8 table spoons of mustard seed. Bruise all these fine, and simmer them slowly in a pint of vinegar for three hours; then strain them through a hair sieve—to be stewed down to half a gallon of catsup—put the catsup into bottles and cork it tight. From one large hill of tomatoes (on a spot 4 feet by 2) we raised this year at least a bushel and a half of tomatoes. To peel them, pour boiling water on them when the skin will come off easily. Hogs eat them with a great relish. Quercu—Might they not be advantageously used for fattening them?—*Kennebec Journal*.

Peach trees.—Mr B. Nason, of this town, who has devoted much attention to improvements in agriculture and horticulture, has this year raised peaches of a large size, and as rich in flavor as any to be found in the Philadelphia market. His trees are in a poor, gravelly soil, and sheltered from the northwest wind. Peach trees grow too fast in a rich soil, and do not bear fruit. They do best in a warm sandy or gravelly light soil, protected from cold winds. In the Spring it is believed to be a good plan to throw straw around the roots of the trees, to prevent the frost coming out too soon. After the rising sap starts the buds, a hard frost will kill them and the branches they are on. With proper care, this luscious fruit can be raised by almost every one who has a farm or a garden.—*Kennebec Journal*.

Chestnut and Walnut.—Mr Daniel Stevens, of Belgrade, in this county, has left at our office some twigs of chestnut and shagbark walnut, with very fine fruit on them, which grew on his farm. He has a number of trees, in a very thriving condition. The chestnut and walnut are not indigenous in Kennebec, and we believe not in any part of Maine; but they will grow here, probably, as well as any other kind of trees; and it is rather a matter of surprise that they have not been more generally introduced. There has been too much neglect in introducing valuable fruit and forest trees.—The walnut is valuable wood; besides a farm is much ornamented by having scattering walnut, chestnut, butternut, black cherry and other trees, at suitable distances from each other, serving for shade for cattle in summer, and yielding valuable fruit. We are glad to find that the public mind has begun to be somewhat directed to the planting of trees. It is very easily done. There are many varieties of trees which would be a great acquisition. The black walnut, which grows in many of the western states in abundance, is very useful for cabinet ware. So is the black cherry, which would grow here without doubt, as well as any where.—*Kennebec Journal*.

A large one.—A Cucumber was raised this season, by Capt. Alley of this town, measuring 16 inches in length, and 18 in circumference, and weighing 8 lbs. 9 oz.—*Sullivan Mercury*.

It is stated in the American Farmer that Mr Isaac Smith of Northampton co. Va. prepares Castor Oil, so that it gives a large bright flame, perfectly free from smoke or offensive smell. It can be afforded at 85 cts. Mr S. is about to take out a patent: It is father to Mr F. H. Smith, inventor of the musical instruments, the harmonicon.

From the Barnstable Journal.

The daughter of Col. R. M. Johnson, of Kentucky, was refused a seat under an awning to hear her father deliver a Fourth of July Oration, because 'some black blood was flowing in her veins. While the Colonel was eulogizing American equality and freedom, and repeating that 'all men are born free and equal,' his daughter for lack of a 'clear complexion,' was compelled to remain in his carriage.' In remarking on the above circumstance, the *Massachusetts Journal*, relates the following interesting anecdote:

'It is a singular fact that we republicans are abundantly more exclusive in our feelings in this respect than our monarchical neighbors. In England, it is common to see respectable and genteel people open their pews when a black stranger enters the church; and at hotels, nobody thinks it a degradation to have a colored traveller sit at the same table. We have heard a well authenticated anecdote, which illustrates the different state of feeling in the two countries on this subject. A wealthy American citizen was residing at London for a season, at which time the famous Mr Prince Saunders was there. The London breakfast hour is very late; and Prince Saunders happened to call upon the American while his family were taking their morning repast. Politeness and native good feelings prompted the lady to ask her guest to take a cup of coffee—but then the prejudices of society—how could she get over them? True he was a gentleman in character, manners, and dress; but he had a black skin; and how could white skins sit at the same table with him? If his character had been as black as hell, the difficulty might be overcome, however reluctantly; but his skin being black it was altogether out of the question. So the lady sipped her coffee, and Prince Saunders sat at the window, occasionally speaking in reply to conversation directed to him. At last all retired from the breakfast-table—and then the lady, with an air of sudden recollection, said 'I forgot to ask if you had breakfasted, Mr Saunders! Won't you let me give you a cup of coffee?' 'I thank you, madam,' he replied, with a dignified bow, 'I am engaged to breakfast with the Prince Regent this morning!'

'Ye that have tears, prepare to shed them now'.—The good people of Weatherfield will please to take notice that a quantity of common red onions have been imported here from the island of Madeira, one of which we have measured, and find it twentyone inches in circumference; it weighs three pounds and two ounces.—*Journal of Com.*

A Giant of the Forest.—A white oak tree on the land of Mr Grove, near Roxbury, Letterkenney township, Franklin county, Penn. being felled and cut up, produced the following, viz:—1400 shingles, 200 felloes, 2 saw logs, one 14 and the other 16 feet long, 4 rail cuts making 60 rails, and two cords of wood.

Home Industry.—Mrs S. of the town of Mansfield, Mass. has earned since the first of March last, (six months) \$85 by making straw bonnets, for which she has received the cash, besides taking care of a family of young children, doing the cooking, washing, milking two cows, making the butter for the family, taking care of a hog, &c, &c, all during the absence of her husband, who is following his occupation in a neighboring state.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, OCT. 14, 1831.

From the Augusta Courier.

SLOBBERING OF HORSES.

The New England Farmer of Wednesday has an article on the cause and cure of the salivation of horses, to which, respectable as is the authority, our own experience compels us to dissent. The editor concludes that salivation is produced, not by eating lobelia as has been generally supposed, but by white clover when it is very full of juice. He thinks, too, that a baiting of hay or oats, or a change of pasture, will cure the complaint.

What comes home to every man's business generally arrests his attention the most, and therefore we will relate a little experience on this point. Our own family jade—a hearty and kind creature,—has not enjoyed the luxury of grass for three years, and has always been kept in good trim on hay with very little provender. In July we had the barn filled with her year's stock of hay, sweet from the field. Soon after the horse began to eat of it, she commenced slobbering abundantly. Being quite out of patience, we set our wits at work to ascertain the cause. Some told us it was white clover, some that it must be lobelia. On making critical examination, we found that the last load put into the stable had much lobelia, but little white clover in it. To test an experiment, we, for several days in succession, previous to feeding, were careful to cull the quantum over by handfuls, and pick out the lobelia. From this moment the slobbering ceased. On giving the hay again, without picking it over, the salivation began again. So that our mind is satisfied that lobelia is the cause of slobbering in horses. Can any one tell us what will cure this slobbering without the pains of separating the lobelia from the hay? A true answer to this question would save us some trouble and vexation, and would no doubt be acceptable to the public.

Remarks by the Editor.—The article alluded to by the writer of the above is improperly attributed to the Editor of the *New England Farmer*. It was originally published in the *American Farmer*, republished by us, page 78 of our current volume, and credit given to the *American Farmer*.

There is much difference of opinion relative to the cause of the frothing and foaming at the mouth of horses in the fall of the year. This appearance is a symptom of a disorder called *Ptyalism*, *Salivation* of horses, *Slavers*, *Slobbering*, &c. Lovett Peters, Esq. of Westborough, Massachusetts, (who favored us with a communication on this subject, printed in New England Farmer vol. ii. page 58) was of opinion that the slavers in horses is caused by their eating the second growth of a kind of grass making its appearance in the fore part of July, much resembling oats, which came up in the fall after the crop had been taken off the ground. This grass is believed to be the *Spotted Spurge*, *Euphorbia maculata*, of which a botanical description may be seen in the *New England Farmer*, vol. ii. page 78.

There has been, however, a great variety of opinions relative to the cause of this disorder. J. A. Peters of Penn. thought its true cause had not been ascertained, and asserted that hay made of the second crop of grass frequently produced it, and that selling horses on red clover, when the

grass had become a little too much ripened was sometimes instrumental in producing the same effect. Lorain's Husbandry contains several passages implying that the second crop of clover was a well known cause of Pylalism in his vicinity. The probability is that there are several sorts of vegetable poisons, which produce the same or similar effects in horses; and that to attribute the slobbering of horses *exclusively* to any one of the causes assigned for it is erroneous.

Proceedings of the Massachusetts Horticultural Society, at a meeting held at the Hall of the Institution, on Saturday, Oct. 8, 1831.

The President made the following report.

Since the last meeting of the Society, letters have been transmitted to Doct. Van Mons, of Lovain, in Belgium, announcing our grateful acknowledgments for the scions of his choice collection of pears, and the portion of his valuable Pomographic Belgique Moderne, which he so kindly presented, and requesting that he would do us the favor of sending duplicates of the former, and of such other new varieties, as were considered acquisitions by the amateurs and cultivators of Europe. He was assured that his very acceptable favors should be reciprocated and that a package of scions of our native fruits would be forwarded to him next February.

Letters have also been written to La Vicomte Hericort De Thury, President of the Hor. Soc. of Paris, the Chevalier Soutange Bodin, founder of the celebrated Garden of Fromont, G. C. Barnet, Esq. Consul of the U. S. in Paris, and Col. Thomas Aspinwall, Consul in London, on subjects relative to Horticulture, and especially desiring plans and descriptions of some of the most celebrated Gardens of Experiment and Rural Cemeteries, in France and Great Britain.

Letters have been received from Henry Piddington, Esq. Foreign Secretary of the Agricultural and Horticultural Society of India, James Ombrosi, Esq. Consul of the U. S. in Florence, and Doct. J. S. Rogers of Hartford, with a box of Black Hautbois Strawberry plants. As the latter arrived last Monday they have been set out, lest they should perish, and will be distributed, next season, among the members.

Respectfully submitted by

H. A. S. DEARBORN,

Calcutta, March 1, 1831.

To the Secretary of the Agricultural and Hort. Society of Boston.

SIR—The Agricultural and Horticultural Society of India have directed me to request your kind attention to the present circular.

The Society are convinced that the freest possible exchange of the natural productions of every country will be found in the end most conducive to the prosperity of all, and guided by these principles, they desire to offer both to societies and individuals in every quarter of the globe any of the Agricultural and Horticultural products of India or any information relative thereto, which may be desired, in exchange for such as may be forwarded or communicated to them. It will be most gratifying to the Society, if you can point out to them any desiderata which can be supplied from India, or if you can by any means forward to them seeds, plants, useful communications or suggestions. The Society will feel much obliged by your giving every publicity in your power to this communication.

I am, Sir, yours, &c. HENRY PIDDINGTON,
Foreign Sec. Agr. and Hort. Soc. India.

Florence, 29th June, 1831.

HENRY A. S. DEARBORN, Esq.
Pres. of the Mass. Hort. Soc. Boston.

SIR—I have received the honor of your letters of the 12th August, 1829, and of the 6th of December last, in the former of which you informed me that I had been elected a corresponding member of the Massachusetts Horticultural Society, and transmitted to me at the same time the Charter, Constitution, By-laws, &c. of that Institution, and in the latter advised me that you transmitted to me its diploma.

I regret that my inability on subjects relating to rural economy will prevent me from giving your Society that useful information that they might expect; furthermore, the very insufficient patronage and encouragement bestowed on the art of Horticulture by the Tuscan government, and by the Tuscan nobility and gentry, cause that the great advantages of this country, which from the variety of its soil and from the softness of its climate, might render it the spot of the finest hortulan display, remain still in a great degree unimproved.

There are in Florence no conservatories of private individuals, except the garden of the Imperial Royal Academy of Georgofili, and the Botanical Garden, adjoining to the Boboli Garden, belonging to the Grand Duke. The fortunes of the nobility and gentry in Tuscany not being such as to enable them to a lavish expenditure on their grounds and gardens, and from their being inclined to expenditures of another kind.

The most remarkable plants we have in Tuscany are the different kinds of Olive trees, of mulberry trees, among which there is a new one with very broad leaves and shrubby, and also fruit trees of every kind, the most part of which from the Levant, and from the north, to wit, from Germany, and also forage plants, among which red trefoil is of the greatest usefulness with us.

Our implements do not present anything remarkable; our ploughs, and spades, being almost the same heavy ones made use of by the old Romans.

As to the cultivation of all sorts of kitchen herbs, as cabbages, salads, and the like, in the neighborhood of Florence, they are rather industrious, and they have them in a fine method. I will send your Society some seeds next winter, in order that they may reach you in the Spring.

The new trees introduced in Tuscany since a few years, are for the most part ornamental ones, the most part from America, as various kinds of ash-trees, maple trees, and oaks.

There are but a few persons in Tuscany who devote themselves to rural pursuits, and those few ones are not capable of holding a scientific correspondence. The best instructed gentleman is Doctor Anthony Taryoni Torretti, prof. of Chemistry in the Imperial Royal Lyceum, and professor of Botany and materia medica, of whom honorable mention must be made, and whose exertions are highly meritorious, though little helped and assisted by the liberality both of our Grand Duke, and of our Government. Should your Society want any information on any particular subject he will be very happy in giving it.

The most industrious Pépiniériste or nursery-gardener in Tuscany for ornamental trees is Mr Benca, a native of France, formerly gardener to Count Butlerin, a Russian; but he now chiefly imports the plants from Chambéry and from Turin, where is Mr Boudin.

As to the plants lately introduced in Tuscany,

it is not yet ascertained how they will succeed, the seeds having been lately imported from Egypt, to wit, various kinds of Acaecias, and of leguminous and graminaceous plants.

The best collections consist of different varieties of citrons, lemons and oranges, which Florence has abundance of. As to flowers we have all the Camellias, and the Tuscan nobility and gentry all have some plants, but their collections are very small and imperfect.

Our best work on agricultural subjects is the Agrarian Journal, published by Bousieux, to which a part is joined of the Acts of the Georgofili Society.

We have no new method on anything whatever, except on the bringing up of the silk worms, and on the manner of making or spinning Silk.

I will procure you in the month of September, the different kinds of seeds which I shall think most suitable for you.

Begging you to be with your Society the interpreter of my sentiments of gratitude for the high honor they have conferred on me, I remain very respectfully,

Sir, your most obedient servant,

JAMES OMBROSI,
U. S. Consul at Florence.

Hartford, Sept. 21, 1831.

MY DEAR SIR—I avail myself of the opportunity afforded by the return of my brother-in-law, Mr Bowdoin, to forward to you a small box containing a few strawberry plants of a kind which, with me, has proved very choice, both in regard to the quality of the fruit and the abundance in which it is yielded. The original stock was given to me, about eighteen months since, under the name of 'Black Hautbois,' and I have had this summer, an opportunity of comparing it with some other varieties which have been growing side by side, with it. In the same compartment of my garden with it, I have the common Hautbois, the Chili, the Pine Apple, the white Hautbois, the French Hautbois,—and I should give it the decided preference to either or all of them; it ripened about a week after the common Hautbois; continued to produce fruit for about six weeks; and although its quantity *numerically* was, perhaps rather less than that of the other, it was fully equal, if estimated by weight, as the berries are considerably larger. It is probable that its flavor might not be acceptable to all, as it is peculiar; differing from that of any other fruit with which I am acquainted; to me, however, it was very agreeable. I may also remark that the Black Hautbois suffered less from some very dry weather which we had while it was coming forward, than the other varieties which were near it.

I know not but that I am treading on ground which has been frequently passed over; but as this article is new to me, and as I found no one in this vicinity who knows it, I have ventured to send it, as at least an evidence of my desire to contribute my mite to the general stock of horticultural knowledge which is so largely indebted to the Massachusetts Society for its diffusion in this section of our country.

The 'Pine Apple strawberry,' which you were so good as to send me about two years since, I planted beside some plants which we have cultivated as the 'Chili'; we have given the same attention in every respect, to each, and I can find no difference either in the plants, or in the fruit, although I have compared them together at differ-

ent stages of their progress; they have both yielded me large fruit; I have taken several berries which measured 4 inches in circumference; one measured 4½ inches. May I ask you to inform me at your leisure, what distinction you notice between these two varieties, as growing with you?

It has been a matter of much regret, that I have not had it in my power to be more useful, hitherto, to the Society; circumstances have left my time since my removal to this place, much less under my control than I could have wished; I have, however, looked with great interest at the weekly report of your proceedings in the New England Farmer, and have only to hope that I may ere long have an opportunity to follow the example there exhibited by some of those gentlemen who are always foremost in the ranks, when any useful object is to be accomplished.

Have you yet received a very early and excellent potato known as the 'Van Schaick' potato? I have found it much the earliest we can procure: should you desire it, I will divide with you a bushel or two which remain for seed from a very small quantity planted for the first time a year from last spring. I am, my dear Sir,

Very respectfully and sincerely yours,

J. SMYTH ROGERS.

HON. H. A. S. DEARBORN.

Pres. of the Mass. Hort. Soc.

SIR—It is with sincere regret we announce to you the fate of the scions sent by Dr Van Mons to the Mass. Hort. Soc. and by their vote of the 27th of Aug. committed to our charge for recovery and preservation.

These scions consisted of 76 rare and highly valuable varieties of pears, of each sort a single twig; mostly quite new even to Europe, and especially so to America.

From the perfectly dry state in which they were received, they might unquestionably have been recovered, had they sustained no injuries from other causes; we cannot therefore ascribe their destruction to this cause alone, but rather from the black and discolored state of the bark, and even the wood itself, it evidently appeared that they had previously lost their vitality by the combined action of moisture and of heat, in a passage fatally protracted throughout the months of Summer.

But notwithstanding these unpropitious appearances, it was due to the confidence reposed in us by the Society, that the experiments should be fairly and faithfully tried with them. Accordingly after being sufficiently steeped in pure water and each being subdivided into suitable lengths they were every one of them carefully set in stocks of sizes similar to themselves, by those most certain modes of grafting exhibited to us by yourself from the volumes in the Library of the Society, and so highly approved and recommended by Dr Van Mons—modes which we had heretofore practised with such unvarying success. In the present instance however our endeavors and the resources of art proved unavailing—not one of them is living.

With the greatest respect,

Your most obedient servants.

ROBERT MANNING.

J. & F. WINSHIP.

WILLIAM KENRICK.

Boston, Sept. 21st, 1831.

GENERAL DEARBORN,

DEAR SIR—I am requested by my friends Messrs E. & I. Fairbanks, of St Johnsbur, Vt. to

present to you, for distribution to the members of the Horticultural Society, some plum stones, which are represented as being something superior to anything of the kind, large, rich, and about 4 inches in circumference, with small stones and thin skins, the color a mixture of orange and red. The tree from which these were taken produced fruit the fourth year after planting.

Respectfully, yours,
Saturday morning, Oct. 8.

J. R. NEWELL.

FRUITS EXHIBITED.

Apples.—By John Prince, Esq. of Roxbury, specimens of large red striped Apples, an excellent fruit.—By J. L. Hale, Esq. from Newburyport, (and some specimens of very pleasant apples, called the *Moody Apple*, originally brought to Newburyport by Capt. Moody, former name lost.—By Mr. Beacon, various specimens of Spice and other Apples from New York, whose names were lost, of good appearance and various good flavors.—An Apple was received of the second crop from the same tree from the present season, from Salisbury point, opposite Newburyport.

Pears.—By Mr. E. Crafts of Roxbury, one of the varieties sent by Mr. Knight to Hon. Mr. Lowell—the Tillington, of delicious flavor.—By Mr. Manning, Benne-d'Argenson, but its genuineness is doubted, for neither the fruit nor the tree can be distinguished from the *Passe Colmar*; also another pear bearing the name of 'Van Mons' but not perfectly ripe, from a tree imported from Europe by Mr. Shaw of New York.—By Dr. Shurtleiff, specimens of Spanish Boe Cretien, Moorfohl's Egg; also large green Pears, somewhat globular in shape, name lost.—By Capt. King of Medford, Rushmore's Bon Cretien and Crassanne.—By Mr. John Clapp of Reading, specimens of a large good pear, sometimes called, at the South, *Platt's Berganot*, original name unknown.—By T. B. Coolidge, Esq. of Boston, a beautiful specimen of the old St Michael, perfectly free from the last.—By Mr. John Abbot, (forwarded to the Society via Portland, Me.) specimens of the Fulton pear, which has been spoken of on former occasions; sweet, juicy, melting, and of delicious flavor. It was observed by one of the gentlemen of the committee, that to have this pear in full perfection, it should be gathered a little before its full maturity, and ripened in-doors. We have good authority for stating that this fruit is an excellent bearer; and we mention the circumstance in this place because we deem it a very important one in regard to any fruit.—By George Johnson, Esq. of Salem, a drawing of a new pear, called *Johnson's Seedling*, said, on good authority, to be very fine, and at his request the committee have renounced this fruit the FRANKLIN PEAR.

Grapes.—By Dr. Shurtleiff, a specimen of his fine seedling, which has been noticed in the reports of former meetings.—By E. Vose, Esq. of Dorchester, a beautiful specimen of the 'Gros Maroc,' very large oval berries, of a black color, and of good flavor; grew in open culture.—By Mr. Senior, from his vineyard in Roxbury, three fine bunches of Black Hamburg, one weighing 2 lbs.; of open culture. In behalf of the Committee on Fruits,

WM. KENRICK.

Note.—The following was omitted in the report of last week:—

By Messrs Winships, a specimen of Native Pears, from Col. J. Wilson of Deerfield, considered in that vicinity a fine fruit, but not quite melting enough to be classed with our best.

The Apples presented on last inst. which excited notice as being sweet in one part of the fruit and sour in the other, were from Mr Elias Taylor of Charlemont.

To CORRESPONDENTS.—The length of the accounts of the agricultural and horticultural shows this week, have obliged us to defer till next week, several valuable communications.

Brighton Nursery.

The Messrs WINSHIPS are now ready to execute orders for Fruit, Forest, and Ornamental Trees, Shrubs, &c, Isabella and other Grape Vines, among which are the Black Cape, 2 and 3 years old; SHEPARDIA TREES, strong and healthy plants, 2 feet high, at the reduced price of 50 cts. each, sure to do well, with common culture, being remarkable for their hardiness and beauty.

Any orders left with our Agent, J. B. RUSSELL, Publisher of the New England Farmer, will be promptly attended to.

Oct. 12.

Prime Winter Wheat.

Just received at J. B. Russell's Seed Store, No. 50½ North Market Street—

20 bushels prime Winter Wheat, raised near Lake Erie. This is a new variety, originally from the Black Sea, and weighs 64 lbs. to the bushel. A more particular description will be published in next week's Farmer. Oct. 12.

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c, &c, which he will dispose of at as low a rate as can be purchased in the city. [?] Watches repaired and warranted.

Oct. 1.

if

Grape Vines.

For sale by the Subscriber, at his Garden in Dorchester, several varieties of Grape Vines, Scotch Gooseberries, Althaus, and Forest Trees. Among the former are

Black Hamburg,	} 2 to 4 years old—have borne fruit the present year.
Oval Purple,	
Round Black,	
White Muscadine,	
White Chasselas,	
Constantia,	

Black and white Moscatel—one year old. The parent vines are represented to have borne clusters weighing 2½ lbs.

Barcelona, a beautiful fruit, one year old.

Polonoia, Procured for me by the Consul at Cadiz, and said to be the most valuable Grapes produced in Spain.

De Peta. Clarence, or No. 13, a valuable variety, and great bearer.

Isabella, } Native.
Catawba, }
Bland, }

With many other sorts. Orders for any quantity of the above will be promptly executed, on application by mail, or otherwise, at the Garden, or at 7½ Congress street.

Oct. 5. ZEBEDEE COOK, JR.

BRIGHTON MARKET—Monday, Oct. 10.

[Reported for the Chronicle and Patriot.]

At Market this day 1138 Beef Cattle, 693 Stores, 2710 Sheep, and 3132 Swine—(350 Swine were reported last week.) The storm prevented much business which probably would otherwise have been done.

Prices.—Beef Cattle.—We quote for prime 4 75 & 4 85, good, 4 40 & 4 50; thin, 2 75 & 3 75. Barrelling Cattle.—Not enough has yet been done to establish the price. The barrellers offer for No. 1, \$2 50, No. 2, \$3, Mess \$5 50, and appear to be determined not to advance. Some cattle were purchased at the above prices.

Working Oxen.—No sales noticed. *Stores*.—Not so many sold as usual—last week's prices were asked.

Cows and Calves.—Sales were effected at \$17, 20, 23 and 25.

Sheep.—Sales were effected for lots at \$1 75, 2, 2 25 and 2 50—some prime, port Wethers, at 2 67 and 2 84; a few Wethers at \$3—about 1000 unsold. We noticed a Wethering Wether, owned by Maj. Nye of Barre, Mass. purchased by Mr. T. W. Bennett for \$10.

Swine.—More were at market than probably were ever before known in one day—a few only were sold, and prices were reduced. A lot of old Barrows were taken at 4c. a lot at 4½c. and a lot of prime Shoats selected, two thirds Barrows, at 4½c.—very little done at retail.

Erratum.—In our last week's report for the price of the entire lot of 350 Swine, it should read 3½ instead of 2½ as published.

New York Cattle Market, Oct. 7.—At market this week, 1400 Beef Cattle, 3000 Sheep and Lambs. The market altogether has been very brisk. There has been a small falling off in the price of Beef—we quote this week at \$14 & 6 75. Sheep and Lambs hold to old prices, but sold very quick. Sheep \$2 a 5, Lambs \$2 a 3. Fat Hogs \$4. Cows and Calves—sales from \$20 a 35, and several first rate a 38 a 40—Daily Advertiser.

In the New York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

The following extracts are from a small pamphlet lately published by Lilly & Watt, and Carter & Bender, entitled

KNOWLEDGE FOR THE PEOPLE,

OR, THE PLAIN
WHY AND BECAUSE.

Why does water thrown on a brisk and flaming fire apparently increase the combustion?

Because the water is converted into steam, which expanding and mixing with the flame, causes it to spread out into a much larger volume than it otherwise would have occupied. — *Amul.*

Why are strong flames often seen at the chimney top of foundry furnaces?

Because the heat of the furnace is so great that the smoke burns on reaching the oxygen of the atmosphere.

Why will that part of the curtains of a room which has been exposed to the sun, be often faded, while those parts which have not been so exposed retain their original colors?

Because the oxygen which existed in a solid form in the dye of the curtains, will be rendered aeriform by the rays of the sun, and will go off in the state of oxygen gas.

Why are urns for hot water, tea-pots, coffee-pots, &c, made with wooden or ivory handles?

Because, if metal were used, it would conduct the heat so readily that the hand could not bear to touch them: whereas wood and ivory are non-conductors of heat.

Why does a gate in an iron railing shut loosely and easily in a cold day, and stick in a warm one?

Because, in the latter, there is a greater expansion of the gate and railing than of the earth on which they are placed.

Why will a vessel which has been filled to the tip with warm liquid, not be full when the liquid has cooled?

Because of the expansion of the fluid by heat. Hence some cunning dealers in liquids make their purchases in very cold weather, and their sales in warm weather.

Why is a glass stopper, sticking fast in the neck of a bottle, often released by surrounding the neck with a cloth taken out of hot water, or by immersing the bottle up to the neck?

Because the binding ring is thus heated and expanded sooner than the stopper, and so becomes slack or loose upon it.

Why does straw or flannel prevent the freezing of water in pipes during winter?

Because it is a slow conducting screen or covering, and thus prevents heat passing out of the pipe. By the same means the heat is retained in steam pipes.

Why have ice-houses double walls, and why do wine coolers consist of double vessels?

Because air fills the intervals between the walls or vessels: or in some cases the space is filled with straw, sawdust or charcoal, all which are non-conductors of heat.

Why have some houses double windows?

Because the air inclosed between the two windows greatly prevents the escape of heat which is produced within the house in winter. Thus, air is an imperfect conductor of heat. Houses which have double windows are likewise more quiet than others, from the air being also a bad conductor of sound.

Why is a decanter of cold water when brought into a warm room, speedily covered with dew?

Because the temperature of the decanter is lower than that of the air immediately around it. The dew may be wiped off again and again, but will be constantly reproduced till the temperatures are equal. Upon this principle, the most convenient sort of hygrometer, or instrument for measuring the quantity of vapor in the atmosphere, is constructed.

Why are porous vessels used for wine-coolers?

Because, being dipped in water, they imbibe a quantity of it, which gradually evaporates; and, as a part of the heat necessary to convert the water into vapor will be taken from a bottle of wine placed in it, the wine is considerable cooled.

Why does the breath or perspiration of animals (of horses in particular, after strong exertion) become strikingly visible in cold or damp weather?

Because the vapor (invisible while at a higher temperature) is thickly precipitated, by the air with which it is mixed being too cold to preserve it invisible.

Why is profuse perspiration so cooling to laboring men, and all evaporation productive of cold?

Because of the necessity of a large quantity of caloric being combined with fluids, to convert them into vapor or gas.

Why do persons take cold by sitting in wet clothes?

Because they suddenly lose a large portion of heat, which is carried off from the body by the evaporation of the water from the clothes.

Why, in hot countries, do persons continually throw water on curtains which then form the sides of apartments?

Because the evaporation of the water absorbs a vast deal of heat, and makes the apartments cool and refreshing.

Why are assembly-rooms ventilated?

Because of the motion produced by the changed weight of air, when heated. The air which is within the room becomes warmer than the external air, and the latter then presses in at every opening or crevice to displace the former.

Why does the sulphuric acid in fire bottles so often fail in igniting the match?

Because the acid is continually attracting moisture from the air, owing to the imperfect manner of closing the bottles.

The atmosphere never dark on a windy night.—Several years since, when travelling by night in the mail coach, in the depth of winter and during the absence of the moon, I was surprised to observe, that, though dense clouds covered every part of the horizon, and not a single star could be seen, yet the night was far from being dark and large objects near the road were easily discerned. On expressing my surprise to the driver, he replied, 'The wind is very high, and during a great many years that I have been upon the road, I never knew it to be dark on a windy night.' The observation was at that time new to me; but subsequent experience has convinced me that it was true.—*London's Magazine of Natural History.*

Different methods of improving in Knowledge.—There are five eminent means or methods, whereby the mind is improved in knowledge, and these are—observation, reading, instruction by lectures, conversation, and meditation; the last of which is in a more peculiar manner called study. Each of these five methods has its peculiar advantages, by which it materially assists the others, and its peculiar defects, which need to be supplied by the assistance of the rest. Reading maketh a full man, conference a ready man, and writing an exact man.

A sunflower was raised in Charleston, S. C. this season, the seeded part of which was a foot in diameter.

New England Farmer and Horticultural Journal.

This is a weekly paper devoted to agriculture, gardening, and rural economy; edited by THOMAS G. FESSENDEN, assisted by various agricultural writers, and by the observations of the best practical farmers in New England. It is printed in a quarto form, (paged) making a volume of 116 pages annually, to which a title page and index are furnished gratis. This journal has been published for nine years; during which time the most assiduous exertions have been made by the Editor to make it acceptable and useful to the farmer and the horticulturist. From the increasing number and respectability of its correspondents, and the means now at the command of the Editor, the Publisher feels a confidence in recommending it to the favorable notice of the public, as a journal with regard to whose future character they will not be disappointed. By a vote of the Board of Visitors of the Botanic Garden at Cambridge, the intelligent Curator of that establishment has been requested to make known, through the New England Farmer, the details and results of his experiments in various horticultural subjects—the choice of soil, and situation, with regard to various plants, &c.;—and by a vote of the Massachusetts Horticultural Society, all communications on horticultural subjects, addressed to the President, are to be published regularly in the New England Farmer, so that this journal will contain the complete Transactions of the Society.

By concentrating all these advantages, it is thought that the volumes of the New England Farmer will contain a large collection of useful facts and experiments connected with agriculture and its kindred branches of gardening, orcharding, &c., as to be found worthy a place in the Library of every farmer. A weekly report of the sales of the cattle at Brighton—the state of the markets, crops, &c.—and occasionally drawings of agricultural implements, &c., will be found in this journal.

The New England Farmer is published every Wednesday evening at the low price of \$3.00 per annum, from which a discount of 50 cents is made to those who pay in advance. It will not be sent to new subscribers at a distance without payment being made in advance.

For Gentlemen who procure five subscribers, and forward the payment for the same, will be allowed a sixth copy gratis. New subscribers can be furnished with the back numbers of the current volume.

Editors with whom we exchange, who may feel disposed to give this one or two insertions, will confer a favor that will be reciprocated with pleasure on any occasion.

Notice.

The subscriber wishes to procure a small quantity, say half a pint, of acorns from each species of oak growing in New England, with the specific, or where not known, the common name. It is desirable that they should be sent in by the 1st of November, with the contributor's name, as they are to be forwarded to the London Horticultural Society. Any reasonable expense with regard to the above will be cheerfully paid.

41

J. B. RUSSELL.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

VOL. X.

BOSTON, WEDNESDAY EVENING, OCTOBER 19, 1831.

NO. 11.

COMMUNICATIONS.

MR KNIGHT'S NEW PEARS.

MR FESSENDEN—Having been, through accidental circumstances, brought into correspondence with THOMAS ANDREW KNIGHT, Esquire, and having been intrusted by him, with the dispersion of certain new varieties of pears, I think it an incumbent duty to state to cultivators the results of my experience as to the value of these fruits, in our climate: I mean strictly the climate of Boston and its vicinity.

His No. 1. *The Capianmont*, of which he said nothing in praise, proves to be a healthy, vigorous tree, a great bearer, well adapted to our climate, of large size, and great beauty. It so closely resembles the old St Michael in texture and flavor, that it can hardly be distinguished from it. It supplies its place fully in situations where the St Michael has entirely failed for 15 years past. It ripens from Sept. to Nov.

No. 2. *Tillington*, is a large and noble fruit, of excellent quality. It is superior to any pear we have except the old French Pears, which are in a failing state in most gardens, out of our cities. It ripens from Sept. 15, to probably Nov. 15 in our climate. I have had some doubts, whether I (*not Mr Knight*) may not have confounded this pear with the *Urbaniste*. This can only be decided when the *Urbaniste* shall show fruit; at any rate it is a valuable accession to our fruits.

No. 3. *The Urbaniste*, if not mistaken for the *Tillington*, has never been tested by me.

No. 4. *Beurré d'Anjou*, is a great and profuse bearer. The pears are of large size, admirably adapted to the market; its flavor and texture are good, but it is very prone to rot at the core, but not more so than the *Jargonelle*. It is at maturity from Oct. 1 to Nov. 1 in our climate.

Nos. 5 and 6. *Napoleon* and *Marie Louise*, pears of excellent qualities, great bearers, and rich fruits, but I am constrained to say, that they show a disposition to shed their leaves prematurely, and I hesitate to say, that they will be successful permanently.

No. 7. *Forelle*. I doubt the value of this pear in our climate. It is disposed to disease. It has no very high reputation in Europe.

No. 8. *Colmar d'Hyver* (*Gloria* synonyme.) I have only seen some fine specimens from Mr Parsons' garden, as yet unripe. It is of first rate excellence in Europe.

No. 9. *Passé Colmar*. A most productive variety, well suited to our climate, the best pear I ever tasted in the month of December.

No. 10. *Hardenpont de Printemps*. (*Beurré Rance* synonyme.) This fruit produced two pears this season, of large size, but as it does not ripen till April, we cannot judge of it.

No. 11. *Sylvanche verte d'Hyver* or Winter *Sylvanche*, is one of the noblest pears, which I have ever seen, as to size, vigor, productiveness, and good qualities. It seems to be admirably adapted to our climate. These are all, of which I can speak from observation, except the *Duchesse d'Angoulême*. This is a large and vigorous pear, not yet ripe.

I thought these remarks due to those who are now about selecting their varieties. Present hopes may be disappointed, but this should not deter me from giving all the information in my power, and this information has been given with the caution, that such a question requires. There is no horticultural vexation (I speak from personal suffering) greater, than being deceived in fruits, over which we have anxiously watched for 7 or 8 years.

Roxbury, Oct. 6, 1831.

J. LOWELL.

P. S. On the whole we may say, that the anticipation from Mr Knight's present of new fruits has been more amply realized, than we had any right to expect, taking into consideration the uncertainties arising from difference of climate and culture. Mr Parsons has specimens of the *Bonne Malinoise*, and of the *Rousseluch*, and I have two pears of the *Wormsley Grange*; but as they are not ripe, and as the scions were received under great disadvantages, the labels having been detached, and we had only to conjecture the numbers from notches on the scions, which were nearly defaced, I would not hazard any opinion as to them. I shall, however, with a due sense of the importance to nursery men, and to private cultivators, who are after all the most important part of society, probably in the ratio of 1000 to 1, state distinctly, and without partiality or prejudice, my personal experience of the fruits *not yet tasted*. I owe it to my brother cultivators, to be very explicit on this subject, to guard them against the losses and vexations, which I have suffered for more than 30 years.

The following letter is from ELIME MARVIN, Esq. a very distinguished and intelligent farmer in the Western part of New York. Mr RUSSELL has received a few bushels of the *Black Sea Wheat*, described below, for sale. Its appearance certainly surpasses anything of the kind we have seen in New England, it is free from small grains, or foreseeds, and weighs 61 lbs. to the bushel. A quantity of the *Tea Wheat* is expected in a few weeks.

NEW VARIETIES OF WHEAT.

MR FESSENDEN—The celebrated *Tea Wheat*, mentioned in the *New England Farmer*, vol. vi. page 82, I procured in 1828. I have sowed it with good success ever since. This wheat is no doubt a valuable acquisition to our agriculturists, and ought to be an encouragement for every one to cultivate, for the benefit of others, every kind of seed which comes into his hands, whenever it is found to be valuable.

I have also a winter wheat brought to this country from the *Black Sea*, which I consider more important than the *Tea Wheat*, and as well suited to every soil and climate. In 1828 I had brought me about three pecks of this wheat. I selected for it a piece of ground which had been in crops about 20 years, and sowed it the middle of December. I had 25 bushels of wheat from this sowing. I sowed it four years in succession, on the same ground, without any failure in the crop. The wheat, like your *Tea Wheat*, is not injured, by sun or where other wheat is almost lost. It has a firm, hard straw which withstands our storms, and is not injured by the fly. The kernel is hard and firm, not subject to grow in the field from long fogs or rains. After several successful experiments in this

grain, I thought it might suit our New England soil and climate. Three years ago I sent a cask to John Humphreys, Esq. Derby, Ct. It did well; the next year a barrel to the Hon. Matthew Griswold, whose place is situated on Long Island Sound, 14 miles from New London; part of the same to R. E. Schlen, Esq. 12 miles up Connecticut River. This wheat has been cultivated in all those places, and, as I have heard a short time since, has far exceeded their expectations.

I prefer the *Tea Wheat* to any other I have ever seen for *family bread*, as it does not dry, after being baked, like the common wheat of this country and has a sweet, pleasant flavor; but it will not sell in our markets, only at a reduced price on account of the dark yellow shade of the flour.

The *Black Sea Wheat*, which has taken the name of *White Flint*, from the peculiar whiteness of the flower and the hardness of the shell which contains it, is dry and particularly calculated for sea bread, crackers, and all kind of pastry cooking, and, on account of its solidity, commands the first price in market, it being about 4 pounds heavier to the bushel than what is commonly called *Western* or *Ohio Wheat*.

As the great and benevolent cause of temperance ought to be in the heart of every good citizen, I wish all our New England farmers, instead of raising rye to drink, would benefit themselves by this kind of grain, which I can assure them from real experience they will find a superior article both at their own tables and in market.

I have about 7 acres of the *Black Sea Wheat* which is said by those who pretend to be judges to be the best in this region; all or the most of it I should like to have sown in New England. My friends in Ct. have sent to me for a further supply of seed.

The wheat from the *Black Sea* I consider the same kind of wheat as the *Tea Wheat*; one is spring, the other winter. Neither of them are what we call *bearded*, but have a few scattering beards not over an inch in length; neither of them is liable to smut; I have seen only a few stalks in wet places and that is not like the wheat of this country, but comes on soon after it blossoms and is blown off long before the grain is ripe. The winter wheat has a stiffer straw than the spring and stands better in heavy rains, winds, &c. &c.

I have invariably had a better crop of the winter wheat than the spring on the same strength of soil, but on the high lands or dividing ridges where they have from 3 to 5 feet of snow through the winter, the spring wheat is a better and more certain crop.

Near Lake Erie our snows are about the same as on the sea board, and land which will produce from 40 to 50 bushels of corn per acre will bring from 20 to 30 of the *Black Sea Wheat*, sown on the corn hills in December. I have sown this wheat on corn hills, wheat and pea stubble, but prefer corn hills.

I have tried sowing this wheat from the last of August to the first of June, but the best crops which I have had, or seen, were sown the last of December early sowing one bushel to the acre, late sowing 36 qts. If I sow early, I prefer the last of September, if I cannot put the wheat in at that time,

Horticulture.

Proceedings of the Massachusetts Horticultural Society, at a meeting held at the Hall of the Institution, on Saturday, Oct. 15, 1831.

Report made by the President.

When the communication from John S. Skinner, Esq. in relation to the Pinus Pinea, was read, at the meeting held on the 13th of August, I stated that I had a number of plants of that species of pine, which were produced from seeds, planted last spring, and that in the autumn they should be distributed among the members of the society.

As this valuable and beautiful tree is a native of the European shores of the Mediterranean, and has not endured the rigorous climate of the most northern nations of the eastern continent, I was doubtful whether it could be acclimated in New England: and having presented some of the plants to the Hon. John Lowell, with an intimation that they probably would require protection during the winter, he sent me the following letter.

Hon. H. A. S. DEARBORN.

DEAR SIR—I received your present of plants. The pinus pinea is no stranger to me, and yet I am happy to be able to make a second trial of them. I had some seeds so long ago as in the life of Professor Peck.—I raised two plants, and kept them in my green house three years. I then planted them out under shelter of other pines. They endured the first winter well. The second was fatal to them. But I have acquired much experience since. I think I could preserve them now.—I should keep them in winter in my green house, and plant them out every year early in April. When they had attained some solidity of wood, I should leave them out, mulching their roots, and surrounding the tops with branches of pines, and other evergreens. This is a new European discovery, which I have tested and found to be wonderfully efficacious. In two or three years this pine will be as hardy as any of our oaks.—There are facts on this subject which have passed under my own eye, which convince me that we may naturalize the plants of the Grecian Archipelago, of Japan, and Northern China, by the aid of evergreens. It is much better screen than wooden or other artificial covers.

I here recommend to those who have the Chinese class of Roses, the varieties of which are so numerous, or who have the Rhododendron ponticum, or any other semi-fertile plants, to try the effect of surrounding them, thickly, with branches of any of the pine family. I kept a Rhododendron ponticum, in perfect vigor, by protecting it by pine branches. So I did the fig, in a building, without fire heat. There is an inflexible power in the living principle of evergreen plants, the same, which protects themselves from the frost of the severest winters, and which equally enables them to afford the same protection to other plants. The philosophy of it is no exactly definable, but the fact is so, and it is with the fact, that all modern rational philosophy has any concern, or condescends to take any notice. We do not now trouble ourselves with what ought to be the effects of any excitement, but what are its effects on trial.

I am, dear sir, respectfully, yours,

J. LOWELL.

* I have no doubt, that even plants as young as yours could be preserved in a dry cellar, giving them water very sparingly.

Besides the pleasing intelligence, that it is probable we may naturalize the Stone Pine, by adopting the method described by Mr Lowell, we have the gratification of learning, that one of our most distinguished patrons of rural and intellectual cultivation, not only continues to prosecute experiments of horticulture, with characteristic zeal, but hastens to promulgate the results for the public good. For more than a quarter of a century he has eminently advanced the science of Farming and Gardening, by practical illustrations, wit-

in his own highly cultivated and embellished grounds, while the Agricultural Repository, New England Farmer, and many other periodical publications, have been rendered interesting and instructive, by his numerous, lucid and able communications. No man in the Commonwealth has done so much to encourage a taste for useful and ornamental tillage, both by precept and example. His laudable efforts to disseminate intelligence, have been ardent and unremitting, and their salutary influence will be felt, and gratefully remembered, by succeeding generations.

In confirmation of the justness of these remarks, I submit another letter from that meritorious gentleman, accompanied by the specimen of fruit he has so kindly presented.

Roxbury, Oct. 22.

DEAR SIR—I send you a Passe Colmar Pear, which Mr Parmentier was kind enough to send me with great care. It proves to be identical with Mr Knight's. This is gratifying, as hers came direct from Flanders, I presume.

Very respectfully, yours,

J. LOWELL.

P. S. I have understood that Mr Parmentier received his Pears from his brother at Englien.

The following letter has been received from Gen. Joshua Wingate, jr. of Portland, with the new variety of pears therein named, besides an apple from a garden of choice fruit which he established some years since in Bath, and now owned by J. Robinson, and a basket of fruit from the garden of the Hon. J. F. Wingate of that town.

Portland, Oct. 16th, 1831.

MY DEAR SIR—I shall send you by the Steamboat this evening, a few Pears which grew on the farm of Mr William McLaughlin of Scarborough, who informed me that a person in Oxford County, (whose name he believed was Robert Lamb,) many years since, raised a number of Pear trees from the seeds, all of which produced, as he understood, fruit of an inferior quality, with the exception of one tree—and from that seedling tree the scions, which were grafted on the trees of Mr McLaughlin were obtained, and from those engrafted trees, the Pears I have sent you were picked.

I will thank you to present some of these Pears to the Massachusetts Horticultural Society, for the purpose of ascertaining whether, in the opinion of the Society, this variety is worth being propagated. If they should give a favorable decision on this Pear, scions may be obtained the next spring from Mr McLaughlin.

The Pears were picked in the last week of September, and would have been, I have no doubt, much better, if they had remained on the trees some days longer.—Those I send you are a fair sample of the sizes and quality of the Pears, as selected from about two bushels.

Mr McLaughlin's trees were engrafted in 1826.

I am, with respect and esteem,

Your obedient servant,

J. WINGATE, JR.

Hon. H. A. S. DEARBORN,

Pres. of the Mass. Hort. Soc.

In consequence of the information, obtained by Mr Lowell, I have considered it most expedient, that the plants of the Pinus Pinea should be confined to the care of such members as possessed green houses, and have therefore, presented them to the gentlemen whose names are designated on the pots, in which they are contained, with the fullest confidence that thorough experiments will be made, to ascertain whether this pine can be successfully cultivated in this state. It is recommended that the plants be removed into larger pots, placing but one in each.

Respectfully submitted by

H. A. S. DEARBORN,
Pres. of the Mass. Hort. Soc.

Brinley Place, Roxbury,
Oct. 15, 1831.

I prepare the ground, and let it be until I think the wheat will not be up before spring. I then cast on the wheat and cover it with a harrow. I think this would be the best plan to pursue on the seaboard, but a little experience will decide the point.

It is well known that what is called good wheat land is a stiff clay soil. In such a soil I should prefer the Red Chaff to the Black Sea Wheat. In this section of country we have almost every variety of soil. In a single field, in passing through my wheat I observed it did well on light sandy soil loam, which suggested the idea to me that it would be a profitable crop in New England.

From my own experience and observation I think wheat and corn are much improved by getting the seed from their natural soil. There is a region of country about 20 miles south of us where they raise very little wheat from their own seed, but by getting seed every season from near the lake they have fine crops; and we have our corns much improved by sending to the State of Ohio where the soil is better for corn than our own.

If your farmers should find it for their advantage to grow wheat in preference to rye, and should find that the seed which I send does better than their own, with due notice I can furnish you in common seasons one month earlier than the present. We have now a good threshing machine in operation which will fit for market more than 100 bushels per day.

SHEEP KILLED BY WILD CHERRIES.

Norfolk County, Oct. 10, 1831.

MR ESSEXDEN—In your last paper I observed a notice of cattle and sheep being poisoned by eating wild cherry leaves. This is the first time I have ever heard of such a thing. I own a farm in N. Hampshire on which I have a considerable flock of valuable sheep, and on the same farm there are very many of the small wild red and black cherry tree stalks. My farmer is a very intelligent observing man, and I have never heard him mention the idea of the sheep or lambs eating the cherry leaves, but it is a fact that for several years I have lost very many sheep and particularly lambs before they were one year old, from some cause for which we could not account. It very probably may be from this cause. Your correspondent Mr Tully at Saybrook, and any others knowing the facts, would greatly oblige me and no doubt many other sheep owners by describing the appearances and marks of the efforts produced, and enable us to judge, if this is the cause of our loss. Yours, very truly, J. P.

OKRA.—Hibiscus esculentus.

MR RUSSELL—I send you a specimen of this plant, which I have cultivated the past season with good success. I planted the seed in a rich loamy soil mixed with a small proportion of sand, and as early in May as I thought the ground sufficiently warm for the seed to vegetate. The plants soon made their appearance, and grew thrifflily. Judge BURL mentions, in the present vol. of the N. E. Farmer, page 44, that they are liable to be attacked by the grub, but my plants all continued in a flourishing state, producing a succession of pods, which were fit for use from the first of August until the frost checked their growth.

I was gratified to find the Okra so highly recommended by the eminent horticulturist above referred to. As I find it easy of cultivation I shall give it more attention for the future.

Yours, &c. PHILIP P. SPALDING.
Chelmsford, Oct. 13, 1831.

Corresponding Members Admitted.—E. S. H. Leonard, M. D. Providence, R. I. Gen. Joshua Wingate, jr. Portland, Me.

FRUITS EXHIBITED.

The Fruit presented was uncommonly fine. The principal contributors were Mr Prince of Long Island, N. Y., J. Lowell, Esq., S. G. Perkins, Esq., and Gorham Parsons, Esq., in this vicinity.

Pears.—A pear from the garden of Dr Jackson, name unknown.—Long Rosewater, from W. Prince, Flushing, Long Island, not in eating.—St Germain, from the same.—Colmar Souverain, large and melting, of an excellent flavor, from the same. From R. Tooley, a pear, name unknown, not in eating.—From the same, Taring, a pear not in eating.—From the same, Martin Sec, a pear not in eating.—From E. M. Richards, Monsieur Jean.—From the same, Platt's Bergamot.—From E. Crafts, Marie Louise, melting and excellent.—From Mr J. Clapp, South Reading, a pear, not in eating.—From Mr E. Crafts, one of Mr Knight's varieties of pears.—From Mr E. M. Richards, Crassane, a choice pear, fine and melting.—From R. Manning, several of Platt's Bergamot.—From the same, Holland Green, Cox No. 25.—From S. G. Perkins, Esq., a pear, supposed to be the Winter Bergamot of Cox.—From the same, Beze de Casey, good.—From the same, Doyenne d'iver, a beautiful pear, and a good bearer.—From Mrs Parmentier, Brooklyn, N. Y., Passe Colmar, sent by Hon. J. Lowell, not in eating.—From the garden of Jonathan French, tree from J. Bloodgood, pear, name unknown, very fine.—From Gorham Parsons, Esq., Gloria, a pear not in eating.—From W. Prince, Ronville, (New Duhamel) or Martin Sire of Quintinye and Evelyn, Martin Sire or Ronville of the old Duhamel, and of Rozier, Miller and Forsyth, not in eating.

APPLES.—From S. G. Perkins, Esq., Nonsuch, large and fine.—From R. Manning, Wine Apple, Cox, No. 31, imported from Philadelphia, good.—From W. Prince, American Black Apple.—From the same, Gestrand, a German Apple.—From Philip P. Spalding, Seedling Apples; will keep till March; the tree a great bearer.

QUINCES.—From Mr W. Prince, small apple shaped Quince; Musk Quince; Portugal Quince; large French Quince; pear shaped Quince; Scarlet flowering Quince, and Black flowering Quince.

From Mr W. Prince, Fruits called SHADDOCKS.

GRAPES.—From Mr R. Manning, Isabella (Grapes, from the Garden of Mr Stephen Driver, jun. of Salem. The vine is 3 years old, and this season produced 206 bunches of Grapes, of large size and well ripened. It is trained to the side of a building, and has been pruned winter and summer like a foreign vine. The grapes were the finest that have been presented this year, very sweet, and of good flavor.—By Edward Sharp, Dorchester, seedling Grapes, fair and good.

FINE SWEET POTATOES, by Mr R. Tooley.

A new coffee pot has been invented in Paris, by which the coffee is made without evaporation, the lamp extinguishes itself as soon as the coffee is made, the water comes down on the coffee of its own accord, in a boiling state, which retains in the coffee the whole of its aroma; and in addition to this judging by the prints of the vessel, which we have seen, it makes a very handsome ornament.—*London Globe.*

Valuable Discovery.—We learn that a gentleman of this city has invented an improvement in the Fine Arts, by which the representations of portraits, miniatures, &c. are rendered more perfect and natural. This is effected by a process never before made use of, and by methods hitherto undiscovered in this or any other country. A patent for this invention, we understand, is about to be taken out; after which the public will have opportunities of inspecting specimens.—*ib.*

RAILROADS.

Albany and Buffalo—Boston and Ontario.—The project of a railroad to run parallel with the Erie Canal through its whole length, and on its very route appears to be seriously entertained in New York. The expense is estimated at \$7,000,000, for a single track. Notices are given of two applications to be made to the Legislature at its next session for acts of incorporation for this object, but it is supposed that the two sets of petitioners will unite in one act. The opinion is expressed in the newspapers that the stock would be immediately taken up. Wealthy capitalists are concerned in the applications.

We have heretofore said as much perhaps as becomes us, and more than was useful on the subject of a railroad from Boston to Lake Ontario. We do ardently desire that some wealthy, intelligent and patriotic gentleman of this good city and state, would take up this subject, and give it a careful examination. It does indeed appear to us that such a golden opportunity to increase and secure unbounded and permanent business, and a solid, and beneficial political influence was never before offered to an enterprising community; certainly it was never before rejected. What is it? No less than connecting Boston by an easier and shorter route than from Albany to Buffalo with all the lakes, harbors and rivers and other inland navigation that New York has access to by her canal (and proposes to have with new facilities, by a railroad,)—but also with the noble Lake Ontario, one of the chains, which neither of the above works can directly touch?

Is this nothing? Does not every argument in favor of constructing a railroad alongside of the Canal apply with tenfold force in favor of such a work from Boston to all the Lakes? The bare naming of this project alarmed the people of Buffalo and they sent forth their fears and their chagrin, all natural enough, in paragraphs signifying the difficulties and depreciating the advantages of it, and running down to the lowest degree, and grievously misrepresenting the *Willard Canal*. Their excitement has now taken a much more sensible and manly direction. They have held a meeting, resolved to apply as soon as may be for a charter for their railroad, and have issued a circular upon it, which we have not seen. The report of Mr Hayward on the Boston and Ontario Railroad contains a great deal of valuable and gratifying information. For our part we think that we could do nothing that would so attach the West to us, and induce the habit of acting with us on great political questions affecting the business and livelihood of the citizens of Boston, Massachusetts, and the whole North as to construct this Railway. Will our statesmen look at it? Mr Hayward has reconnoitred routes, and obtained accurate surveys as far as Lake Champlain. He estimates the whole expense of a single track at about \$3,600,000, and of a double one at about \$5,000,000.—*Mass. Journal.*

Delaware and Hudson Canal.—It appears that between the 5th and 24th of September, 70 vessels of different descriptions cleared at Rondout, loaded with Lackawanna coal, and bound on various destinations. 15 were bound to Providence, 3 to Portsmouth, 2 to Fall River, 2 to Salem, 1 to Newport, 1 to Bristol, 1 to New Haven, 1 to Portland, 1 to Boston, 1 to Haverhill, 1 to Plymouth, 5 to Albany, 3 to Hudson, 6 to Newburg, 4 to Athens, 1 to Manhattanville, 3 to Williamsburg, 1 to Troy, 1 to Yonkers, 1 to Greenwich, 1 to Fishkill, 1 to Poughkeepsie, and 14 to New York. One vessel carried 446 tons.

FACTORIES AT TROY, FALL RIVER, MS.

From a communication in the New York American Advocate, we compile the following information, respecting the factories at Troy, Ms. The river falls 12½ feet in 150 rods, forming 9 dams, with about 14 feet fall to each. This place is at the head of Mount Hope Bay, and near Taunton river. The harbor will admit any ships which plough the ocean.

COTTON FACTORIES.

	spindles	looms	hands	lbs. cotton.
Troy Man'g co.	3892	169	150	300,000
Pocasset man'g co.	2000	65	70	84,000
Bullington's factory	500	18	20	30,000
Hawes & co's do.	700	20	20	10,000
Classe & Luther's do.	1536	60	70	128,000
A. & J. Shove's do.	1500	46	50	100,000
D. J. Olney's do.	900	24	30	50,000
Massasoit do.	10,000	350	400	810,000
Fall River do.	3250	90	140	221,000
Dexter, Wh. & co. do.	600	30	25	44,000
T. Shove's do.	1000	31	26	52,500
Shove & Slade's do.	—	—	22	52,500
Annan company	5580	206	250	365,000

Total, 31,458 1011 1276 2,290,000

It is a safe calculation to estimate 4 yards of cloth from a pound of cotton, which would make 9,160,000 yards, amounting at an average of 10 cents, to \$916,000 00

Deduct cost of the cotton, 229,000 00
which leaves the sum of 687,000 00
produced to the country by the labor of 1276 operatives, aided by machinery.

In addition to the above, there are at the above village,—

S. Shove & Co's sateen factory, employing 150 hands, value of goods manufactured per year, \$195,000.

A. Robeson's print factory, where 16,800 yards are bleached and printed daily, employing 260 hands.

Fall River Iron Works company, manufacture 1000 tons of iron yearly.

O. S. Hawes & Co's machine shop, employs 30 hands.

Brayton, Slade & Co's machinists, employ 25 hands.

The water power which moves this quantity of machinery, rises in a pond, only 3 miles distant: most all the investments have been made within 6 or 7 years. The village contains about 5000 inhabitants—and 7 places of public worship. The hands employed in the factories are 318 females, who are represented as well dressed and well behaved.—*Roc. Dai. Jde.*

PATERSON, N. J.

It is stated this place is fast rising in wealth and manufacturing importance: all the dwellings in the village are full: the following new factories are now in progress or completed:

- 2 for cotton goods;
- 1 for cotton goods and making machinery;
- 1 for cotton goods and mill-wright work;
- 1 for woollen goods;
- 1 for gut buttons and other articles.

We should say that Paterson was in the full tide of successful experiment.—*ib.*

Niles' Register estimates that the various manufactures of Baltimore, create a value of \$5,000,000 per annum. One coach factory employs 80 persons.

'Cranberry day' is hereafter to be a festival at Barnstable, Ms. The Journal states that the town authorities had forbidden this valuable berry to be taken from the bogs on Sandy Neck, until ripe, and then pay a stipulated part to the town. Sept. 20, was the day appointed, and 300 men, women and children had a fine frolic. Wet weather has probably reduced the crop one half; but from 150 to 200 bushels were picked.

Communications.

EPIDEMIC IN HORSES.

Plymouth, Sept. 25, 1831.

T. G. FESSENDEN, Esq.

DEAR SIR—Having no opportunity to investigate the subject of the epidemic among horses, of which you desired me to give you an account, I addressed a letter to DR ARAD THOMPSON of Middleborough, to obtain the information you requested, and he has favored me with the inclosed reply.

I am, your humble servant,

JAMES THACHER.

Middleboro', Sept. 26, 1831.

SIR,—Yours of the 19th inst. asking information of the number of horses that have died (lately) in this town, the nature and cause of the disease, the remedies, the appearances on dissection, &c, was received on the 22d of the same. Permit me to premise that I am unacquainted with the anatomy of the horse, know nothing of the pulse in health or disease, and have never read a treatise on their diseases. It will be unnecessary for me after this acknowledgment to say that I am in no measure qualified, to write on the epidemic for the instruction of the public. In the few unconnected facts and remarks that I may make I shall not make any attempt at veterinary style. If I can present any facts or give any information, that will aid you in your reply to the Editor of the New England Farmer, I shall be highly gratified.

The disease commenced about the first of August last. The number, as near as I can ascertain, that have died may be estimated at 75. Fifty of this number may have died in the first three weeks. After that the cases became less frequent. No case has occurred that has come to my knowledge since last Monday, when one case after a short sickness proved fatal.

The number that have had the disease in a greater or less degree and recovered, may be estimated at 25. All ages from the sucking colt and upward have been equally subject to it and to its fatal effects. The duration of it was various. Some cases proved fatal within 12 hours after the indisposition was discovered, while others continued 4 days before the fatal termination.

Those that recovered generally improved before the third day.

I know some that recovered and have regained their health that were reduced very low, while others that lived through the severity of the disease, continued in a very poor and weak condition, and either died by exhaustion (the disease, probably continuing in a chronic form) or killed because their recovery to usefulness was deemed hopeless.

When the horse was first observed to be indisposed, he was dull and moping, the eye dull and heavy, ceased to eat, inattentive to surrounding objects, inapitude to motion, when driven or moving voluntarily disposed to gyrate in a greater or less circle. The same horse when driven or led by the bridle would continually incline to the right or left and the same horse always the same way. They all had an expression of suffering, pain, or uneasy sensation. Some frequently putting the nose to the side. Some, when first discovered to be sick, were down on the side and unable after to remain on the feet. All, as the disease progressed, remained down, and occasionally making, (or having spasmodically) violent mo-

tions with the legs, and some became, perhaps 24 hours before death, apparently wholly insensible to surrounding objects, some sooner or later delirious, while others seemed to possess all the operations of instinct until their last moments. The bowels in no case within the result of my inquiry presented indications, by the discharges or bloating, that they were diseased.

We might enter into speculations on the cold winter, the wet and hot summer, in talking of the remote cause.

Some peculiar state of the grass, may with much plausibility be ranked as a remote cause of the disease, for there has been no case in this town where the horse had been fed on dry hay &c.

It is a well established fact, that almost every horse, where the condition of the system was ascertained by the detraction of blood, that fed on grass, labored under a very inflammatory diathesis; because the blood of all, with very few exceptions, bore indubitable evidence of such diathesis.

The disease in my opinion is a local inflammation of a very high grade.

From what I have heard of the examinations after death of others, and seen myself, I am of the opinion, that the stomach is the part much the most frequently primarily attacked. Popular opinion, both in this and former epidemics, located the disease wholly in the head. It has been denominated the Blind Stagers. Many perhaps drew the inference from the name that the horse was blind. I saw several charged with blindness which on examination, proved not to be blind. I believe that blindness is not a distinguishing mark of the disease. I believe it takes place in no case until the very last stages of some fatal cases.

I have seen but two examined after death. The first was a horse 20 years of age, had been sick three days, had the throat cut, being in articulo mortis, immediately before the examination both lobes of the brain presented equal traces of inflammation. The minute arteries were injured, giving to the whole surface a very faint reddish tint. No adhesion appeared on its removal. On one of the lungs a surface five by three inches showed marks of inflammation. The maw was filled with grass partly digested, and coarse Indian meal undigested which had been eaten the day before the attack. The meal was two quarts. One half of the stomach appeared in a healthy state. The other half instead of presenting the natural rugae showed a smooth surface of a very dark pink color, inclining to chocolate. The intestines had a healthy appearance, excepting where they came in contact with the inflamed maw. The other viscera of the abdomen showed no marks of having been inflamed or diseased.

The other examination was of a horse 8 years old and had been sick nearly 4 days, and in a similar state of the other was bled to death. The brain presented the same appearance (with a less degree of inflammation) with the foregoing case. The lungs showed no evidence of having been inflamed. They had a few small spots of dark extravasated blood near the surface. The peritoneum exhibited no trace of disease. The inside of the stomach presented a smooth surface or wholly deprived of all the rugae and covered by a whitish, tenacious, mucous and pus like matter. On the removal of this, the mucous membrane was ulcerated in numerous small spots; and between the ulcerations, the mucous coat had a strong pink tint, and the small arteries evidently

injured, the other viscera showed no marks of having been diseased.

At the commencement of the epidemic, popular opinion making the head the sole part diseased, the practice was directed to that part, as steaming the head, filling the ears with various substances, and throwing into the stomach as many different articles and mixtures as the different individuals who advised them could imagine. The practice was wholly empirical.

It should be observed that the horse was bled two or at most three quarts. After the nature of the disease was supposed to be better understood, and the quantity of blood that the horse in inflammation required to lose, the detraction of blood became the principal remedy with the exhibition of some mild cathartic, as *Salts* or *Oil*.

Let it be admitted that the disease is one of a high grade of inflammation: to the physician the method of cure would be readily suggested. The practice would be *sanguinary*. Blood would be drawn, not by quarts, but by gallon upon gallon. In the early stages from three to four gallons should be drawn; if it is borne without fainting, the operation should be repeated according to the severity of the case, in 8, 12, or 18 hours. But admitting the stomach the part inflamed, and highly, and comparing it with that of man, in the same condition, great confidence of a complete removal of the inflammation cannot be placed in large detractions of blood from the large vessels alone. The stomach in man, is in some measure, so isolated from the vessels of the limbs &c, (or not to speculate,) when inflamed is not so readily cured, by large bleedings, as the lungs, for instance. In this case then, local detractions of blood, and local applications, over the part affected, as epistaxis after removing the hair, might be beneficial. The same remarks would I think apply to the bowels when inflamed. Admitting also that the mucous membrane, of the stomach or bowels, or both are inflamed, the judicious physician would not prescribe drastic cathartics. He would carefully avoid throwing upon an irritated or an inflamed surface of these organs an irritating substance. If laxatives are required they should be of the mildest kinds, mild mucilaginous liquids might be thrown into the stomach with advantage. But in case the disease has attacked other organs, as the brain, lungs, liver, plura or peritoneum, &c, and the mucous membrane, free, drastic cathartics might be exhibited with advantage. Before I made my examinations some unacquainted with the appearance of the organs in a diseased condition, made partial examinations, as of the head and thorax only, and gave very unsatisfactory accounts of the case. The mucous membrane of the stomach, &c, had not been examined. After my examinations others were made of the stomach, bowels, &c, and reported to exhibit the same appearance of the internal coats of the stomach as I have reported mine to present. The appearance of the stomach, in those cases that I examined, when compared with the state of the other organs, carried strong conviction to my mind that in these cases, this organ was primarily affected; and that this affection was inflammation of a high grade; in the first case wholly suspending all secretion and in the second, resulting in ulceration, &c. The state of the head in man in many fevers, where the mucous membrane of the stomach is inflamed might easily admit the inference to be drawn, in both cases, that the inflammation of the brain was

sympathetic. The pain, the delirium, the sudden and great prostration of strength, and even the sudden death in many cases, may be easily accounted for, admitting the stomach as much diseased as in the cases I saw examined.

But one horse died in this vicinity among the many kept. I attributed their greater exemption, to liberal and repeated bleedings, where the blood drawn showed a predisposition to disease, and repeated until the blood lost its marks of inflammatory diathesis. The indisposition to a *straight forward motion*, before mentioned, is to me wholly unaccountable. The inflammation, as well as I could judge, was equal in both lobes of the brain. No marks of congestion, more than is common to a slight degree of inflammation, on affusion and consequent compression, was discovered on either lobe. The horses that were sick and recovered, had the same disposition to grate as those that died. An explanation of the cause of this symptom, would afford me much satisfaction.

Some of the facts which I have stated, may, I hope, be useful in aiding others in arriving at a knowledge of the cause of the disease, and the best method of prevention and cure. The speculations, inferences from facts, remarks on the treatment, from me ignorant of the subject, you will I hope consider written more for my own amusement, than for your assistance in the investigation of the subject.

I have the satisfaction, on reflection, that of all of this communication, which is visionary and useless, you will readily know how to dispose; and also that if it contains but one fact that may be turned to the benefit of the public, you will duly appreciate it.

Had my business admitted I should have more promptly replied to your inquiries; and I cannot but regret that they had not been directed to some one more competent to have done justice to a subject in which the public are so much interested.

I am, sir, with great respect, yours,

ARAD THOMPSON.

N. B. Some perhaps might prefer the warm bath instead of the epispotis unless the inflammation was in a great measure previously removed.

THREE THORNED ACACIA.

MR FESSENDEN—A friend of mine in this vicinity, with myself are about to set hedges in the ensuing spring, of the Three Thorned Acacia and are anxious to know the most suitable distance at which the quicks should be placed. And a row of them being already in the place designed for a hedge, whether it would be preferable to transplant them, or to fill up a few vacancies and let them remain. They are from the seed last spring and from 18 inches to three feet in height, and one plant measures about 4 feet. Perhaps Judge BEEZ would be able and willing to furnish the requisite information, with such directions for the management as his experience may have suggested, and oblige a number of your readers.

Providence, Oct. 14

As we consider Three Thorned Acacia one of the most valuable plants for live fences in New England, being of vigorous growth and free from the attacks of any insect, we should feel obliged to Judge BEEZ or any other competent person who would furnish us with practical directions for the management of the plants from the seed till they are three years old in the hedge.—ED.

MIDDLESEX CATTLE SHOW.

The following is an official list of Premiums as communicated by the Committee.

MANUFACTURES.

To Mrs Hannah Adams, of Pepperell, for the best Carpet,	\$8 00
Mrs D. Richardson, Tyngsboro', next,	5 00
Naomi Kittridge, Tewksbury, next,	3 00

" " best Heifer, not having had a Calf,	6 00

Hezekiah Cheney, Concord, next,	4 00
Dexter Alden, Lincoln, best Heifer Calf,	5 00
Moody Moore, Waltham, next best,	3 00

WORKING OXEN.

Ichabod Stow, of Stow, for 5 year old Cattle,	12 00
Eli Rice, Marlboro', 4 year old "	10 00
Geo. M. Barrett, Concord, 5 do.	8 00
Jacob Baker, Lincoln, 6 year old,	6 00

SWINE.

John Mackay, Weston, best Boar,	8 00
" " best Breeding Sow,	8 00
" " Store Pigs,	6 00
Joseph Darby, Concord, 2d Store Pigs,	3 00
MILCH COWS.	
Levi Warren, Stow, best Milch Cow,	12 00
Geo. M. Barrett, Concord, 2d best,	10 00
Luther Conant, Acton, next best,	8 00
David Hartwell, Concord, 2 year old Milch Heifer,	8 00

LEATHER.

Peter Fletcher, Stow, best Calf Skins,	4 00
INVENTIONS AND IMPROVEMENTS.	
Alpheus Smith, of Lowell, for a superior Plough	2 00

John M. Hartwell, Littleton, for a superior specimen Pennmanship,	1 00
---	------

Moody Moore, Waltham, quantity of Sweet Potatoes,	2 00
---	------

Moses Abbot, Bedford, 4 large Crook-Necked Squashes,	1 00
John Dudley, Weston, 4 do.	1 00

Anthony Wright, Concord, quantity of Sweet Potatoes,	2 00
" " 4 bottles Castor Oil,	5 00

Joshua Stone, Framingham, for 2 large Squashes, 1 00
The Committee recommended to the Farmers of Middlesex, a very excellent cast-iron Plough, as in their opinion equal to any in use, presented by Joseph R. Newell, of Boston.

FRUIT.

Timothy Davis, Jr. of Billerica, fine specimen of Baldwin Apples,	1 00
Eli Howe, Marlboro', do.	1 00
Nathaniel S. Bennett, Framingham, Isabella Grapes,	1 00

FLOUGHING MATCH.

Ephraim Wheeler, Concord, 1st prem.	17 00
Isaac Brooks, Lincoln, 2d do.	10 00

Hezekiah Wetherbee, Concord, 2d Single Tomes,	7 00
---	------

Abel B. Heywood, Concord, 1st prem.	17 00
Henry A. Wheeler, " 2d "	10 00
Ichabod Stow, of Stow, 3d "	7 00

The exercises in the Meeting-house were unusually interesting; they consisted of—1. an Anthem; 2. Prayer by Rev. Mr. GOODWIN; 3. Hymn; 4. Address by JOHN M. CHENEY, Esq.; 5. Anthem.—Mr Goodwin's Prayer was appropriate, fervent and scriptural, and was listened to with devotional silence. Mr Cheney's Address was written in a clear and forcible style, and was replete with the best advice to those for whom it was prepared—the *Farmer and Mechanic*. A copy has been requested for the press, and we hope it will soon be in the hands of every one. Mr Shepard provided one of his best dinners for the Society, at which were present several gentlemen from the neighboring counties. The table was provided with the Black Hamburg Grape, by Hon. Mr. WINSHIP of Brighton, who was present; ELIAS PHINNEY, Esq. presented a rich repast of the Isabella and Catawba Grapes; Messrs WM. BECKMINSTER, and NATHANIEL S. BENNETT, of Framingham, also presented a fine lot of the Isabella Grapes.—*Yeoman's Gazette*.

BRISTOL AGRICULTURAL SOCIETY.

Officers chosen at the last meeting.—Roland Howard, President; Pitt Clark, Otis Thompson, Roland Green, and Francis Baijics, Vice Presidents; William A. F. Sproat, Recording Secretary; James L. Hodges, Corresponding Secretary; and Samuel L. Crocker, Treasurer. The Committees of the last year were for the most part re-chosen. Roland Howard, Esq. the President, was appointed to deliver the address at the next annual Show. We regret that we are still obliged to postpone the publication of Reports on the Best Cultivated Farms, Strawberry Trees, Live Stock, &c.

CATTLE SHOW.

The Annual Cattle Show for the District of Montreal took place on Thursday last, on the *St Jan's Common*. The horses, mares, horned cattle and sheep, were numerous, and many of them shewed that much attention is paid to the improvement of the breed of cattle throughout the district. The specimens of domestic manufactures were not so numerous as last year. We saw only four pieces of woollen, and two pieces of linen cloth; one of the latter was the best piece that we have seen of Lower Canada manufacture. We were much pleased with a very simple machine for lifting and carrying stones from arable land; we understand it has been tried by several farmers, who all speak favorably of it. We would feel much pleasure in noticing some of the most improved animals on the ground; but as the decision of the Judges will be laid before the public in a few days, in deference to their opinion we will await their announcement. We heard that a sample of hemp of Canadian growth was exhibited: this article will, we hope, meet with more attention in future: it cannot be doubted that, if properly cultivated, it would become a source of wealth to the country.—*Montreal Courant*.

Mount Vernon.—In a communication contained in the *Pennsylvania Inquirer*, it is said to be announced in the city of Washington that Gov. Cass, the present Secretary of War, has recommended the purchase, by government, of this distinguished seat, to be appropriated as an asylum for the few surviving soldiers of the revolution, and their families whose age and pecuniary circumstances render them dependent on public bounty, and whose past services and conduct entitle them to the support and gratitude of their country.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, OCT. 19, 1831.

EMPLOYMENT FOR FARMERS' EVENINGS.

There is no part of our time, which can be more profitably employed than the evenings of autumn and winter. In the evening every work for the next day whether for fine or rainy weather, should be arranged, as well as the proper minutes, accounts &c. of the preceding day duly recorded. Besides these, the farmer would do well to have a book for miscellaneous observations, queries, and calculations for comparing different ways of effecting the same objects—estimates of the different kinds of food, which he may be able to give to his cattle, with such inquiries, doubts, or propositions, worth attention, as he may have heard in conversation.

Loose pieces of paper are apt to be mislaid or lost, and when a man wishes to avail himself of them, for examining a subject previously discussed he loses more time in searching for the memorandums than would be sufficient for making half a dozen new ones. But by entering such matters into a book you preserve them for future consultation and use, and will be able to derive advantage from former ideas, which would otherwise escape from the most tenacious memory.

FARMERS' ACCOUNTS.

A celebrated agricultural writer says, 'There is not a single step in the life of a farmer that does not prove the advantage of his keeping regular accounts;' and yet there are very few who attend to this important branch of rural economy.

A few rough memoranda, often scrawled with chalk over the fire-place, or behind the door, are too often the only records which a farmer makes of his dealings either by way of barter or ready money; and he knows as little about his circumstances, and the amount of what he would be worth provided his debts were paid as he does about the Chinese language, or the most approved method of calculating eclipses.

The advantages resulting from clear and accurate accounts are properly appreciated in other pursuits in life, but it is doubtful whether they are greater in any occupation than in that of farming. Sir John Sinclair has given some maxims on this subject, which are in substance as follows.

GENERAL ACCOUNT OF STOCK.—Every farmer, who desires to know correctly to what profit he does business, should provide himself with a book, which he may call his *General Stock Book*, and in this, some time in December, he should register the result of a general survey of the condition and worth of his whole property including all his debts and credits. Having such a book to refer to at all times and on all occasions will afford much satisfaction to his mind. In the first place he should enter in all his tradesmen's bills, and in the meantime he may take an examination and account of all his household goods, horses, cattle, poultry, corn, grain, in straw or threshed, hay or other fodder, wood, manure, wagons, carts, ploughs, and implements of all kinds—the state of his fences, gates, drains, &c. and make an estimate of the necessary repairs. Minutes being made on waste paper, the particulars may be afterwards entered into the *Stock Book*, with such a degree of minuteness as may be judged necessary. After this general register, a Dr. and Cr. account may

be drawn out, the balance of which will exactly show the present worth of the estate.

The form of the amount may be as follows.

Stock Dr.

On the Dr. side should be entered all the farmer owes, and on the Cr. side all he possesses and all that is owing to him. He must write everything at what he judges the fair present worth, was it then sold; manure and tillage performed must be valued at the common rate of the country.

If a farmer wishes to be very correct in his calculations of the profit and loss of a lot of stalled oxen for instance, or the crop of any particular field, his readiest method is to make an account for either one or the other in his ledger of Dr. and Cr. On the Dr. side let him place the cost, including every minute particular, and on the Cr. side the returns. On the sale of the articles the account is closed, and the balance demonstrates the profit and loss.

Contra Cr.

Mr. Cheney's Address.—A gentleman who was present at the delivery of this Address, at the Concord Cattle Show, and who is well qualified to form a correct opinion of such performances, has assured us that it was of a high character, and was received with much approbation. We hope its publicity may be extended, and should be happy to give it a place in our columns.

Mr. Mackay's Breed of Swine.—It will be noticed in this day's paper, that Capt. Mackay has again taken a premium on his swine at Concord. We have had the curiosity to look over the files of the *New England Farmer*, and find that he has taken \$168 within the last six years, at the Shows in Brighton and Concord, in premiums on his invaluable breed of Swine. He has been indefatigable in procuring the finest animals from Europe, and by judicious crossing has produced a breed that we think are unrivalled for smallness of bone, fine flesh, lively condition, and kindly disposition to fatten easily and early.

From the Taunton Reporter.

SWEET POTATOES.

Letter from Doct. Deans of Easton, describing his manner of cultivating Carolina Potatoes, addressed to the Committee on Agriculture at the Cattle Show in this town last week.

GENTLEMEN—The slips, from which the Potatoes were grown, of which those herewith presented are a specimen, I obtained at Mr Russell's *New England Farmer Seed-store* in Boston, about the middle of April last, and directly placed them in a hot-bed for the purpose of sprouting; in the course of 12 or 14 days a part of them were sufficiently forward to be placed in the hill, the remainder were permitted to remain a week or ten days longer, before the sprouts were sufficiently grown to be removed. The place I selected for planting them, was a *light sandy loam*, too dry and barren for the ordinary purposes of cultivation. After ploughing, I proceeded to construct the hills, mixing in each about one half a common-sized wheel-barrow load of compost manure. The hills were made with an elevation of from 12 to 18 inches, with an average of something like three feet across the base, and flattened at the top sufficiently to admit the insertion of two slips from 8 to 10 inches apart. I prefer this method to the more common one of inserting them into the south side of the hill, as the tubers will more readily penetrate the body of the hill. I find, however they

rather incline towards the south side, invited, no doubt, by the greater warmth of that section of the hill.

From the result of this year's experiment, I am apt to think the hills need not be elevated so much as mine were, as it increases their liability to be affected with the drought; but as the past season has been unusually wet, I had but few hills that seemed to suffer from this source.

The growth of these potatoes I find are at first exceeding slow. It was as late as June before they all showed themselves above ground; but when they once 'get under way' they come forward very fast. Great care should be taken to keep the hills clear of weeds, for if permitted to take deep root, they not only impoverish the hill, but in pulling them up, we are apt to disturb the growth of the Potatoes. If from heavy rains, the earth should get washed away so much as to leave uncovered any part of the tubers, or the fibrous expansion of the roots, they should be carefully earthed, if the vines should not be so much extended as to render the thing impracticable.

In planting these potatoes, they should be but slightly covered, say from one to two inches, according to circumstances. If the weather should be dry, they should be imbedded so deep as to be surrounded by moist earth; and should the weather continue dry for some days after removing the slips from the hot-bed to the hills, care should be taken to see that they do not become so dry as to suspend vegetation; as in that case an additional covering of earth will become necessary.

Observing that the vine was apt to take root where the joint came into contiguity with the moist earth, from whence small tubers were grown, I thought to take advantage of this circumstance, by forming other hills from the vine. I accordingly put a handful of earth upon a few vines as soon as they became of sufficient length; and after the roots had entered the hill a few inches. I made two small hills and put a couple of these in each, and the vines directly shot forth in tolerable luxuriance. On opening the hills with a view of ascertaining the result of my experiment, I found tubers equal in size and goodness with those grown directly from the slips, as the Committee will perceive from the sample herewith presented. I intend another season to ascertain if possible, what advantage may be taken from this process under more favorable circumstances, and my researches I shall most likely make known to the Society at their next annual meeting. My researches the past season have been somewhat limited from want of experience; but it has in my own estimation, been sufficiently flattering to warrant another trial. I obtained from 5 hills, selected as being the best among 50, two bushels and a peck, of a size and quality such as are herewith exhibited, which I think but little if any inferior to those imported from the south.

For the information of those who may hereafter attempt raising this kind of Potatoes, without previous experience, I would suggest the propriety of dividing the slips on removing them from the hot bed, so that there shall not be more than two sprouts attached and then place two of these in a hill elevated about one foot from its base and if the soil be sterile, let it be richly supplied with well digested manure.

All which is respectfully submitted by, gentlemen, your most obedient servant,

SAMUEL DEANS.

FRUIT TREES.

For sale at the KENRICK NURSERIES, in NEWTON, near Boston, a most extensive assortment of Apples, Pears, Peaches, Plums, Cherries, Apricots, Nectarines, Almonds, Mulberries, Quinces, Raspberries, Gooseberry and Currant bushes, Grape Vines of the best foreign sorts, and 25 finest varieties of Strawberries, including the most rare, productive and esteemed.

Also about 400 varieties of the most hardy ornamental trees and shrubs, and superb hardy roses, including Silver Firs, varieties of Spruce, Flowering Horse Chestnuts, Flowering Catalpas, Mountain Ash with beautiful clusters of red berries in autumn and winter, Purple Acacia, Three Thorned and Thornless Acacia, Butternuts, Almonds of tree of Heaven, Elm, American and Scotch, Sugar Maples, Weeping Willows, &c. do. Napoleon from St Helena tree, Honey-suckles. Many of the above sorts of trees of extra sizes, for ornamenting highways and commons.

WHITE MULBERRIES, genuine sort for silk worms, by the 100 or 1000 for Plantations.

ISABELLA and CATAWBA Grape Vines, either singly or at reduced prices by the 100 or 1000.

CHINA ROSES, CHINESE CHRYSANTHEMUMS, GERANIUMS, &c. &c.

Written orders addressed either to JOHN or WILLIAM KENRICK, NEWTON, are regularly received by the daily mail, and will be promptly attended to, or they may if more convenient be left with J. B. Russell, at the New England Farmer office, where also, catalogues may be obtained gratis on application. But purchasers are invited when convenient to call and examine the trees, &c., for themselves, and make their own selections; but when this is not convenient, then let them forward their orders, relying that the very best possible selection will be made for them. Trees when destined for a distant place, are carefully packed either in clay or moss, and mats, and delivered whenever ordered in Boston free of any charge for transportation. Oct. 19.

Prime Winter Wheat.

Just received at J. B. Russell's Seed Store, No. 50, North Market Street—

A few bushels of the celebrated Black Sea Winter Wheat, described by Mr Marvin, in this week's New England Farmer, and raised by him near Lake Erie; price \$3 per bushel. It is thought this will prove a valuable acquisition to New England; the seed is of remarkably fine appearance, wholly free from small grain or mixture with other seeds, and we think cannot fail to give satisfaction. Farmers are requested to call and examine it. Oct. 19.

Pear Seedlings.

For sale at the Agricultural Warehouse, No. 52 North Market Street—

PEAR SEEDLINGS, of vigorous growth, and promising appearance, raised within six miles of Boston, in fine order for nurseries—the largest size are from 18 to 24 inches in length, the whole plant; price \$10 per thousand; the second size from 12 to 18 inches in length, price \$3 per thousand. They will be suitably packed as wanted, for transportation to any distance. Oct. 19.

Economical Oils.

SAMUEL DOWNER has for sale at his Oil Factory, at the head of Foster's wharf, (in the building lately occupied by John Trull, as a Distillery,) the following oils: Imitation Winter Sperm Oil, made expressly and only for the Argand or Circular Wick Lamp, burns well, is free from crust, and will stand the cold as well, or better, than winter strained sperm.

Imitation Summer Oil, burns well in any Lamp, and quite free from crust.

Double Refined Whale Oil, also burns well in any Lamp.

N. B. The above mentioned Oils will not in any manner injure Lamps, and should they not, on trial, give satisfaction, will be taken back and money returned.

Also for sale—Olive Oil, 1st and 2d quality. Neats Foot, do. do. Gas Oil, (so called) prepared from Alcohol and Spirits Turpentine. Single refined Whale Oil; Common, do. do.; and Fats, suitable for Yessels' Bottoms, or Soap Grease. It Oct. 19.

Farm Wanted.

Wanted to purchase, or hire, a good Farm within seven miles, south or west of Boston, containing forty to eighty acres of land, with genteel dwelling house, good barn, &c. Apply to J. B. Russell, Farmer office, Boston—if by letter, post paid. It Oct. 19.

Knowledge for the People.

This day published by Lilly & Wait, and Carter & Hendee, *Knowledge for the People, or the Plain Man's and Because*; familiarizing subjects of useful curiosity and amusing research.

Part I.—Domestic Science; containing upwards of 100 facts in Social Economy.

Part II.—Will consist of Zoology: Quadrupeds: illustrating their habits and peculiarities.

Part III.—Origins and Antiquities.

Part IV.—Zoology: Birds.

Part V.—Popular Chemistry.

Part VI.—Sports, Pastimes, and Superstitions.

Part VII.—Mechanics.

Part VIII.—Zoology: Amphibia, Insects, Reptiles and Worms.

Each Part to consist of 72 pages, to be continued monthly; price 12½ cents each.

To be followed by Man, which will occupy a distinct part. Phenomena of the Weather, Botany, Surface and Interior of the Earth. Discoveries and Inventions, Arts and Manufactures, Phenomena of Light, Heat, Sound, Electricity, and Magnetism.

Sold throughout the United States by all Agents for Library of Entertaining Knowledge. Oct. 12.

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c. &c., which he will dispose of at as low a rate as can be purchased in the city. Watches repaired and warranted. Oct. 4.

Grape Vines.

For sale by the Subscriber, at his Garden in Dorchester, several varieties of Grape Vines, Scotch Gooseberries, Altheas, and Forest Trees. Among the former are

Black Hamburg, Oval Purple, Round Black, 2 to 4 years old—have borne fruit the present year.

White Muscadine, White Chasselas, Constantia.

Black and white Moscatel—one year old. The patent vines are represented to have borne clusters weighing 36 lbs.

Barebna, a beautiful fruit, one year old.

Pomona, Procured for me by the Consul at Cadix, and said to be the most valuable Grapes produced in Spain.

De Peta.

Clarence, or No. 13, a valuable variety, and great bearer.

Isabelh, Native.

Catawba, Native.

Bland.

With many other sorts.

Orders for any quantity of the above will be promptly executed, on application by mail, or otherwise, at the Garden, or at 7½ Congress street.

Oct. 4. 5t ZEBEDEE COOK, JR.

Amunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. It Jan.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine *Medical Leech*. All orders will receive prompt attention.

EBENEZER WIGHT, 16, Milk street, opposite Federal-st., Apothecary. August 3. copf

Bulbous Flower Roots.

For sale by J. B. Russell, No. 52 North Market Street, Boston—

A few Double Crimson Penny Roots—50 cents each. Large white Lily Roots, extra size, 12½ cents each—\$1.00 per dozen. Hyacinths, Tulips, Narcissus, Iris, &c.

New England Farmer's Almanac for 1832.

Just published by J. B. Russell, at the office of the New England Farmer, 52, North Market Street, and Carter, Hendee & Babcock, Washington Street, the New England Farmer's Almanac, for 1832, by T. G. FESSENDEN, Editor of the New England Farmer—the Astronomical calculations by ROBERT T. PAINE, Esq.

Black Currant Wine.

Just received at J. B. Russell's Seed Store, No. 51 & 52 North Market Street, Boston—

A further supply of superior old Black Currant Wine, made under the inspection of John Pinney, Esq. Roxbury; an account of its astute and detergent properties in various complaints, will be found in the N. E. Farmer, vol. 5, page 267, written by S. W. Pomeroy, Esq. and the late Doct. J. G. Coffin. It is highly salutary in many summer complaints. Doct. Coffin states: 'Its use has been attended with remarkable success in the early stages of cholera morbus and dysentery—and again also in the later stages of these diseases, after the symptoms of inflammation or febrile excitement had ceased.' It has been strikingly remedial in the low states of typhoid and bilious fever. The late Capt. Gilchrist, who for several years followed the Batavia trade, and who had always suffered an attack of the severe cholera which proves so destructive of human life in that climate, used to say that after he had this wine with him, and took two glasses of it every morning, he escaped the disease. On one voyage, his mate, who had not taken the wine, was seized with this complaint, when a bottle or two stopped its progress. We have not room to enumerate many other most afflicting in which this wine has proved useful. In sore throat it has for many years been considered almost a specific remedy.—Price 75 cts. per bottle. Aug. 3.

Brighton Nursery.

The Messrs WINSTRIES are now ready to execute orders for Fruit, Forest, and Ornament Trees, Shrubs, &c., Isabella and other Grape Vines, among which are the Black Cape, 2 and 3 years old; SHEPARDIA TREES, strong and healthy plants, 2 feet high, at the reduced price of 50 cts. each, sure to do well, with common culture, being remarkable for their hardiness and beauty. Any orders left with our Agent, J. B. RUSSELL, Publisher of the New England Farmer, will be promptly attended to. Oct. 12.

BRIGHTON MARKET—Monday, Oct. 17.

[Reported for the Chronicle and Patriot.]

At Market this day 1071 Beef Cattle, 1633 Stores, 3739 Sheep, and 3193 Swine. A few Stores, about 200 Sheep and 1305 Swine were reported last week.

Prices.—*Beef Cattle*—Sales brisk and quite as good prices as last week were obtained; a few yoke extra were sold at about \$3.25, prime 4 1/2 a 5, good at 4 25 a 4 50, and thin at 2 75 a 3 75.

Barrelling Cattle.—The barrellers appear disposed to pay a trifle more; we quote for No. 2, 2 50, a 2 75; No. 1, 2 a 3 25; Mess 3 50 a 3 75.

Working Oxen—Sales were effected at 50, 57, 60, 62, 68, 75, 89 and \$85.

Stores—Sales of a large number were effected and many more will probably be sold tomorrow.

Cows and Calves.—We noticed sales at \$16, 17, 20½, 24, 24, 30 and 32.

Sheep.—Lots of store Sheep were taken at 1 25 a 1 50; lots to be slaughtered at \$1 75, 2, 2 12½, 2 25, 2 33, 2 50 and 2 75. Some wethers at about 3, and a few extra at 3 50 each.

Swine.—Considerable doing; one entire lot of 850 Shoats, half Barrows, were taken at 4c.; also one lot of 115 not half Barrows at 3½c.; also one entire lot of 120, half Barrows, at 4c.; one selected lot of 80, half Barrows, at 4½c.; two lots of old Barrows of about 20 each, at 4½c. Retail price, 4½ a 4½ for Sows, 5½ a 5½ for Barrows.

New York Cattle Market, Oct. 14.—At market this week, 900 head of Beef Cattle, which, on account of bad weather, although not as good a supply as last week, were rather dull sale; we however do not alter quotations, as last week's prices were fully sustained, \$4 a 6 75. Sheep and Lambs—there were about 3000 in, and notwithstanding the weather, sold quick at old prices: Sheep 2 a 3½; Lambs 2 a 3. Fat Hogs—market well supplied, and sales brisk at \$4; Cows and Calves are in demand, and sell quick at good prices.—*Daily Adver.*

In the New York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

'HARVEST HOME' IN ENGLAND.—The English papers speak highly of the crops in that country. Harvest had commenced unusually early, crops abundant, and the weather favorable for securing them.

MISCELLANY.

The following extracts are from a small pamphlet lately republished by Lilly & Wait, and Carter & Hendee, entitled

KNOWLEDGE FOR THE PEOPLE,

OR, THE PLAIN

WHY AND BECAUSE.

Why is lime most generally contained in natural waters?

Because there are few springs which, during some part of their subterranean course, do not come in contact with calcareous earth, and there is no substance which appears so readily soluble in a variety of menstria. The presence of lime uncombined in any natural waters, is, however, conjectural.

Why are ice and snow waters of superior purity?

Because they contain no gas or air, or saline substances, such having been expelled during freezing.

Why is the Thames water of such extreme softness?

Because, from observations at and below London bridge, as far up as Kew and Oxford, it is supposed that the waters seldom change, being probably carried up and down with the turn of the tides for an indefinite period of time.

Why are the objections to Thames water removed by filtration?

Because its impurities have no influence in permanently altering the quality of the water, which is good; and, as they are only suspended, mere rest, especially such as is given by filtration, will restore the water to its original purity.

Why are leaden cisterns unsafe for holding water for culinary purposes?

Because, if the water has stood in them for several days undisturbed, a small coating of white rust may be seen at the upper edge of the water. On every fresh addition of water this rust is washed off; and, if there be the slightest degree of acidity in the vessel, the rust of lead will be dissolved in the water, and thus an insidious poison will be conveyed into the stomach. This rust, or oxide, as it is chemically called, is produced by the lead combining with the oxygen of the water.

Why is ice broken before it is stored in wells?

Because it may retentive in the interior; in a long frost it diminishes considerably in bulk, as it forms itself into a compact mass, by freezing in the well.

Why should ice be taken from the sides of the well, and the centre left till the last?

Because, if the ice is first taken from the middle, you disturb the body, and the air thus introduced will destroy more than you consume.

Why does water boil in a vessel on the fire?

Because the parts of the liquid next the fire get heated, and rise up through the colder parts which are heavier; and this is found to be the principal manner of communicating heat to all parts of a liquid: for, if the heat is applied at the top, it can only with great difficulty be conducted through the liquid either sideways or downwards; but when applied below, the parts, as they are heated, become enlarged and lighter; they rise to the top, and heat the others in their progress, while those others, being still somewhat heavier, sink down, and are heated fully in their turn. By degrees, the whole liquid gets so hot that the parts next the bottom are converted into steam or vapor, which rises through the rest of the liquid in bubbles to the top, and there flies off till the whole liquid is evaporated.

Why should the bottom of a tea-kettle be black, and the top polished?

Because the bottom has to absorb heat, which is aided by rough and blackened surfaces; and the top has to retain heat, which is insured by polished ones.

Why is meat preserved by drying?

Because all bodies, to ferment, must be more or less moist. Thus, a piece of meat, with all its natural juices, will soon putrefy; whereas bodies completely dry cannot be made to undergo any kind of fermentation.

Why is habitual drinking especially fatal to the interests of cooks?

Because nothing so soon destroys the palate or taste, which is necessary even for the most experienced cooks, to ascertain the flavor and seasoning of their soups, sauces, &c.

Why does charcoal prevent meat, &c. becoming tainted?

Because it absorbs the different gases of putrefaction, and condenses them in its pores, without any alteration of their properties or its own.

Why is baking of all meats the least advantageous of cookery?

Because meat thus dressed loses about one third of its weight, and the nourishing juices are then, in great measure, dried up. Beef in boiling loses 26 lbs. in 100 lbs.; in roasting it loses nearly one third.

Why is beer believed to be of the same antiquity with wine?

Because the word beer seems to be of Hebrew origin; thus, the Hebrew for corn, with a very slight modification, sounds like beer in sabre, or ber. The Hebrew language modified itself into the Phœnician, and that again into the Saxon; accordingly the Saxon *biere*, barley, resembles its Hebrew parent; hence we have the English *beer*, the French *biere*, and the Italian *birra*. The Saxon word has been retained in English; for there is a kind of barley called *beer*, or *bigge*. The English word *beer* was, a few centuries ago, spelt *bere*; and beer has at all times been made from barley; hops are a modern improvement. We may therefore incline to believe, that the etymology of the word not only proves the remote antiquity of the beverage, but traces the invention to the family of Noah.

Why is the month of October an unfit time for brewing, although famous for the manufacture of English beer?

Because in October river water is generally unfit for use, it being then loaded with vegetable decompositions and living animalcules, neither of which are favorable to the fermentation.

Why does the water of stagnant ponds produce better beer than that of the finest springs?

Because, probably, of its softness, whilst its impurities are separated in the course of the fermentation.—*Nyman.*

Father and Son-in-law.—“Be easy,” said a rich invalid to his son-in-law, who was every hour perplexing him with complaints of his wife’s misbehavior. “Be easy, I say; as her behaviour is so very blameable, I will alter my will, and cut her off with a shilling.” The old man heard no more of his daughter’s failings.

Silver Mines.—It is reported that valuable silver ore has been, within a few days, discovered in great quantities in the county of Schoharie.—*Albany press.*

Silver ore has lately been obtained from a vein at Lubeo, Me. which is said to yield 140 ounces to the ton.

New England Farmer and Horticultural Journal.

This is a weekly paper devoted to agriculture, gardening, and rural economy; edited by THOMAS G. FESSENDEN, assisted by various agricultural writers, and by the observations of the best practical farmers in New England. It is printed in a quarto form, (paged) making a volume of 416 pages annually, to which a title page and index are furnished gratis. This journal has been published for nine years; during which time the most assiduous exertions have been made by the Editor to make it acceptable and useful to the farmer and the horticulturist. From the increasing number and respectability of its correspondents, and the means now at the command of the Editor, the Publisher feels a confidence in recommending it to the favorable notice of the public, as a journal with regard to whose future character they will not be disappointed. By a vote of the Board of Visitors of the Botanic Garden at Cambridge, the intelligent Curator of that establishment has been requested to make known, through the New England Farmer, the details and results of his experiments in various horticultural subjects—the choice of soil, and situation with regard to various plants, &c.—and by a vote of the Massachusetts Horticultural Society, all communications on horticultural subjects, addressed to the President, are to be published regularly in the New England Farmer, so that this journal will contain the complete Transactions of the Society.

By concentrating all these advantages, it is thought that the volumes of the New England Farmer will contain so large a collection of useful facts and experiments connected with agriculture and its kindred branches of gardening, orcharding, &c. as to be found worthy a place in the library of every farmer. A weekly report of the sales of the cattle at Brighton—the state of the markets, crops, &c.—and occasionally drawings of agricultural implements, &c., will be found in this journal.

The New England Farmer is published every Wednesday evening at the low price of \$3.00 per annum, from which a discount of 50 cents is made to those who pay in advance. It will not be sent to new subscribers at a distance without payment being made in advance.

Gentlemen who procure five subscribers, and forward the payment for the same, will be allowed a sixth copy gratis. New subscribers can be furnished with the back numbers of the current volume.

Persons with whom we exchange, who may feel disposed to give this one or two insertions, will confer a favor that will be reciprocated with pleasure on any occasion.

Notice.

The subscriber wishes to procure a small quantity, say half a pint, of acorns from each species of oak growing in New England, with the specific, or where not known, the common name. It is desirable that they should be sent in by the 1st of November, with the contributor’s name, as they are to be forwarded to the London Horticultural Society. Any reasonable expense with regard to the above will be cheerfully paid.

At

J. B. RUSSELL.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cents per volume, by leaving them at the Farmer office, Aug. 3.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

FOR THE NEW ENGLAND FARMER.

ICE HOUSES.

MR FESSENDEN—I have experienced much difficulty in keeping ice through the summer;—having tried for several years, but cannot keep it longer, than from the middle of July to the 1st of August. My ice house is built on a gravelly knoll and the soil in the vicinity is of a gravelly loam—the worst kind I apprehend, in which to locate an ice house. It is lined on the *out* side with clay and is covered with a shingled roof. The ice put into it has generally been of a good thickness and put in at a proper time. Why I have had no better success in preserving ice, I cannot tell, except it be the general character of the soil around it, which, as I observed, is *gravelly*.

As this is the season to build or repair ice houses for the approaching winter, I wish to inquire, through the medium of your paper, of those that are conversant with the subject and have had good success in keeping ice—What are the most approved methods of constructing ice houses, in general? What is the best kind of soil in which to build them? Is a wall of stone or brick or a wooden frame best for the body of the building? What size for a family of 8 or 10 persons? Is it best to have them entirely covered with earth, or with a shingled roof? Should it be nearly *air tight*, during the warm weather, or should there be a free circulation of air over the ice? What would be the effect of lining ice houses on the inside with powdered charcoal or coal dust?

An answer to any or all of these queries and any general remarks upon the subject of constructing ice houses and preserving ice, from any of your numerous correspondents would much benefit a constant reader of your useful periodical, from Franklin County, Mass. C.

By the Editor.—We should be happy to receive and publish information on the subject of the above communication from any persons who have a practical or theoretic knowledge of this important branch of economy. In the meantime we will offer some remarks, which may be worthy of some attention, though not the result of personal experience.

The whole art of preserving ice consists in guarding the ice house against the admission of heat. Heat is excluded from ice in a well constructed ice house, in the same manner, or by attention to the same principles by which animate bodies, vegetables, &c., are guarded against frost. The thing to be preserved, must in either case be surrounded by substances through which heat cannot pass. Those substances through which heat cannot pass, or through which it passes slowly are called non-conductors. Such are wool, fur, wood, &c. Substances, which transmit heat freely, such as the metals are called conductors of heat. The last mentioned, though heavy and apparently solid, permit heat to pass through them, like water through a riddle. If we wish to keep ice we should proceed to fence against external heat, in the same way that we would guard against

cold. Even air, which is capable of motion, and can have communication with the earth or atmosphere must be excluded from ice; for though air is not a conductor it is a carrier of heat. It will pick up particles of heat, say from the earth, or from water, or from anything else which is above its own temperature, and carry and deliver them to ice, or anything which is below its own temperature.

Mr Thomas Moore, of Montgomery County, Maryland, has written a treatise on this subject which gives the following directions for constructing an ice house.

The most favorable situation is a north hill side, near the top. On such a site open a pit twelve feet square at top, ten at bottom, and eight or nine feet deep. Logs may be laid round the top at the beginning, and the earth dug out raised behind them, so as to make a part of the pit. A drain should be made at one corner; the spout to carry off the water should descend from the pit, except a short space at the outward extremity, which ought to rise with a curve, so that the depressed part will always stand full of water, and prevent communication with external air. Dig holes in the bottom of the pit, and set therein four perpendicular corner posts, and an intermediate one on each side; let the inside of these posts form a square of eight feet in the middle of the pit. Then in order to avoid dampness from below, cover the bottom three or four inches with dry sand, if it can conveniently be got. The next thing to be done I consider as the most material, and also expensive part of the business; which is fixing a proper floor for the ice to rest on. In order to do this, let three or four sleepers, supported at their ends be placed across the square included by the posts, their upper edges about a foot from the bottom, but so that the plank laid thereon may have a descent of a few inches towards one of the sides next the drain. The plank should be two inches thick, and about half seasoned, jointed, grooved and tongued or lathed, and grooves cut near the joints in the upper side so as to prevent any water from going through. The floor must extend a little without the inner sides of the posts, so that the water, dripping from the sides, may fall on the floor. Then fix a plank or spout at the lower end of the floor, in such a manner as to convey the water into the drain. The floor being completed, begin at the bottom, and plank up on the insides of the posts with, 3-1 or 5-8 planks lapping the lower edge of each a little on the one below, so that the water may be kept on the inside; this done to the top of the post, (which should be even with the top of the pit) and the inside will be completed, except that it will be proper to cover the floor with loose plank previous to putting in the ice. The roof may be composed of any materials, and in any form that will defend the contents of the pit from wet, from the direct rays of the sun, and also admit a free circulation of air. I do not think any could answer the purpose better than one made of thatch, supported by posts a few feet from the ground.

The mode of filling the house remains now to be considered; and on this much depends.

Early in the winter fill the interstices between

the ice chamber and the bank with clean dry straw closely pressed; this being done early will prevent the earth from freezing, which would be injurious to the sides of the pit. The ice should be collected in the coldest weather; let it be exposed at least one night to the atmosphere after it is removed from the water, which will reduce its temperature many degrees, if the weather is severe. When put into the house, it should be beat small, and I think it would be useful frequently to sprinkle it with a watering pot whilst putting in, the mass would by that means be rendered more compact. When the chamber is filled, cover the whole with a good thickness of straw; but I suppose it would be best to cover the ice first with planks, supported by the sides of the chamber, only leaving a door to descend through.

Such a house as has been described, will contain about ten tons, and I am persuaded will be found sufficient to afford an ample supply for almost any private family.

This is nearly the kind I had in view when I estimated the expense would not exceed twenty dollars, and if we calculated on a great part of the work being done by the family, which in the country in general it very well may, the actual outlay in many places need not be five dollars. Those who are less sparing of expense, if they choose, may wall, or what is better plank up the sides of the pit, and finish the roof in a style of elegance.

In level situations, where a drain cannot be conveniently dug out from the bottom of the pit, I should suppose it would answer very well to inclose the ice by a mound raised entirely above the surface of the earth, through which the water may be discharged; in other respects to be similar to the foregoing description. This perhaps would not be quite so cool a repository as if under the surface of the earth; unless the mound was very thick; but I am persuaded that the loss of a very few degrees of temperature bears very little proportion to the advantage resulting from dryness.

If it were certain that the floor would be perfectly tight, the passage of heat to the ice would be rendered still more difficult by confining a quantity of dry ashes, saw dust, straw, or some other nonconductor between the floor and the bottom of the pit.

Willich's Domestic Encyclopedia says: A chimney to convey away the heated moist air is an essential requisite to all ice houses not much used, and which are placed in unfavorable situations. It is the want of this chimney, which occasions the disappointment of many persons, anxious to preserve ice in summer.

Loudon says (*Encyclopedia of Gardening*, page 390.) Ice is kept on the continent in cellars, at a greater or less depth from the surface according to the climate. These cellars are without windows, surrounded by very thick walls, and entered by double and treble doors, sometimes placed in angular or circuitous passages, and always with intervals of several feet between them. Sometimes precautions are taken to carry off any water which may arise from a partial thaw by forming gutters across the floor and covering it with a grating of

Agricultural.

BRISTOL AGRICULTURAL SOCIETY.

The Committee appointed to examine and consider the claims for premiums for the BEST CULTIVATED FARMS, offer the following Report:—

There was but one claimant, HENRY GARDNER, Esq. of Swainsry. On the 12th of July we examined his farm situated on Gardner's Neck, so called, lying between Cole's and Lee's rivers about two miles west in an air line from Fall River, having a full view of that village and the parts adjacent. The farm consists of 40 acres, of which 10 are mowing, 12 pasturage, 2½ orcharding, and the remaining 15½ tillage, including the buildings and appropriate yards. The farm is divided into small lots, nearly square, of three or four acres each, by strong stone walls, five feet in height on every side, except those lots which bound on the rivers. The public road running a southerly course on the height of land, divides the farm nearly in the centre, and a private road, part of which is walled on both sides, divides it into north and south compartments, leaving the lots on each side, which circumstance gives an easy access to any part of it. The soil is alluvial with a good proportion of sand and loam. About 300 loads of manure made of seaweed, besides fish and other matters from the stables are used on the farm annually.

The annual produce of the farm is about 15 tons of English hay, 100 bushels of Indian corn, 100 bushels of rye, 700 bushels of onions, 800 bushels of potatoes, 500 bushels of turnips, and cider, apples, pears, peaches and culinary vegetables in abundance for family use. The stock consists of 4 oxen, 2 cows, 4 young creatures, 1 horse, 20 sheep and 6 hogs. Four oxen are fattened yearly on grass, turnips and potatoes, producing about 4000 pounds of beef. The 6 hogs are fattened on meal, one third of rye and two thirds of Indian corn. This mode of fattening swine, Mr Gardner thinks is the best, the rye having a tendency to keep the bowels in a good state.—The six swine usually produce 1800 pounds of pork.

Mr Gardner has no particular mode of raising corn, but manures his ground designed for that article very highly. As to rye he observes some rotation of crops. He plants his potatoes early in the Spring, gathers them in the last of August or first of September; then immediately ploughs and sows the ground with rye. In July following the rye is reaped and the stubble turned in with the plough and turnip seed was sown on the top. In this manner, remembering always to keep the land highly manured, he raises about thirty bushels of rye to the acre, and from 200 to 300 bushels of turnips from the same acre and in the same year.

The orchard consists of good fruit trees, which are large, thrifty, well pruned, and so near together as to shade the ground in such a manner as that few weeds would grow. In fact such is the cultivation of this farm, that very few weeds were observed by the Committee. The barn is 21 by 56 feet and sufficiently high to hold thirty tons of hay. The barn yard is in front of the barn, a southern exposure. Adjoining the barn yard are the yard and sty for the swine.

The expenses of labor, &c, in cultivating his farm are about two hundred dollars annually.—

strong lattice work, leading to a cess-pool in the passage, whence the water can be taken out by utensils without opening the inner door; but very frequently full confidence is had in the coolness of the situation, especially if the surrounding soil be dry. Where the surrounding soil is moist, a frame work or cage of carpentry, grated at bottom, is constructed in the cellar, so as to be from one to two feet apart from the floor, sides and roof, and in this the ice is as perfectly preserved as in a dry soil. Ice is kept in the cellars of confectioners, and also by some of the market gardeners, in houses with a very thick covering of straw or reeds.

To keep ice in stacks or heaps in the open air, an elevated circular platform (a) is raised of earth; on this the ice is piled up in a conic form during a severe frost, and the addition of water enables the builder to form the cone very steep. On this cone wheat straw is laid a foot in thickness, (b) over this a stratum of fagot wood or spray (c) and finally another thick stratum of thatch or long litter of any sort (d). In this way ice will keep a year, care being taken to expose it to the air as short time as possible in obtaining supplies.

The form of ice houses, commonly adopted at country seats, both in Britain and France is generally that of an inverted cone, or rather hen's egg with the broad end uppermost.

The proper situation for an ice house is that of a dry spot of ground, as wherever there is moisture the ice will be liable to dissolve; of course in all strong soils, which retain the wet, too much care cannot be taken to make drains all round the house to carry off moisture. The situation should likewise be elevated, that there may be descent enough to convey off any wet that may arise near it, or from the ice melting.

Mammoth productions.—A gentleman, presented us, on Monday last, with a pair of Mammoth Radishes, which grew upon the premises of Mr JOHN CUCKELL, of Oxford township, in this county. One of which weighs five pounds and a quarter, and the other four pounds and a quarter. A small family might subsist on them for a month or two. For ourselves we can say, that Chester county cannot beat Mr Cuckell's radishes.—*Germantown Telegraph.*

Productive Squash Vine.—We are informed that Solon Whiting, Esq. of Lancaster, Mass. raised this season 228 lbs. of crooked necked Squashes from a single seed.

Large Potato.—A long red potato, raised the present season, by A. Otis, Jr. of Barnstable, weighed, after the dirt was washed off, three and three quarters pounds, exclusive of three lateral prongs, broken off in digging.

The amount of yearly produce, exclusive of supporting the family, is about 675 dollars, leaving a yearly profit of 475 dollars beyond the expenses.

Your Committee were highly gratified with the neatness, good cultivation and management of this farm; and although Mr Gardner had no competitor, yet the Committee recommend a premium of ten dollars and volume of the New England Farmer.

ROLAND GREEN,
ALFRED BAYLIES,
JACOB DEANE, } Committee.

From the Yeoman's Gazette.

MIDDLESEX AGRICULTURAL SOCIETY.

The Committee on Farms, Fruits and Forest Trees, respectfully make the following

REPORT:

In the month of September last, they proceeded to examine the several Farms, Orchards, &c, duly entered for Premiums, which were as hereafter mentioned.

FOREST TREES.

The only application for a premium for Forest Trees, was made by Mr JOHN B. CLARKE, of Concord, for his plantations of White Oaks,—His Oaks cover somewhat more than an acre of ground; were sown broadcast, and harrowed in, part in 1827, and part in 1829, but have not received that attention, necessary to give them a vigorous growth, being almost entirely covered with grass and herbage.

The Committee commend the object of Mr CLARKE in this experiment, but do not think him entitled to a premium.

ORCHARDS.

1. The Orchard of Mr NATHAN HUNT, Jr. of Concord. This Orchard contains about 120 trees; raised by himself, planted in 1819, grafted at the ground in 1821, and set out in 1826, 1828, 1830 and 1831. The Trees are set in rows one and a half rods apart. There has been nothing peculiar in the mode of cultivation. A little more attention to the trimming and shaping the trees your Committee think would add to their appearance and value.

2. The Orchard of Mr JAMES EUSTIS, of South Reading, contains barely Trees enough, in different parcels, to entitle him to a premium. Some of them look well but others evidently want attention.

3. The Orchard of Mr MARTIN HOW, of Marlboro', covers about two acres of ground and contains about 90 Trees; they were set in 1827, in rows, 30 feet apart; all engrafted in the nursery. The trees have not obtained a very large growth, but the Committee think, by a continuance of cultivation and a little more attention to pruning and shaping the tops, Mr How will make a very fine Orchard of it, in a few years.

4. The Orchard of Mr ROBERT CHAFFIN, of Acton. This Orchard covers two pieces of ground, one contains about two acres, on which are 114 Trees, and the other three fourths of an acre, on which are 34 Trees; the first were set in 1826, and the last in 1828. The trees are in rows, one and a half rods apart. Mr Chaffin's trees are thrifty, but the formation of their tops is very indifferently; whether owing to the species of fruit, or want of attention, the Committee are not able certainly to determine;—they are inclined, however, to think both these causes combined effect

this result. The Committee were sorry to find this defect, for it was apparent Mr Chaffin had spent considerable time in endeavoring to improve his Orchard.

5. The Orchard of Mr FRANCIS RICHARDSON, of Billerica, contains 131 Trees, covering about two and a half acres of strong soil. The trees were engrafted in the nursery, and were set out in 1825, in rows, two rods apart, at which time they were very small. The ground has been cultivated four years, at two different times, since they were set. They are remarkably thrifty and large, measuring on an average perhaps four inches in diameter. They have been very much improved by pruning the present year, and the tops now present a good form.

6. The Orchard of Mr MOSES SWEETSER, of South Reading, contains 95 fine Trees, set two rods apart and cover about two acres. They were engrafted in the nursery, and were set out in 1827. All the trees but nine are the Baldwin Apple. They have been skilfully trimmed, and of course the tops have a good formation.—They average about three inches in diameter and are remarkably thrifty. This Orchard presents a good model for the farmer to imitate, and we presume Mr Sweetser will charge nothing for the *patent*.

The Committee have the pleasure to be able to state that they have carefully examined each Orchard, they have before described, for the *bore*, but have found none, except in the Orchards of Messrs Sweetser and Eustis in South Reading, and there but few.

The Committee remark, generally, that the vast importance of constant cultivation, and of forming the tops by pruning, do not seem to be sufficiently appreciated. These points require the attention of every farmer, who is growing apple trees.—Trees should always be set at least two rods apart, in our opinion.

Upon a deliberate consideration of the claims of the several applicants, the Committee have unanimously agreed to award the 1st premium of \$15 to MOSES SWEETSER, of South Reading; the 2nd premium of \$12 to FRANCIS RICHARDSON, of Billerica; and not to award the 3d premium.

B. F. VARNUM, *Chairman*.

MERRIMACK AGRICULTURAL SOCIETY.

At the Annual Meeting of the Merrimack Agricultural Society, at Pembroke, on the 12th inst, the following gentlemen were chosen officers for the ensuing year, viz.

RICHARD BRADLEY, of Concord, *President*.
THOMAS D. MERRILL, of Epsom, *V. President*.
RICHARD GREENOUGH, of Canterbury, *Treasurer*.
JAMES WILSON, of Pembroke, *Secretary*.

BOARD OF DIRECTORS.—Joseph Low, *Concord*; Hall Burgin, *Milwauke*; John Ayers, *Canterbury*; James Blake, *Chichester*; Page Eaton, *Henriker*; Reuben Johnson, *Boscawen*.

From the record of proceedings we copy the following:

On motion of PHILIP CARRIGAIN, Esq.

Voted, That the Society are deeply impressed with the sudden and melancholy death of our late worthy member, ROBERT ANDROSE.

His spotless integrity, the amiableness of his disposition, and the active, liberal and useful virtues he displayed in the various relations of public and private life, made his person and character so much known, beloved and respected, that his sudden demise was not only sorely felt in the distressed circle of his immediate kindred and

friends, but extensively and deeply lamented and regretted.

Voted, That the foregoing resolution of this Society be communicated to his widow and parents, in testimony of our sincere sympathy with them, under this afflictive bereavement.

On motion of PHILIP CARRIGAIN, Esq.

Voted, That the Society are deeply impressed with the sudden death of our late worthy member, Dr EDWARD LERNED.

Having once ally and acceptably sustained the office of President of this Society, and since its organization having been always a zealous, persevering, and scientific promoter of its best interests, his loss will long be deplored by the Society; and from his skill as a Physician, urbanity of manners, and virtues as a citizen, by the community at large.

Voted, That this resolution of the Society be communicated to his widow and children, in testimony of our condolence with them, under this afflictive dispensation.

The next annual Meeting and Cattle Show will be held at Dunbarton.

PREMIUMS

Awarded by the Merrimack County Agricultural Society, 1831.

Olney Thompson, best farm, \$10 and one vol. of New England Farmer.

John Berry, next do. 8 and one vol. of New England Farmer.

Peter Bartlett, next do. 6 and one vol. of New England Farmer.

Nathan Ballard, jr. next do. 4 and one vol. of New England Farmer.

Charles Hutchins, 2d best Garden, one vol. of New England Farmer.

Joshua Laue, best corn, \$1 and one vol. New England Farmer.

Thomas Ames, best rye, one vol. New England Farmer.

do. do. best wheat, \$1 and one vol. of New England Farmer.

John West, Improvement on grass land, \$1 and one vol. of New England Farmer.

Charles Butters, best working oxen, \$5 00

David Ambrose, next do. 4 00

James Mann, next do. 3 00

John Pevely, next do. 2 00

James Mann, next do. 1 00

James Mann, best pr. 3 year old steers, 2 00

John Pevely, next do. 1 00

Benj. Simpson, best 2 year old, 1 00

James Mann, next do. 1 00

James Mann, 4 best yearlings, 2 00

James Mann, best bull, 3 00

James Pevely, next do. 2 00

Daniel K. Foster, best bull calf, 2 00

John Pevely, next do. 1 00

Olney Thompson, best milch cow, 3 00

Charles Hutchins, next do. 2 00

Olney Thompson, next do. 1 00

James Mann, best two year old heifer, 2 00

James Pevely, next do. 1 00

Warren Story, best breeding mare and colt, 3 00

Moses Chandler, next do. 2 00

Joseph Barnard, best Saxony Buck, 2 00

Stephen Sibley, next do. 3 00

Stephen Sibley, 10 best Saxony Ewes, 2 00

Joseph Barnard, 10 next do. 2 00

Benj. Simpson, best boar, 1 00

Aaron Whittemore, best sow, 2 00

do. do. 2 best pigs, 3 00

John Jarvis, best felled cloth, 3 00

Richard Bradley, best carpeting, 2 00

Hiram Brown, next do. 3 00

Caleb Reynolds, best hearth rug, 1 00

Miss Ann Emery, best blankets, 2 00

John Head, best linen, 2 00

Benj. Whipple, next best, 1 00

Stephen Chase, best sewing silk, 1 00

Mrs Nancy Dudley, straw bonnet, 1 00

Mrs B. Emerson, best cotton and wool coverlet, 1 50

Miss Asenath Mason, wool coverlet, 1 00

Miss Mary Kimball, counterpane, 1 50

Ruel Walker, calf skins, 1 00

Esra Allen, breaking up Plough, 2 00

Aaron Whittemore, Butter, 2 00

James Haseltine, Ploughing, 3 00

Benj. Simpson, do. 2 00

John G. Simpson, Ploughman, 1 00

John C. Kimball, Teamster, 1 00

Premiums recommended and ordered to be paid if the funds of the Society will permit.

William Gault, garden, 1 00

Richard Porter, on corn, 1 00

WHITE BEANS.

As this is a valuable production of the soil, and the time of harvest is approaching, a few suggestions as to the mode of harvesting, &c, may be of some consequence to the farmer.

As the small white Bean is the most saleable, and commands the best price in the market, care should be taken in harvesting that other kinds be not mixed therewith. Care should also be taken to keep the ripe separate from the unripe, as two bushels which are ripe and clean are worth more than the same quantity together with the addition of a bushel of unripe mixed with them.

It might be well (in harvesting) to divide the bushes or vines into three separate parcels. First—select such as are fully ripe. Secondly—those which are nearly ripe; and the third, embracing the remainder, together with the poorer part of the two first qualities, which might be separated in winnowing, and would be of some value to the sheep. By observing this or some better course, the farmer would find himself amply rewarded for the extra expense and trouble.—*Angusta Cour.*

Hogs.—We saw at Mr Edward Walker's establishment in this town, on Thursday a lot of nearly eighty of the largest and fattest hogs we have ever seen, weighing between three and four hundred lbs. each. It was with great difficulty some of them could move about. The same gentleman, we are told, killed a superior lot of hogs, about a hundred, last spring. He has also, now, a fine lot of about ninety store pigs.—*Bunker Hill Aurora.*

Hartford Agricultural Society.—A meeting of this efficient Society is advertised to be held this day for the choice of officers, and to consider a proposition for extending the benefits of the society, so as to embrace the best productions of Horticulture, including Orchards of Wild Mulberry and Fruit trees, Cotton and Woollen Manufactures and all branches of the Mechanic arts.

Turnips and Cabbages.—One of our subscribers Isaac Whitney, Esq. of Sherburne, has presented us with some cabbage heads of his own growing which measure 2 feet 10 inches in circumference and weigh 14 pounds each, exclusively of the loose, external leaves—and several large turnips, one of which, measures 2 feet 7½ inches in circumference.—*Boston Traveller.*

Wool.—The Imports of Wool into this city for the two first quarters of 1831, are 1,116,751 lbs. The Imports for the third quarter are estimated at 800,000. Total Import for nine months, 1,916,751 lbs.

The Journal des Connaissance Usuelles states that several persons in France have been nearly poisoned by the use of mouldy bread, and it adds also, that in some instances death has been produced by rancid bacon.

From the Delaware Journal.

LIME AND GREEN CROPS AS MANURE.

We were much gratified with a visit, on Tuesday last, to Woodside farm, the residence of S. Canby, Jr. situated in this neighborhood, between three and four miles from this borough. We spent about two hours in walking over the farm, and looking at the arrangements. The farm is between 150 and 190 acres, and under its present course of improvement, promises, in a short time, to be one of the most productive, as it is one of the most beautiful, in our State. The extensive farm-yard struck us as a model of utility and convenience—the capacity and general arrangement of the out-buildings, including the barn and sheds—the mode of dividing the horses and cattle into different yards, each of which is supplied with water by horse power, which is also applied to getting out the grain, wheat, corn, &c.—altogether constitutes the most complete farm-yard that we are acquainted with, and well deserving the inspection of farmers in this age of agricultural improvement. Mr Canby has directed his attention particularly to the rearing of a dairy stock, for which the character of his farm, which is finely watered, and has abundant meadow land, furnishes peculiar facilities. His stock is already considerable, and among them we saw some remarkably fine animals of the Teeswater or short horn Durham breed. Albeit, being unskilled in flocks and herds, we could not fail to notice and admire the features which distinguished this foreign species of the milky tribe from the native stock—the small head and neck, short horns, fine outlines, and magnificent udders, from whose beautiful source so many of our comforts and luxuries flow. In the course of our walk, Mr Canby pointed out three fields, one of which was then covered with a luxuriant crop of clover hay, that had just been cut. He stated that these fields, had, in the course of two years, been brought to the present flourishing condition, by the aid of lime and green manure alone. As it occurred to us that a knowledge of the method by which this effect is produced, would be useful to our farmers in those parts of the country where stable manure is not to be obtained, we here record the process adopted by him. In the autumn of 1818 he selected these three fields, which were worn out and exhausted by previous cropping. After ploughing, thirty bushels of lime were used to the acre, and the fields were sown with rye. Late in the succeeding May, the rye was ploughed in, thirty bushels of lime to the acre again spread on the land, and two bushels of corn sown broad cast. In the early part of September the corn was rolled down with a heavy roller and ploughed under, harrowed immediately after ploughing, sown with wheat early in October, and harrowed in. The crop of wheat, after this preparation, was nearly equal to that produced in the fields prepared with stable manure. One of these fields brought by this process from the lowest ebb of sterility, in the brief period of little more than two years, was, within our own view, as we have observed, covered with a heavy crop of grass just cut, and the other two furnished abundant pasture for all the stock of the farm! We should invite our agricultural friends in the middle and lower parts of the state, where stable manure is not accessible to all, to try this experiment. Let a farmer set apart, for this purpose, five or ten acres, if stone lime cannot be had,

shell lime probably can; use double the quantity of this. The expense, we are assured, is trifling, compared with the price of stable manure, even where it can be had, and that the expense will be paid by one or two crops.

From the American Journal of Geology.

THE ACCLIMATING PRINCIPLE OF PLANTS.

The valley of the Euphrates was doubtless the native region of all those fine and delicious fruits which enrich our orchards, and enter so largely into the luxury of living. We thence derived all the succulent and nutritious vegetables that go so far to support life; and even the farinaceous grains appertain to the same region. The cereal productions began in that same valley to be the staff of life.

Our corn, our fruit, our vegetables, our roots, and oil, have all travelled with man from Mesopotamia up to latitude 60°, and even farther, in favorable situations. The cares of man have made up for the want of climate, and his cultivation atoned for this alienation from their native spot. The Scandinavians of Europe, the Canadians of North America, and the Samoides of Asia, are now enjoying plants which care and cultivation have naturalized in their bleak climes. Melons and peaches, with many of the more tender plants and fruits, once almost tropical, have reached the 45th degree of latitude in perfection, and are found even in 50°. Rice has travelled from the tropics to 36°, and that of N. Carolina now promises to be better than that of more southern countries. The grape has reached 50°, and produces good wine and fruit in Hungary and Germany. The orange, lemon, and sugar-cane, strictly tropical, grow well in Florida, and up to 31½° in Louisiana, and the fruit of the former much larger and better than that under the equator.

Annual plants grown for roots, and vegetables, and grain, go still farther north in proportion, than the trees and shrubs, because their whole growth is matured in one summer; and we know that the development of vegetation is much quicker when spring does open in countries far to the north, than in the tropics. In Lapland and on Hudson's Bay, the full leaf is unfolded in one or two weeks, when spring begins, although it requires six or eight weeks in the south. Nature makes up in despatch for the want of length in her seasons, and this enables us to cultivate the annual plants very far to the north, in full perfection. The beans, pumpkins, potatoes, peas, cabbages, lettuce, celery, beets, turnips, and thousands of others, seem to disregard climate, and grow in any region or latitude where man plants and cherishes them. The fig is becoming common in France; the banana, pine-apple, and many other plants, have crossed the line of the tropics; and thousands of the plants valuable for food, clothing, and medicine, and such as are cultivated for their beauty, fragrance, or timber, are extending their climates, and promise much comfort and resource to man. Plants lately introduced, whose cultivation has not run through many ages or years, have acquired but little latitude in their growth, and show but little capacity to bear various climates, because time has not yet habituated them to such changes, and human cares have not imparted to them new habits and new powers.

From the Philadelphia Daily Chronicle.

HYACINTHS.

As among the amateurs of the Hyacinth, there are many who are ignorant of the care which is necessary for the cultivation of this plant, whether in the open air, or in the parlor, it will no doubt be acceptable to them to receive some instructions respecting the treatment necessary to be pursued, in order to bring this beautiful flower to perfection.

Of Hyacinths in the open air.—In this case the flower requires a dry soil, more or less sandy, in a bed which, during the winter is elevated a foot or a foot and a half. The bulbs should be placed in the ground during the month of September or October, at the depth of about five inches, and to preserve them from the cold, should be covered with the leaves of trees three inches in thickness; this covering should be removed in March, and replaced with a covering of old tan of the thickness of an inch, to preserve the bulb from frost.—After flowering, and when the leaves begin to grow yellow, the bulbs should be raised and preserved in a dry airy place until the following September or October, when they should be again planted.

On the cultivation of the Hyacinth in Parlors.—For this purpose China vases are to be preferred. The common earthen flower pot may also be used; but in this case the old are to be preferred to the new, as the small fragments which so easily detach themselves from the latter, are apt to injure the roots. The earth should be light and sandy, and the bulb buried in such a manner, that merely the point shall appear above the surface. The pot should then be planted in the open air, in some sunny spot, to the depth of three inches; then they should be covered to the depth of three inches with leaves, that they may be easily removed in case of severe cold. In November they should be removed to the house, and placed in a sunny spot; they should be a little watered, but so little, that the surface of the earth should be rather dry than moist; the water to be contained in a saucer, in which the pot should be placed.—Those who are afraid of injuring the vases, by burying them, should at least leave them in the open air as long as possible, observing strictly what has been said relative to the watering.

The best time to plant these bulbs is in September or October.

The Narcissus and Tulip require nearly the same treatment.

To succeed in the cultivation of the double Jonquil, it is necessary to plant them in pots, after they put out their roots and leaves in open air, and then to remove them to some airy and sunny place; the pots in a saucer, which should be always full of water, as this flower requires great humidity. The best time for planting the Jonquil is in August or September.

The frequent notices of the fine gooseberries grown in the garden of Isaac McKim, Esq. of this city, has caused numerous applications to us for the mode pursued in their culture. The following brief but comprehensive article, has been handed to us by Mr McKim, and clearly describes the method pursued in the successful cultivation of his gooseberries. There appears to be but one omission, and that was probably considered so palpably necessary as not to require special notice;—that is,

the selection of the best kinds of gooseberries for cultivation, without which all modes of culture must of course fail.—*American Farmer.*

ON THE PROPER CULTIVATION OF THE GOOSEBERRY.

When the plants are two years old take them up from the nursery and trim off all the suckers, and lower branches, leaving only one stem with a few branches at the top. Plant them in a rich light soil in a moist situation, and where they will be partially shaded by branches of trees. In the autumn, cover the ground around them with manure from the cow yard. The latter end of February thin out the branches very much, cutting them off close to the stem, taking out all such as cross each other, but be sure not to shorten the branches, for that causes them to throw out a great deal of wood and very little fruit. In the spring a quantity of young suckers will come up round the stem, all these must be cut off when green, as also any others that grow in the middle of the bush, which must be kept open so as to admit the air freely. It is also a great support to the bush to drive a stake into the ground close to the stem, as keeping it steady causes the fruit to be larger. This treatment is to be continued annually, and the fruit instead of depreciating as is usual, will rather improve in size, as has been proved by some planted 15 or 20 years ago. The ground must be spaded in the spring and kept perfectly clear of weeds.

From the Gooseberry Farmer.

DOMESTIC WINE.

Sir—I am gratified to find that the sample of wine I sent you was approved by yourself and friends—it was made as follows: The ripe grapes were picked from the stems and crushed, then measured, and the same quantity of water was added. The mixture was suffered to ferment in a cask, of which the head was taken out, for four days. It was then strained, and to the juice which was about 27 galls, was added 50 lbs. of Muscovado sugar, which was well stirred to dissolve it. The liquor was then put into a cask of 26 galls, which was kept constantly filled up to the bung; when the violence of the fermentation was over, the bung was put over the hole, but not driven in; some time afterwards it was stopped close, and so remained till the following March, when it was fined with white of eggs, and one gallon cogniac brandy was added. It was bottled off when 10 months old.

I am sir, your obdt. servt.

A GROVELAND FARMER.

A Malay sailor being at Mobile, some years since is said to have addressed some Choctaw Indians in his native tongue, that he held a long conversation with them, and declared there was no difference in language.—It is said in the Plymouth Memorial that he belonged to Brig Columbia, of Boston, the captain of which belonged to Cape Cod and told the story.

Count Leon and suite were lately at Erie, Pa. He wishes to obtain 100,000 acres in a body, and has had Rapp's settlement in view; but it is doubtful if he can find so much good land in a body there.

In 1786 the British Government paid the Landgrave of Hesse £471,000 for Hessian soldiers lost in the American war, at £30 a man: the number of Hessian lost must therefore have been 15,700.

THE PLEASURES OF A CANTER.

NAPOLÉON himself, whose resource under depression of spirits, and incipient indisposition, was to put himself on diet, and mount his horse for a fast ride, would not have refused his assent to the following description of the benefits and pleasures of a canter. Next to this, in efficacy, as a cure for the blues and vapors, for the host of imaginary diseases which are too oppressive for the poor hypochondriac to bear any longer, is—do not anticipate us, kind reader, we mean neither his drowning, nor marrying, nor any such venturous deed; the first being a mark of insanity, the latter of his *malice prepense* to injure another's peace of mind—our remedy we say is to toss the invalid into a stage-coach; and commend him to some friend in Pittsburg, St Louis, or Nashville, or any such decently remote part, so as to insure adequate jolting and attention to the safety of neck and limb, a forced look abroad at scenes as they present themselves, and some little efforts at civility, and a polite desire to please others, in order that the traveller may himself receive civility.

A canter is the cure for every evil, and brings the mind back to itself sooner than all the lessons of Chrysippus and Crantor. It is the only process that, at the same time, calms your feelings, and elevates your spirits, banishes blue devils, and raises you to the society of "angels ever bright and fair." It clears the mind; it cheers the heart. It is the best preparation for all enterprises, for it puts a man in good humor both with the world and himself; and whether you are going to make a speech or scribble a scene—whether you are about to conquer the world or yourself—order your horse. As you bound along, your wit will brighten, and your eloquence blaze, your courage grow more adamant, and your generous feelings burn with a livelier flame. And when the exercise is over, the excitement does not cease, as when it grows from music, for your blood is up, and the brilliancy of your eye is fed by your bubbling pulses. Then, my young friend, take my advice—rush into the world, and triumph will grow out of your quick life, like Victory bounding from the palm of Jove!—*Journal of Health.*

BEES.

The following extract from a Communication to the Bristol County Agricultural Society, shews the manner in which the writer has succeeded in excluding from his hives insects so often destructive to Bees.

'In the first place, I plant the posts of my beehive in troughs or gutters, filled with water to prevent insects from getting into the hives, and frequently strew fine salt at the mouth of the hives to prevent the worms from troubling the bees. I have kept bees for four or five years, and have never been troubled with any kind of insects.'

JACOB SHEPARD, Norton.

By the official census, just published at Washington, it appears that the whole number of inhabitants in the United States is 12,856,407, of which 10,526,368 are whites, 319,647 free colored, and 2,010,572 slaves. By the census of 1820, there were 7,856,269 whites, 233,100 free colored, and 1,531,436 slaves. The increase of whites has therefore been 2,670,099, or 34 per cent; of free colored 86,247, or 37 per cent; and of slave, 479,136 or 31 per cent. Total increase 3,218,276 or 32½ per cent.

RAIL ROADS.

Notice has been given that an application will be made to the Legislature of Vermont, now in session, for incorporating a company to make a rail road between Bennington and Brattleboro'. This is intended to be a continuation of, or connexion with a projected rail road from Troy to Bennington. Another application will be made to incorporate a company to build a rail road from Whitehall to Rutland. We hope to live long enough to see these works completed; and if we do, we shall see them connected (or in progress) with the rail road from Boston to Lowell. The distance, now travelled, through Lowell from Keene to Boston, is but 84 miles, 4 miles farther than the direct road through Groton and Concord. When rail roads are made, it will, through Lowell, be short of the present most direct route. We can then start at 6 in the morning, do business 4 hours in Boston, and reach home at 6 in the evening!—*Keene Sent.*

The Travel from Albany—Rail Road Statistics and Revenue.—The number of passengers, arriving and departing from Albany daily, is not only much greater than is generally supposed, but is increasing in a ratio nearly incredible. Those coming in and going out at a single point will illustrate this remark.

From the 10th to the 20th August, there were 1,986 1-2 passengers passed over the Mohawk and Hudson rail road, or an average of 180 1-2 per day.

From the 20th August to the 17th September, 4 weeks, the aggregate number of passengers on that road was 9029 or an average, daily, of 322½.

This is a revenue equal to \$58,766 25 per annum. The expenses of the road are estimated at \$10 per day, \$41,600 per annum. Leaving a net revenue on \$41,666 25 or nearly 15 per cent per annum, or \$300,000, for a single track. The passengers by the canal and turnpike are estimated to exceed the number now passing on the rail road; so that the actual number of passenger to and from Albany in one direction, may be estimated at not less than 600 per day.

The above returns, it will be perceived, do not include any part of the season of the influx at the Springs. Including that season, with the Saratoga rail road in operation (and that work is rapidly progressing), and with the general abandonment of other modes of travel and transportation, which may be expected when the rail road shall be completed from one city to the other; and the number that will pass on the road will average 800 per day.

The fact is not only a striking exhibit of the number of persons arriving and departing from this city, but of the great and increasing income of the rail road company.—*N. Y. Am. Advocate.*

Hudson and Mohawk Railroad.—It was the American and not the English locomotive, which went up the day before yesterday in thirty-eight minutes and returned in thirty-three. 'Brother Jonathan,' as yet, is decidedly in advance of 'John Bull.'—*Alb. Argus.*

Mr Jabez Reed, Wilton, N. Y. has raised from a single seed this season, 26 pumpkins weighing 486 lbs. most of them fit for use. There is a loud call for them from the neighborhood of Windsor, Vt. and Claremont, N. H. where they are at a loss how to keep Thanksgiving, from dearth of pumpkins.—*Patrol.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, OCT. 26, 1831.

WORCESTER CATTLE SHOW.

This Anniversary, we learn was celebrated with more than usual display on the 20th inst. Want of health prevented our attendance, (a circumstance which we regretted extremely) and we must therefore depend on report and 'Reports' for materials from which to fabricate our notice.

The Worcester Veoman contains the only account of this exhibition with which we have as yet been favored. According to that paper the collection of animals, as a whole, was not superior to what it has been in some former years. There was a falling off in fat Cattle, and other neat stock, except working oxen and steers. These improve in number and appearance, and in excellence of discipline from year to year; and are undoubtedly superior to any exhibition of the kind in the United States.

The manufactured articles, especially those of the household kind were apparently more numerous and of a better quality than on any former occasion, particularly the Carpets, Hearth Rugs, Veils, and smaller articles.

The collection of people was thought to be greater than on any former occasion. The exhibition was distinguished by the presence of a number of eminent men, among whom were the Hon. D. Webster, A. H. Everett, E. Everett, J. Welles, &c, who by their sentiments and compliments, in speeches and toasts, contributed much to the instruction and amusement of all who were present. Many of these attend, without doubt by invitation from Gov. Lincoln, who is President of the Agricultural Society, and always presides on these occasions with promptness and ability, and deserves their thanks for his successful exertions in furthering and advancing its objects, not only in the regularity and despatch of the business of the day, but in his attention and hospitality to guests, officers, committees &c, whom he entertained at his own house.

The Address by Hon. Oliver Fiske was well written, and interspersed with frequent passages of wit and humor. We hope we may be able to present it to our readers.

From the Gardener's Magazine.

ON RAISING AN EARLY CROP OF PEAS, AS PRACTISED IN A GARDEN AT CHICHESTER.

Str.—Mr Main's letter in vol. vi. page 555 has induced me to communicate my method for raising an early crop of peas, which I have practised for the last twelve years with perfect success, and which will I think, be found on trial decidedly superior both to Mr Main's mode, and to the old one of transplanting peas, so well known to the gardeners in the neighborhood of London. My method is this:

In the first or second week in November, I select six dozen pots of the 16 size, and fill them within 2 inches of the top with light rich mould. I then sow all over the surface with the early frame peas, but not so thick as to touch each other. I make a little better than a quart sow the whole. The pots are then filled up with the same mould, and placed in a cool frame orinery, protected from frost and mice. In the first week of March (in England) they will be about 6 inches high and the pots well filled with roots. Having made

choice of a warm spot on a south border, they are now transplanted by digging a hole sufficiently large to receive the contents of each pot; care being taken not to disturb the roots, but to preserve the balls entire. They are planted in rows 4 feet apart, and 2 feet in the rows, in the alternate manner or that which some gardeners term 'breaking the lines'. If the nights should prove frosty, I cover each tuft with a flower pot, and take it off every morning, which prevents them from receiving the least check. At the latter end of the month the pots are taken away, and the peas are stuck, each tuft separately, and inclining a little outwards at top to allow the plants plenty of room to spread. This method is quite applicable to all dwarf growing peas, which will never be found too thick: the air having a free circulation round each tuft, they begin bearing nearer the ground than those grown in the usual way and in parallel lines, and I find them bear much better. Peas are in general sown too thickly in the drills, and by that means they are drawn up so weak that they seldom produce any pods till arrived at their full growth, and then only near the top.

From the 1st to the 10th of May I generally gather my first dish of green peas; and I find the above number of pots will supply a family, upon an average, with three dishes of green peas per week, till the first or second week in June.

The advantage of this method will, I think, be obvious to your readers: by it the plants receive no check in the transplanting; whereas in the common practice of transplanting they receive a severe check, from which they do not recover in less than a fortnight, and which of course may be considered a fortnight lost at this season of the year; nor indeed can it be expected that they will ever grow so fine as when they receive no check. C. V. R.

Chichester, Jan. 1, 1831.

ANTHRACITE STOVE.

In Poulson's American Advertiser, favorable mention is made of a cheap Coal Stove, one of which was deposited by Mr Stemberger in the late Exhibition of the Franklin Institute in Philadelphia.

This apparatus consists of a furnace or cylinder of sheet iron with fire clay, a cast iron movable cover, a grate adapted to burning small or chestnut coal: Over the furnace may be placed, a large or small kettle for boiling clothes, or for cooking, or the cover may be put on, and it is then adapted to heating a kettle, flat-irons, or may be used as a grille for baking cakes.

An elbow joint of pipe connects the furnace with a sheet iron circular oven, through which the products of combustion pass, and from thence are conveyed to the chimney with any required length of pipe.—Some persons have objected to exposing the meat to the products of combustion, but it is believed by competent judges that meat thus cooked is better than when done or smothered in a close oven, and experience coincides with this opinion. The oven being perpetually heated is always ready for use, and is well adapted to warming the apartment.

One ton and a half of fine coal, costing \$4.50 will last six months, using it 11 hours each day, or less than three cents per day, or the fire may be kept in it during the night by covering it with ashes, at very little additional expense. The price of the stove, pipe, pans, &c, is \$6.50, and although designed for the use of the indigent, is well worthy the trial of all who study convenience and economy.

Not less than three cords of oak wood are re-

quired for six months, and being usually purchased in small quantities will cost \$21, leaving a clear saving by the use of coal of \$16.50 during a single winter.

We have seen one of the above named stoves at the store of Allen & Co, No. 72 State Street, and are much pleased with the simplicity, ingenuity and economy displayed in its construction.—Ed. N. E. Farmer.

Mammoth Productions.—Mr Philip P. Spalding of Cheshford, Ms. has sent to the office of the New England Farmer a watermelon weighing 37 lbs. and Mr Nathaniel Smith of Hopkinton, Mass. a sunflower measuring 11 inches in circumference; this last production was raised in St Lawrence Co. N. Y. where much attention is paid to its culture for the purpose of extracting oil from the seed. In the field where this was gathered, one stalk was noticed which measured 11 feet in height and 8½ inches in circumference at the ground. Sunflower oil answers very well for lamps and is much preferred to any other.

FRUITS EXHIBITED

At the Hall of the Massachusetts Horticultural Society, Saturday, Oct. 22, 1831.

By John Prince, Esq. Roxbury, *Bourré de Roi* Pears, they deservedly hold a very high rank among the choicest varieties.

By Mr Crafts, Napoleon Pears.

By Gen. Wingate, Portland, large *Russet Seedling* Pears, a very fine fruit, although it had been gathered rather too long. (See his letter in the last N. E. Farmer.) He also exhibited a handsome specimen of the *Monstrous Pippin*, raised by Mr J. D. Robinson, Bath, Me.

By Mr J. F. Wingate, Bath, good *St Michael* Pears, and a large fruit of the *Purple Egg plant*.

By Mr E. Vose, a basket, and one beautiful cluster of *Orange Quinces*, by far the finest variety cultivated in this vicinity, with which we are acquainted—also the *Portugal Quince*—also *Black Muscat*, and another variety of *Grapes* of very good quality.

By Mr D. Fosdick, Pound Pears and a good specimen of *Isabella Grapes*.

By Dr Shurtleff, a sample of Pears, name unknown.

By Mr Manning, handsome *Newtown Vergalieu* Pears, said to be native, raised from seed at Newtown, L. Island, great bearer, keeps till Dec. fine for baking and a middling good fruit for eating.

By Mr Nathaniel Seaver, Roxbury, a branch containing four clusters of good *Catawba Grapes*.

By Mr D. Gruffith, Portland, a specimen of *native* Pears, battery, but without much flavor.

By Mr John Howland, Jr. New Bedford, *Missouri* Grapes, they were thought to be very good *native* Grapes, but did not appear to good advantage on account of having been too long confined in a close box; some cuttings for distribution, would be very acceptable. In behalf of the Committee,

E. M. RICHARDS.

New Bedford, 10th mo. 17th, 1831.

SAMUEL DOWNER,

RESPECTED FRIEND—Agreeably to my promise, I send herewith some *Missouri* Grapes, which I regret are not in a better condition. As they are the first grown in this place, I have had so many tasters, that when I came to pick them there was not a perfect bunch among them. I do not consider them to be perfectly ripe, owing, as I suppose, to the situation of the vine; it being trained against the east wall of my garden, where it is deprived of the morning sun. They have however ripened better than some *Isabella* grapes, along side of them.

The vine is of vigorous growth, and I think promises to be as productive as the *Isabella*. Should they be considered by the committee on fruits, of the Horticultural Society, to be worth cultivating, I will forward some cuttings for distribution. Respectfully,

JOHN HOWLAND, JR.

Splendid Bulbous Roots.

Just received at the Agricultural Warehouse and Seed Store, No. 501 North Market-street, direct from Van Eeden & Co., Harlem, Holland, a large assortment of Bulbous Flower Roots, comprising the finest varieties of

HYACINTHUS—(double and single) dark blue, porcelain blue, red, rosy colored, pure white with yellow eye, white with rosy eye, and yellow with various eyes; from 12½ cts to \$100 each.

TULIPS—splendidly variegated, red, yellow and mixed, 12½ cts each \$1 per dozen, (our importation of fine tulips is very large, and we are enabled to put some sorts as low as \$6 per 100—an object to those who wish to form a superb tulip bed.)

CROWN LILIES—assorted, of the most splendid color, and showy flowers, large roots, 25 to 35 cts each, (extra fine roots).

JONQUILLES—sweet scented, finest roots 12½ cts each.

POLYANTHUS NARCISSUS—fragrant, white with citron cups, extra sized roots, 25 cts each.

DOUBLE NARCISSUS—fragrant, of all colors, 12½ cts each—per dozen, \$1.

SPRING CROCUS—of all colors, 6½ cts each, 50 cts per dozen.

PODOPHYLLUM PELTATUM—(a most singular production, fruit bearing and medicinal) 12½ cts each.

The above roots are from the same houses from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bells 1 inch and 8-10ths in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers.

Also, a further supply of Bulbous Roots, comprising Large White fragrant Lilies, 12½ cts each, 1 dollar per dozen, Tiger (spotted) Lilies, same price, Martagon or Turk's Cap Lilies, same price.

Cobb's Treatise on Silk.

Just published, and for sale at the Agricultural Warehouse and Seed Store, No. 501 North Market street,

A Manual, containing information respecting the Growth of the Mulberry Tree, with suitable Directions for the Culture of Silk—In three parts—with colored engravings. By J. H. COBB, A. M. Published by direction of His Excellency Gov. Lincoln, agreeably to a resolve of the Legislature of Massachusetts. Price 37½ cts. Oct. 26.

Gardener wants a Situation.

A man who served a regular apprenticeship in the garden of the Marquis of Waterford, Ireland, and can produce the best of recommendations, would have no objection to go into a family, this winter, to take care of the horses and other farmer's work, with which he is acquainted. Apply at this Office. Oct. 26.

Prime Winter Wheat.

Just received at J. B. Russell's Seed Store, No. 501 North Market Street—

A few bushels of the celebrated Black Sea Winter Wheat, described by Mr. Marvin, in this week's New England Farmer, and raised by him near Lake Erie; price \$3 per bushel. It is thought this will prove a valuable acquisition to New England; the seed is of remarkably fine appearance, wholly free from small grain or mixture with other seeds, and we think cannot fail to give satisfaction. Farmers are requested to call and examine it. Oct. 19.

Pear Seedlings.

For sale at the Agricultural Warehouse, No. 52 North Market Street—

PEAR SEEDLINGS, of vigorous growth, and promising appearance, raised within six miles of Boston, in fine order for nurseries—the largest size are from 18 to 24 inches in length, the whole plant; price \$10 per thousand; the second size from 12 to 18 inches in length, price \$5 per thousand. They will be suitably packed as wanted, for transportation to any distance. Oct. 19.

Brighton Nursery.

The Messrs WINSHIPS are now ready to execute orders for Fruit, Forest, and Ornamental Trees, Shrubs, &c., Isabella and other Grape Vines, among which are the Black Cape, 2 and 3 years old; SHEPARDIA TREES, strong and healthy plants, 2 feet high, at the reduced price of 50 cts. each, sure to do well, with common culture, being remarkable for their hardiness and beauty.

Any orders left with our Agent, J. B. RUSSELL, Publisher of the New England Farmer, will be promptly attended to. Oct. 12.

HORTICULTURAL REGISTER.

(PUBLISHED IN LONDON.)

The Horticultural Register, and General Magazine of all Useful and Interesting Discoveries connected with Natural History and Rural Subjects, is published monthly in London. Subscriptions received by

MUNROE & FRANCIS,
127 Washington street.

Oct. 26.

FRUIT TREES.

For sale at the KENRICK NURSERIES, in NEWTON, near Boston, a most extensive assortment of Apples, Pears, Peaches, Plums, Cherries, Apricots, Nectarines, Almonds, Mulberries, Quinces, Raspberries, Gooseberry and Currant bushes, Grape Vines of the best foreign sorts, and 25 finest varieties of Strawberries, including the most rare, productive and esteemed.

Also about 40 varieties of the most handy ornamental trees and shrubs, and superb hardy roses, including Silver Fir, varieties of Spruce, Flowering Horse Chestnuts, Flowering Catalpas, Mountain Ash with beautiful clusters of red berries in autumn and winter, Purple Aescia, Three Thorned and Thornless Aescia, Butternuts, Albion or tree of Heaven, Elm, American and Scotch, Sugar Maples, Weeping Willows, &c. do. Napoleon from St Helena tree, Honeyuckles. Many of the above sorts of trees of extra sizes, for ornamenting highways and commons.

WHITE MULBERRIES, genuine sort for silk worms, by the 100 or 1000 for Plantations.

ISABELLA and CATAWBA Grape Vines, either singly or at reduced prices by the 100 or 1000.

CHINA ROSES, CHINESE CHRYSANTHEMUMS, GERANIUMS, &c. &c.

Written orders addressed either to JOHN or WILLIAM KENRICK, NEWTON, are regularly received by the daily mail, and will be promptly attended to, or they may if more convenient be left with J. B. Russell, at the New England Farmer office, where also, catalogues may be obtained gratis on application. But purchasers are invited when convenient to call and examine the trees, &c. for themselves, and make their own selections; but when this is not convenient, then let them forward their orders, relying that the very best possible selection will be made for them. Trees when destined for a distant place, are carefully packed either in clay or moss, and mats, and delivered whenever ordered in Boston free of any charge for transportation. Oct. 19.

Economical Oils.

SAMUEL DOWNER has for sale at his Oil Factory, at the head of Foster's wharf, (in the building lately occupied by John Trull, as a Distillery,) the following oils: Initiation Winter Sperm Oil, made expressly and only for the Argand or Circular Wick Lamp, burns well, is free from crust, and will stand the cold as well, or better, than winter strained sperm.

Initiation Summer Oil, burns well in any Lamp, and quite free from crust.

Double Refined Whale Oil, also burns well in any Lamp.

N. B. The above mentioned Oils will not in any manner injure Lamps, and should they not, on trial, give satisfaction, will be taken back and money returned.

Also for sale,—Olive Oil, 1st and 2nd quality. Neats Foot, &c. do. Gas Oil, (so called) prepared from Alcohol and Spirits Turpentine. Single refined Whale Oil; Common, &c. do.; and Foots, suitable for Vessels' Bottoms, or Soap Grease. It Oct. 19.

Farm Wanted.

Wanted to purchase, or hire, a good Farm within seven miles, south or west of Boston, containing forty to eighty acres of land, with genteel dwelling house, good barn, &c. Apply to J. B. Russell, Farmer office, Boston—it by letter, post paid. Oct. 19.

(F) Ammunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. Jan.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention. EBENEZER WRIGHT,

46, Milk street, opposite Federal-st., Apothecary. August 5. Sept

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 103 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c., &c., which he will dispose of at as low a rate as can be purchased in the city. Watches repaired and warranted.

Grape Vines.

For sale by the Subscriber, at his Garden in Dorchester, several varieties of Grape Vines, Scotch Gooseberries, Althaus, and Forest Trees. Among the former are

Black Hamburg,	} 2 to 4 years old—have borne fruit the present year.
Oval Purple,	
Round Black,	
White Muscadine,	
White Chasselas,	} Constantia.
Constantia.	

Black and white Moscatel—one year old. The parent vines are represented to have borne clusters weighing 36 lbs.

Barcelona, a beautiful fruit, one year old.

Polonoia,
Mantuan Castal-
lana,
De Peta,
Clarence, or No. 13, a valuable variety, and great bearer.

Isabella,
Catwaba,
Bland,
With many other sorts.

Orders for any quantity of the above will be promptly executed, on application by mail, or otherwise, at the Garden, or at 7½ Congress street.

Oct. 5. 5t ZEBEDEE COOK, JR.

Bulbous Flower Roots.

For sale by J. B. Russell, No. 52 North Market Street, Boston—

A few Double Crimson Peony Roots—50 cents each. Large white Lily Roots, extra size, 12½ cts each—\$1.00 per dozen. Hyacinths, Tulips, Narcissus, Iris, &c.

New England Farmer's Almanac for 1832.

Just published by J. B. Russell, at the office of the New England Farmer, 52, North Market Street, and Carter, Henslee & Bibeck, Washington Street, the New England Farmer's Almanac, for 1832, by T. G. FISKE, Editor of the New England Farmer—the Astronomical calculations by ROBERT T. PAINE, Esq.

BRIGHTON MARKET—Monday, Oct. 24.

[Reported for the Chronicle and Patriot.]

At Market this day 1520 Beef Cattle, 1609 Stores, 4125 Sheep, and 3216 Swine. About 200 Stores, and 950 Swine have been before reported.

PRICES.—Beef Cattle—We quote for a few yoke of extra at \$5 25, prime at 4 75 a 5, good at 4 45, thin 2 75 a 3 75.

Barrelling Cattle—Mess 3 67 a 3 75; No. 1, 3 17 a 3 25; No. 2, 2 84, a 3.

Working Oxen—Plenty and in fair demand, many sales were effected. We noticed sales at \$50, 57, 60, 68, 72, 75, and 80.

Cows and Calves—Sales were effected at \$16, 19, 22, 21, 25, and 27.

Sheep—An unusual number of good Sheep were at market, and sales were slow; we noticed lots taken as follow—For Store Sheep 1 37½, 1 50, 1 62½ and 1 75; lots to be slaughtered at 1 92, 2, 2 12, 2 17, 2 25, 2 50, and 2 75; a lot, part wethers, at 3 and 3 50; a lot of extra at \$4 each, and a lot at \$5 each.

Swine—Market continues full; we noticed a number of 290, more than half Barrows, at 3c; one lot of 80, half Barrows, at 4½; lot of 60 selected, three thirds Barrows at 4½; a lot of 60, to close, at 3½c; many buyers are at market and will probably purchase tomorrow. Retail price 4½ for Sows, and 5½ for Barrows.

Stores—Sales continue to be made at former prices.

New York Cattle Market, Oct. 21.—At market this week 1000 head Beef Cattle, of which a much greater proportion than usual were very fine. All sold quickly at \$5 a 7. Sheep and Lambs 3000 in market, prices fairly sustained, if anything have advanced—we quote Sheep \$2 a 5, Lambs 2 a 3. Fat Hogs scarce and in demand—we quote 4-50. Cows and Calves in demand, and sell quick at good prices.—A. Y. D. Adv.

In the New York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

The following extracts are from a small pamphlet lately published by Lilly & Wait, and Carter & Hendee, entitled

KNOWLEDGE FOR THE PEOPLE,
OR, THE PLAIN
WHY AND BECAUSE.

Why are Burton, Nottingham, and other towns on the Trent, so celebrated for their ales?

Because the water with which the ales are made, runs over a rock of gypsum, or carbonate of lime; the hardness of the water being in these, as well as other instances, favorable to the manufacture.

The same brewer cannot, with the same malt, produce an equal beer, in any other part of the kingdom.*

The Barnstable and Liverpool ales, and some others also of excellent quality, are brewed with hard water. The Derby malt, much used in Lancashire, is found to make better beer in that county than in Derbyshire, and may be supposed that the Lancashire waters, generally containing much carbonate and sulphate of lime, occasion the difference.

Why was beer first called 'entire,' and 'porter'?

Because of the following circumstances.—Before the year 1730, the malt liquors in general use in London were ale, beer, and twopenny; and it was customary for the drinkers of malt liquor to call for a pint, or tankard, of half-and-half, that is, a half of ale and a half of beer, a half of ale and half of twopenny, or half of beer and half of twopenny.

In course of time it also became the practice to call for a pint, or tankard, of three threads, meaning a third of ale, of beer, and of twopenny; and thus, the publican had the trouble to go to three casks, and turn three cocks for a pint of liquor. To avoid this inconvenience and waste, a liquor was made which should partake of the same united flavors of ale, beer, and twopenny, which was called *entire* or *entire-butt*; and as it was a very hearty and nourishing liquor, it was very suitable for *porters* and other working people hence it obtained the name of *PORTER*.

Why does porter drink better out of a pewter or tin pot, than from glass or earthen ware?

Because of the galvanic influence of the green copperas, (used to give it a frothy top,) and the metal on the lips; thus forming, as it were, the elements of a galvanic pile.

Why are hops used in beer?

Because the aroma and bitterness of the hop take off the mawkishness of fermented worts, and prevent the beer from becoming sour.

Gervase Markham says: 'The general use is by no means to put any hops into ale: making that

the difference between it and *beer*, that the one hath *hops*, and the other none: but the wiser husbands do find an error in that opinion, and say that the utter want of hops is the reason why ale lasteth so little a time, but either dyeth or soureth, and therefore they will every barrel of the best ale allow half a pound of good hops.'—*Maison Rustique*, 1616.

Why was a pillow stuffed with hops formerly recommended for easing pain?

Because of the narcotic and stupefying effects of the hops which soon produced sleep.

Why are hops heavily pressed and closely packed?

Because it is believed to preserve their strength in keeping; if not so packed, they would become damp, and sometimes mouldy.

Why are old hops comparatively of little value?

Because the fine flavor of hops does not exist a twelvemonth. Beyond that time they are *old hops*; and are sold at a cheaper rate to the porter brewer. A year or two longer, and the bitter itself disappears, and the whole becomes nothing better than chaff. The same deterioration takes place when infused in the beer. The flavor is but of momentary duration, and the bitter principle gradually decays.

Why is the best cider made from judiciously mixed apples?

Because the requisite qualities of richness, astringency and flavor, are thus obtained, which seldom can be had from one kind.—*T. A. Knight*.

Why do not cider and perry rank as wines?

Because they contain so much malic acid, which is injurious to the fermentation requisite for wine. The acid in the grape is chiefly tartaric.

Why was the invention of wine probably coeval with the grape?

Because the delicious sweetness of the grape juice suggested its separation from the fruit, as a drink. The principle of fermentation is present in the grape: the juice, if kept a few hours, will spontaneously ferment; and the singular appearance of the effervescence, resembling boiling in the cold, would sufficiently stimulate curiosity to complete the process. The enlivening effects of the liquor when vinous, would also assist. It is, therefore, very probable, that wine was discovered nearly 6000 years since, very shortly after the creation of the world.

Why does olive oil, poured in a cask of wine, preserve it in draught?

Because the oil, spread in a thin layer upon the surface of the vine, prevents the evaporation of its spirituous part, and hinders its mixing with the atmospheric air, which would not only turn the wine sour, but change its constituent parts.

Why does wine crust in the wood?

Because of the constant evaporation, varying according to the wood of the cask, and the surrounding temperature. In casks of chestnut, it evaporates rapidly; in those of mulberry, oak, and other closed grained woods, it proceeds more slowly: it occurs, however, in all of these, which accounts for the vinous odor in a cellar where wines are stored in the wood, however thick the casks, and however careful they may be bunged.

Why is wine most liable to turn sour in spring and autumn?

Because at those seasons the fermentation is often renewed by frequent and sudden changes of temperature, which cause a corresponding expansion of condensation of the body of liquor, and of the air in the cask.

BY HIS EXCELLENCY
LEVI LINCOLN,

GOVERNOR OF THE COMMONWEALTH OF MASSACHUSETTS.

A PROCLAMATION.

FOR A DAY OF PUBLIC THANKSGIVING AND PRAISE.

Is the enjoyment of the richest Blessings of a Beneficent Providence, the People of this Commonwealth have been carried through another Revolution of the Seasons; and now, at the close of an abundant Harvest, with pious and grateful Hearts, they will seek to render to the SUPREME DISPOSER of all events, the BOUNTIFUL GIVER of every Good, their united tribute of ACKNOWLEDGMENTS, ADORATION and PRAISE.

With the advice and consent of the Executive Council, I, therefore, invite them to observe THURSDAY, the first day of December next, in offices of public THANKSGIVING to Almighty God for the unmerited and unnumbered riches of his Grace conferred upon them, individually, and in their relations to the community, through the past year. Let them consecrate the Day to the Worship and Honor of their Maker, and in Christian Communion in their respective Congregations, Adore that Mercy which has spared their lives, and given them capacities and opportunities for social, intellectual, and religious improvement. In devout meditation and prayer, may they recognise the manifestations of Divine Favor towards them, in the enjoyment of Health, while Pestilence has been permitted to desolate distant places; in the preservation of Peace, while War has ravaged other Countries; in the Plenty which has supplied their wants; in the Institutions of Civil Government which have secured to them personal liberty, and the exercise of the right of private judgment; in Literary and Charitable Associations which are directed to enlightening the minds, and elevating and expanding the affections of Men; in the possession of the Sacred Scriptures, in their simplicity and purity, by which they have a knowledge of the revealed will of God, and the hope of Salvation, through the ministry and meditation of their Blessed Saviour, the Lord Jesus Christ.

And while, with grateful Hearts, they recount the Blessings by which this Nation is distinguished above all other People, may they unite SUPPLICATION with THANKSGIVING to Heaven, imploring the continued smiles of Divine Providence upon our Beloved Country: that the Union of the States may be confirmed and perpetuated; that the Government may be one of Laws wisely framed, and justly administered; that intelligence, patriotism, virtue, and piety, may animate the People, and a sense of responsibility and faithfulness to duty, direct their public Officers. And may the sincerity of their acknowledgments of Dependence, and of their ascriptions of Praise, be manifested by Sympathy for the Oppressed, and an active Charity in the relief of the Destitute of their Fellow Men.

Given at the Council Chamber, in Boston, this seventeenth day of October, in the year of our Lord one thousand, eight hundred and thirty-one, and in the fifty-sixth year of American Independence.

LEVI LINCOLN.

By His Excellency the Governor,
with the advice and consent of the Council.
EDWARD D. BAXOS, Secretary.
God save the Commonwealth of Massachusetts.

November 24th, is appointed for the annual Thanksgiving in New Hampshire.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

Printed for J. B. ROSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for printing received by J. B. ROSSELL, at the Agriculture Warehouse, No. 52 North Market Street.

* A curious circumstance lately occurred in connection with one of the able treatises published by the Society for the Diffusion of useful Knowledge, in 'the Art of Brewing,' the author of which treatise stated that gypsum and chalk were used in the manufacture of Burton ale. The ale-brewers at Burton, conceiving themselves aggrieved by this charge of sophistication, commenced an action against the Society, in the Court of King's Bench. This action was, however, withdrawn, when it was urged by Mr Brougham, that the author of the treatise had stated this as a fact, because he had been unable to prepare ale similar to the Burton, without the admixture of these ingredients. An experienced chemist was subsequently sent to Burton, to whom every facility was afforded by the brewers, and who found that these substances were largely contained in natural solution in the water with which the brewery was supplied, and which takes its rise in a gypsum rock. With an understanding that this explanation should be published in each succeeding treatise, the action was withdrawn by the counsel for the prosecution.

NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, AT NO. 52 NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE.)—T. C. FESSENDEN, EDITOR.

VOL. X.

BOSTON, WEDNESDAY EVENING, NOVEMBER 2, 1831.

NO. 16.

COMMUNICATIONS.

LIVE FENCES OF THREE THORNED ACACIA.

Mr FESSENDEN—The rain having driven me within doors, I sit down to comply with your request, in regard to the culture of live fences.

Your Providence correspondent should take up his three thorned locusts in his seed rows, and replant, for three reasons:—1. That he may dig and pulverize his ground, an important requisite; 2. That he may size his plants; and 3. That he may insert them at regular distances. The two latter are essential to the beauty and regular growth of the hedge, and to its after management.

My practice is to plant at ten or twelve inches, generally in a single row, but sometimes in double parallel rows, one foot apart, where I require a very strong hedge. At two years from planting, autumn of 1830, I cut a part off at the uniform height of two feet. Another part I splashed, or bent and partially cut at that height, and wattled the tops horizontally to the right and left, alternately, of the contiguous plants, but all one way. Last spring I laid in a third parcel when in full foliage. All these have done well, and have made from three to five feet of new wood. I think the laying or splashing is far the preferable way, as it presents a formidable horizontal barrier, which must strengthen with the growth of the hedge. A fourth parcel, planted three years, about an inch in diameter, and 7 to 9 feet high, I design to lay this fall.

I generally manure the strip I intend for a hedge, and cultivate it with potatoes the summer preceding planting. I prefer two men and a boy to assist in planting. I draw a line where I intend to plant, and throw up a trench of the requisite depth and breadth for the roots of the quicks, and if the soil below is poor, go a little deeper, and throw in some surface soil at the bottom. The earth is all thrown to the front, and the back edge of the trench is made perpendicular, that the plants may be set upright and in a line. A boy drops the plants on the line or back side of the trench, and I proceed to plant, placing the heel of the plant against this side, and gauging it to a proper depth with my hand, when a man throws upon the roots a shovel full of earth, which keeps the quick in its position. This is repeated until the planting is completed. A second hand fills the trench; when the earth is trodden and the quicks are made to present a straight regular line. With two men and a boy I have planted 1000 and 1500 quicks in a day in my grounds.

The plan which I have resolved to pursue for after management, is to omit laying or splashing till the third year after planting, when the quicks will be about an inch in diameter, and then to lay them in at a slight angle of 10 to 15 degrees, and at the height of two feet; to cut in the side wood every summer with the bill hook; keep the lower part of the quicks free from brush wood, and the ground about them free from weeds and grass; and at two years from the first splashing, four years from planting, to repeat the operation at

the height of four or four and a half feet, when I think the fence will be complete, and require only an annual clipping with the bill hook, and become a complete barrier to every description of domestic animals.

I feel a strong confidence, that a substantial fence may be grown from the honey or three thorned locust in six, or at most seven years, from the seed, and at a less expense than it will cost to build and maintain any good dead fence for two years. Upon this last point, however, I am not prepared to give precise data. Yet I will hazard a calculation. Twenty plants are amply sufficient for a rod, of course 1000 quicks will plant 50 rods. Let us assume this as the basis of our calculation. The 1000 quicks, at one or two years old, will cost \$5. Three men will easily plant them in a day. Allow a day and a half every year for cleaning and clipping the 50 rods. This will require 9 days' labor in the six years. Estimate the labor at \$1 per diem, and it gives for this item an aggregate of \$12; add \$5 for the quicks, and it makes a total of \$17, or 34 cents per rod, as the expense of planting and growing a live permanent fence, proof against the depredations of boys and bulls. Treble this sum, and call the cost \$1 per rod what a pittance is the expense compared with the advantages afforded by a fence of this description, which shall protect your crops from depredation, and in a measure from the bleak winds of winter, and which is permanent in its duration. The lowest price of a post and board fence here is \$1 per rod. It will last 12 years, and requires 5 per cent per annum to mend and keep it in repair. I have used no extra fence for protecting the hedge. I plant near an existing partition fence, and exclude cattle while the growth is tender. Cattle will seldom eat browse while they have good pasture.

J. BUEL.
Albany Nursery, Oct. 20, 1831.

ECONOMY IN FATTENING HOGS.

I have thrown by my steamer for hog food and substituted a boiler, and I think with manifest advantage. The former consisted of a 60 gallon cask, over a potash kettle, badly set. I could only work off four or five casks a day, with great labor and trouble and the apparatus required to be luted with clay at every operation. With my new kettle, holding 30 galls. which is a thin beautiful casting, I have cooked eight and nine barrels in half a day, and much better than by the steam process. This food consists of small refuse potatoes, of which I have nearly 100 bushels, or 15 per cent of my whole crop, pumpkins and a small quantity of Indian meal. A half day's boiling serves my hog family four or five days; and it is always kept prepared in advance. The actual expense of fattening hogs thus upon the refuse of the farm crop, is 50 to 75 per cent less than feeding with dry corn.

The economy of my apparatus consists much in setting the boiler so as to have all the advantage of the fire. The interior brick work is made to conform to the shape of the boiler, leaving an interval of four to six inches between them for the fire, round the whole exterior of the kettle, with the exception of a few inches at top, where the

flange or rim rests upon the projecting brick. Thus the boiler is not only encompassed by the flame but the heat is augmented by radiation from the brick work. The fuel is burnt on a grate, which extends nearly to the kettle, four or five inches above the level of its bottom. My boiler being in operation while I am penning these remarks, I have ascertained, that a kettle of potatoes, with three pails of cold water, covered with boards, has been completely boiled in 18 minutes from the time they were put in, another boiling having been just previously taken out. My kettle was set by a son in his teens, without assistance, and was his first effort in masonry. J. BUEL.

Albany Nursery, Oct. 20, 1831.

CHINESE MULBERRY. (*Morus multicaulis*.)

We had two plants of the Chinese mulberry in our nursery last season, one budded, the other on its natural root. They both grew vigorously, and both were killed by the severity of the winter, root and branch. I mention this fact as suggesting a doubt whether this desirable plant will endure our winters. I would like to learn how it has fared in your neighborhood, during the last winter.

J. B.
Albany, 1831.

BLIGHT IN PEAR TREES.

The disease of the pear tree, termed *blight*, has been less prevalent this year than during years past. But it seems to have assumed a new character, or changed its mode of attack. In the early part of the season I discovered that the epidermis on the bodies of several trees, of two to four inches in diameter had become brown in spots, and was cracked and separating from the true bark; and in some instances I found the disease had extended to the wood. I immediately had them washed with a weak solution of chloride of lime, which seems to have restored them to health. I applied the chloride the preceding year to the stumps of some amputated branches, in some of which cases the disease had extended down upon one side of the bole of the tree. In every case the disease was checked, and the live parts have protruded beyond the dead wood. Although Mr Lowell, whom I highly respect, and whom I am ambitious to propitiate, detests all theories, I am nevertheless induced to hazard my theory in this case. It is this, that the disease is owing to a minute insect, which preys upon the bark, and vitiates and poisons the elaborated sap; and that the chlorine destroys the insect and becomes an antidote to the poison. From partial experiments I am induced to believe, that chloride will prove an efficient preventative to the mildew on grapes also. These suggestions are hazarded in the hope that they may lead others to make more satisfactory experiments.

Oct. 20, 1831.

MANUFACTURE OF SILK.

Mr EORTON—In a late journey to the eastward I called on Mr Enoch Boynton, innkeeper, of Newbury, and had some conversation with him relative to the growth and manufacture of silk.

He informed me that he had made the silk business a study for forty years, and was convinced of

the utility and practicability of its being pursued as a lucrative branch of business.

He stated that the inhabitants of the United States, can be clothed with silk goods with less land and less labor than with flax, wool, or cotton, and that it can be made impervious to water, for outside garments, while cotton, wool, and flax can be made useful for inside.

I perfectly coincided with him relative to converting the cocoons into silk goods with less expense and labor than cotton, wool, or flax are manufactured; for in converting cotton into goods it has to be cleansed from seeds &c; it is then broken and finished ready for drawing, and has to pass through a card called a breaker, and another called a finisher—then through the drawing, roping, process, and then spun and woven. The machinery for breaking, finishing, drawing and roping &c, is very expensive,—all of which is not necessary for the operation of silk.

Silk is first drawn from the cocoons by a reel, say like those of D'Homerque's or Du Ponceau's of Philadelphia or J. H. Cobb, Esq. of Dedham, or E. Boynton's of Newbury. It could then be taken, spooled, and twisted and doubled for such kind of goods as are intended for manufacture. Then washed and woven by water or steam power as well as cotton, wool, &c., and with much less labor than the afore-mentioned materials. He informed me he had upwards of fifty thousand white mulberry trees of 2, 3, and 4 years' growth, a part of which he would sell at extremely low prices, and of such ages and quantities as to suit purchasers.

The trees will do to take up and set out till the ground is frozen and as early next spring, as the frost is out till the month of May. He stated that he pruned a part of the aforesaid tree this year, and gave the prunings to the silk worms which produced upwards of seventy pounds of cocoons, which were stifled in an oven with a temperature of 140 down to 120 degrees by the thermometer. He took the prunings without separating the leaves and placed them among the worms to feed on, and thought they did better than if the leaves were stripped off, as the worms would climb and eat themselves on the branches—as intended by their beneficent Creator.

The improvement he has made on his silk mill, will no doubt be of utility. He ran from said mill 2000 yards of different sized thread, reeled and spooled from the cocoons, and laid on spools or bobbins in such a manner as to be put into a bobbin nest for doubling and twisting for any fabric wanted.

He declines exhibiting said mill at present, for various reasons; one of which is the great hindrance it would make him, to gratify the idle curiosity of people who might call on him.

Bristol, R. I. Oct. 24, 1831. BONO PUBLICO.

Remarks by the Editor.—We esteem the above valuable information, and would take this occasion to recommend the introduction or at least the more general trial of the Chinese Mulberry, (*Morus multicaulis*) as a substitute for the white mulberry. Its properties are said to be the following. It continues low and bushy, so that the leaves can always be gathered without a ladder, and the leaves are of large size, very tender, grow in abundance, are eaten with avidity by the worms, and the silk they produce is of the first quality. This species of mulberry may be obtained by application at the office of the New England Farmer, No. 50½ North Market street, price \$1 each.

FOR THE NEW ENGLAND FARMER.

PODOPHYLLUM PELTATUM.

This plant has in different places, different common names: as May apple, Lime plant, Reuben's Mandrake, &c. It delights to grow in a rich, moist soil and in a shady situation. It will not produce large fruit until the roots have extended themselves and acquired strength. It is a singular plant, the whole, stem, leaves, flower and fruit, is formed in the earth, and nothing appears after it rises above the surface but the extension of parts. The stem is smooth, round and rises about 12 inches above the surface, has two peltate palmate leaves, deeply divided into several lobes. In the fork of the stem proceeds the flower and fruit. The flower is white. The fruit ovate in shape, is green while growing, and yellow when ripe, agreeably acid, delicious to many, and salutary.

The roots, which are large, creeping and jointed, are medicinal and supply the place of jalap, being far less nauseous than that drug: and from this circumstance alone the plant deserves extensive cultivation.

'We have,' says Doct. Bigelow, 'hardly any native plants which answer better the common purposes of jalap, aloes, and rhubarb and which is more safe and mild in its operation. The root is the part to be employed, and should be given in substance in fine powder. I have commonly found 20 grains to operate with efficiency, and not to be attended with pain and inconvenience.' 'The root,' observes Doct. Thacher, 'is an excellent purgative in doses of 20 grains. It is most advantageously used in combination with calomel or crystals of tartar. The root often operates as an anticholeric, and as such, it is used by the Cherokee and other Southern Indians.'

The medicinal properties of the Podophyllum peltatum are well established by the above named eminent physicians.

The fruit which was exhibited in the hall of the Massachusetts Horticultural Society the season past was of good size, but not the largest. It was grown under the full influence of a scorching sun.

FOR THE NEW ENGLAND FARMER.

BEANS.

MR EDITOR—As the bean is among the most valuable productions of the kitchen garden, it is important that the best variety should be known. I have taken some care to ascertain this point. Last spring I planted the Dwarf, or Bush Kidney, the China and the Early Canada, in separate rows, eight rods in length, and a pint of seed in each. They were fit for use in the order named, with a few days' intermission. The Kidney is a rich prolific bean; but soon in maturity and out of use and liable to mildew. The China is also good productive, and more lasting. But the Canada, in my estimation, was superior to the other kinds. As it purported to be an early kind, I planted it for a Bush bean. On discovering its propensity to ramble, I placed on alternate sides of the rows the bushy prunings of my trees, of three feet apart, heading them down to five feet in height. These were soon covered by the exuberant and vigorous shoots; but the process of maturation of the early pods was not retarded. From their first coming into use to this day, Oct. 22, there has

been no time when a supply could not be obtained for the table, for either stringing or shelling. They are still in blossom and vigor. No frost as yet has materially injured them. Nearly a bushel of pods has been lately gathered for future use. In addition to a supply for the season, from these kinds, I have gathered from the Canada a peck of dry beans, as they became liable to waste.

Running beans are the most productive; and when early, their value is greatly increased. My practice with all kinds of this description is, to support them with high brush, or untrammelled saplings. By this method their produce is materially increased.

O. FISKE.

Worcester, Oct. 22, 1831.

PARSNIPS.

To the Editor of the New England Farmer.

Sir—You have published some remarks on Parsnips in one of your late numbers. But in looking over my books, I find the means of making some supplementary observations, extracted from an edition of a work entitled '*Gleanings from the most celebrated Books of Husbandry, Gardening and Rural Affairs*,' which was printed at Philadelphia, in 1803 from the second London edition, the Philadelphia edition being interspersed with remarks by a gentleman of Philadelphia. This Philadelphia gentleman was no other than the late well known Mr Bordeley, a very excellent and amiable man, who has left behind him various valuable monuments of his zeal for the public good, especially in matters concerning agriculture.

Under the head of '*Garden Parsnip (Pastinaca sativa)*' I find the following particulars in the above named work, which are copied with slight variations not affecting the sense.

'Soil. A rich deep loam; next to this sand; stiff or hide bound land is destructive to them. If the soil be proper it will require very little manure.'

'Seed. Sown [in England] in February or March. It is also sown in autumn immediately after the seed is ripe. Sowing at this latter season prevents the young plants being choked with weeds. The frost neither injures the seed or plant.'

'Culture. If sown broadcast the plants are to be thinned to ten inches or a foot asunder. If drilled the distance of the rows to be 18 inches, the plants to be thinned to the distance of 10 inches, horse hoed twice and earthed at the second time, but not so as to cover the leaves. If the tops are cut off, but so as not to injure the crown it will increase the size of the roots.* Though left in the ground they are not injured by the frost. If housed, they are to be dug when the leaves begin to decay, which should be cut off 3 or 4 days before they are laid up. They are to be put in sand in a dry place. The leaves are dangerous to handle (especially in a morning, while the dew

*We apprehend that there is a mistake in this assertion. It has also been maintained by some agriculturists that the tops of carrots might be cut off as soon as the lower leaves begin to wither without injury to the root. But the Massachusetts Agricultural Jour., vol. iii. No. 3, p. 181-2 gives the details of certain experiments made by the Hon. J. Quincy, in which a certain number of beds of carrots were cut, and the same number of similar beds were left uncut, and the advantage was in favor of the latter, about as 8 to 5. From the result of these experiments, Mr Quincy concluded 'that the carrot forms no exception to the usual analogy of nature in the growth of vegetables,' which depend nearly as much upon the leaves as the roots. We do not believe that the laws of vegetation with regard to parsnips differ from those which regulate the growth of carrots and other plants.—Ed. N. E. Farmer.

remains on them); raising blisters full of a scalding liquor, which has proved very troublesome for several days. To be planted for seed in January. [As early as frost will permit in this country.]

'Use. They are equal if not superior to carrots for pigs, as they make the flesh whiter. Clean, washed and sliced among bran, horses eat them greedily, and thrive therewith. Nor do they heat them, or fill them with disorders. They fatten sheep and oxen in a very short time. According to a proposition of the Jersey board of Agriculture [in the British Channel,] a beast quite lean, will be rendered quite fat by parsnips in three months. An agreeable liquor is made of the roots boiled in water, with hops, and afterwards fermented with yeast.

'WILD PARSNIPS. The root and seed of this sort are sometimes used in medicine.

'COW PARSNIPS. (*Heracleum sphondylium*) cow parsnip, is collected in some parts of Sussex [in England] for feeding swine. Its culture has been recommended, as not only swine but cows, sheep and rabbits are partial to it. It is of an early and rapid growth, and the seeds are most easily collected. Cow-parsnip is often called Hog-weed from swine being so fond of it.'

Thus far from the *'Gleanings,'* above mentioned. From what has been said in your number above referred to and in the passage in the gleanings here extracted, enough, perhaps, will appear to make the experiment of cultivating parsnips in the United States worthy the notice of different enterprising persons. The *'Long Dutch parsnip'* is advertised for sale by Mr J. R. Russell, the Publisher of the *New England Farmer*. Portions of the seed of the garden parsnip, raised in England (as obtained from some seed imported from England above thirty years ago) and which appears to have undergone no degeneration whatever are placed in the hands of the Hon. H. A. S. Dearborn, and the Hon. John Welles for distribution.

From Prince's Pomological Manual.

CHERRIES.

ELKHORN. PR. CAT. PR. HORT. LOND. HORT. CAT.

Elkhorn of Maryland.

This is one of the largest black cherries I have ever seen; its size varies little from that of the Black Tartarian, but it ripens two weeks later, and is peculiarly distinct from every other kind that has met my observation, the flesh, when eaten, having a liver-like consistence and being very solid. It is perhaps less highly flavored than some others, but still a superior fruit; and from its solidity is well calculated for transportation to the markets, and its ripening at a later period causes it to be very suitable for filling up the space between the ripening of the earlier Duke and Heart Cherries, and the later varieties. It was discovered by the father of the author on a tour through Maryland about thirty-four years ago, growing, in a garden attached to a hotel who finding it very different from any that he had seen brought home some scions for inoculation. The landlord called it the Elkhorn, which name has been adopted for it. The tree is exceedingly vigorous, and its bark of so peculiar an appearance, that it may thereby be distinguished from the trees of other varieties.

REMINGTON WHITE HEART. PR. CAT. PR. HORT.

This variety was presented to the father of the

author in 1823, by Zachariah Allen, Esq. of Providence, Rhode Island, who transmitted a tree, which he stated was budded from the original one, accompanied by the following description:

'This is a new variety raised from a stone, planted about twenty years ago by Mr Remington of this vicinity. It is remarkable for being in perfection very late in the season, when all other cherries are past. The color of the fruit is yellow, tinged with carnation on the sunny side; the flesh is firm, and somewhat resembles a Bigarreau. The tree bears profusely in clusters, and the cherries are not perfectly ripe here until September.'

In addition to the above, a branch was sent from Rhode Island about the 10th of September full of fruit, which was then but just ripe. The flavor of the cherries is pleasant, but not superior, their greatest merit being the very late period of their maturity. This is the latest variety which has originated in our country, and in this vicinity ripens at the end of July or in August.

WATERLOO. PR. CAT. POM. MAG. HORT. TRANS. LOND. HORT. CAT.

This valuable variety was introduced to our country by the Hon. John Lowell of Massachusetts, to whose arduo, intelligence, and liberality in horticultural pursuits, his fellow-citizens are so largely indebted for numerous interesting acquisitions, and to whom I am happy to render this passing tribute of respect. I extract the following description from the Pomological Magazine:

Raised by Mr Knight, from the pollen of the May Duke and a seed of the Ambree of Duhamel. It ripens in June. The tree partakes of the character of both its parents in a remarkable degree; the wood and leaves are those of the Bigarreau tribe, while the flowers are those of the May Duke, the stamens being shorter than the styles, a peculiarity which is universal in all the Duke Cherries. For this observation we are indebted to Mr Thompson. The wood is strong, with a grayish cuticle; leaves drooping, large, wavy, with moderately deep serratures; flowers large; petals roundish, imbricated; stamens rather slender, usually shorter than the styles; fruit very large, broad and cordate at the base, convex on one side, flattened on the other with a broad suture; apex slightly depressed; skin dark purplish red, or almost black, covered with numerous minute dots of a paler color; flesh deep purplish red, darkest next the stone, from which it parts freely; tender, juicy, with a rich sweet flavor; stalks long and slender; stone small, roundish, compressed.

ALLEN'S LATE FAVORITE. PR. CAT.

This variety was presented to my father by Zachariah Allen of Providence, a gentleman distinguished for his intelligence in horticultural pursuits. The tree grows vigorously; the fruit is of fine quality, juicy and well flavored, and ripens in Rhode Island at the same time as the Black Mazzard, which, constitutes its particular value, as most of the finer varieties are then past. The fruit is sold in considerable quantities in the markets at Providence.

GRIDLEY. MASS. HORT. SOC.

Maccarty. Apple Cherry.

This variety was discovered thirty-seven years ago, by Mr Wm. Maccarty, of Roxbury, near Boston, growing in the garden of Deacon Samuel Gridley of that town. He states that the tree was then five or six inches in diameter. The flesh is firm like the Bigarreau, sprightly, and fine fla-

vored; the color is black; the size that of a medium Black Heart, but the stem is shorter and stone smaller. It comes into eating immediately after that variety, and is much esteemed as a market fruit, and possesses the advantage of bearing ear-riage well. Its only defect is, that when near maturity, if the weather be damp or wet, the fruit cracks open and spoils. The tree grows upright, and is vigorous when young, but is said to be subject to a premature decline from the abundance of its produce.

From the Dutchess Republican.

INTERESTING TO WOOL GROWERS.

A gentleman of this village has politely furnished us with the following extracts of a letter from his correspondent, dated,

'London, Sept. 1, 1831.

'If your wool market should become flat for a certain time, caused by opinions and various other circumstances, we yet think it will take a favorable turn for all *low wools* at no distant period, if it will at all be susceptible to regulate itself fairly with the situation of our own European markets, which latter are at the present moment in a most singular position; for Russia, Prussia, Austria, France and Holland, have each large armies on a warlike footing. The military must be clothed, for which purpose contracts to supply cloth and blankets to an enormous extent are now executing by continental manufacturers, who overrun all the districts where wools are produced, and eagerly buy up all the low wools fit for their purposes. For this reason all the *good low wools*, costing here 2s. per lb. and under, will be consumed on the continent of Europe; none or, comparatively speaking, very little, will reach this country, although so much is wanted by our own home consumers. We could now sell 1000 bales in one day of *good low German wools*, at and under 2s. per lb. to our manufacturers, but we have none to offer, and all the other commission houses are similarly situated. There are some low wools here, but we cannot call them good. During the next six months 20,000 bales of Spanish wools are expected here: these Spanish wools, then, and our own English wools, will be required to supply the loss of the German low wools. Good *clean low German wools* are 2d. per lb. higher than they were 3 months ago, but there is none here at present under 2s. The stock of fine German wools, from 2s. 6d. a 4s. 6d. is very considerable, and our expected importations will principally consist in these descriptions, for reasons described above.

'We have to add, likewise, that in consequence of the rigorous quarantine laws and cordons sanitaires, more than 100,000 cwt. of wools are locked up in the different places of growth, such as Poland, Hungary, &c. on account of the raging cholera morbus.'

The quantity of silk used in England alone amounts in each year to more than four millions of pounds' weight, for the production of which, myriads upon myriads of insects are required. Fourteen thousand millions of animated creatures annually live and die to supply this little corner of the world with an article of luxury!

An editor in Ohio extracts a *running* account from his books, for the benefit of his brethren respecting B. R. Wickham, Esq. Dr to 1 year's subscription \$2 50, and per contra, Cr. by running away—in full \$2 50.

Agricultural.

REPORTS

Of Committees at the Annual Meeting of the Bristol Agricultural Society.

ON AGRICULTURE.

The Committee on Agriculture are impressed with the fact, that the efforts which have been made to improve the useful arts, are greatly disproportioned to their relative importance. If it were not so—if the progress of each had been according to its utility, it is quite certain that Agriculture, which is the basis of all the other arts, and the oldest of all, the one which employs three fourths at least of nearly every civilized country, would now be in advance of all others. It might be expected too, that it would everywhere engross most of the public attention and interest. The Mechanic arts, however necessary and useful, are subordinate to this. To little purpose, indeed, would manufactories, labor-saving machines, steam engines or ships, be constructed, if the cultivation of the earth were abandoned. In this, in a word, is found the aliment which vivifies and sustains all the other arts. Yet, with this fact, apparent and acknowledged improvement in agriculture has always been comparatively tardy even in countries where it has been or is now most cherished. In the U. States, it is but a few years since public opinion would suffer any attempt to alter the ordinary and accustomed modes of husbandry. A more auspicious sentiment now prevails. It has been demonstrated that soils possess essentially different properties, each adapted to the growth of some grain or vegetable and unsuitable for others; that a greater variety of manures than was formerly known suited to different soils, may be made and distributed with profit; that breeds are advantageously changed or mixed; that fruits may be increased in variety and improved in quality almost without limit and with little cost; in a word, that the capabilities of the earth for production have been, and even now probably are, but imperfectly known. To develop them, the efforts of the patrons of agriculture will be always especially directed.

The committee are gratified in being able to state, that the products which it has fallen within their duty to examine, afford evidence that the work of agricultural improvement is begun, and indeed considerably advanced in this vicinity. The quantity of cheese offered is greater than has been exhibited in several years. In quality also, it has not in the opinion of the Committee, often, if at any time, been exceeded. Several lots for which premiums could not under the regular terms of the Society, be awarded, would at other exhibitions probably, have procured the bounty of the Society.

The Butter was less in quantity than has been exhibited at some past exhibitions. For the most part, it was well worthy of exhibition, furnishing very satisfactory evidence of skill and neatness in the dairies at which it was manufactured.

Three lots of honey were presented, differing very little in quality. According to the regulations of the Society, therefore, the premiums are awarded with regard to quantity manufactured by the applicants. As two premiums only are offered for honey, the third applicant having the least quantity is without any claim on the bounty of the Society. As the honey offered by him was of a quality to warrant a premium under other

circumstances, and some improvement also in the method of raising bees having been communicated by him, the Committee were of opinion that he is entitled to a gratuity and have accordingly so awarded.

The premiums awarded are as follows:

FOR BUTTER.		
1st premium to Jacob Dean, Mansfield,	\$6.	
2d do. Peter Thatcher, Attleboro'	\$5.	
3d do. Joseph Dean, Taunton,	\$3.	

FOR CHEESE.		
1st premium to Seth Hodges, Norton	\$6 00	
2d do. Edward Leonard, Raynham,	5 00	
3d do. Joseph Dean, Taunton,	3 00	

FOR HONEY.		
1st premium to Wm. Stearns, Mansfield	\$4 00	
2d do. Simeon Green, Mansfield,	2 00	
Gratuity to Jacob Shepard, Norton,	2 00	

A gratuity of two dollars is awarded to Doct. Samuel Dean, of Easton, for a quantity of sweet potatoes raised and offered by him for exhibition. No premium is provided for this product. In appearance they resemble more nearly than is usually seen potatoes of a southern growth.—Doct. Dean states that from five hills he obtained the present season two bushels and a peck of potatoes of a size and quality similar to those exhibited.

There is in the county of Bristol and in the whole of the old Colony, a large proportion of soil well adapted to the production of this root. Dry, warm and sandy land, often of little value for other products, appears to be best suited for this. Another fact should encourage the cultivation of them—the crop is bountiful and raised at small expense.

They are beyond any doubt the natural product of a more southern and warmer climate than that of New England, and consequently they depreciate somewhat in being transplanted here. It is necessary, therefore, in order to preserve their quality, to obtain, yearly, slips (which are the smallest of the potatoes and of little value for anything but planting) from Carolina. These may be procured in the Spring at Boston and perhaps other places in New England, at trifling cost.

The premiums for grain and vegetable crops will, according to the published regulations of the Society, be awarded on the first Wednesday of March next; at which time a second Report, or the completion of the one now made may be expected from the Committee.

JACOB CHAPIN,	} Comanitee.
HORATIO LEONARD,	
ELLIS HALL,	
CROMWELL LEONARD,	

ON WHITE MULBERRY TREES.

The Committee on WHITE MULBERRY TREES, have attended to the service assigned them and submit the following Report:—

There were seven competitors for premiums by persons living in different parts of the County. In the whole there were entered 19,458 trees, of which number there were in the judgment of the committee only about 900 fit for transplanting to the place where they are finally to stand; the greatest number being merely plants, the growth of one season, and very much crowded together.

Your Committee are of opinion that Mulberry Plants of one or two years' growth ought not to be considered as trees in the present case.—One ounce of mulberry seed will, perhaps, produce

10 or 12 thousand plants, on a very small piece of ground; and these without further cultivation would be of no use whatever. The plants should be taken up after the first year's growth, headed down, the tap root removed, and placed in rows in the nursery 3 or 4 feet apart, and 10 or 12 inches from plant to plant in the rows. By this process in three or four years they will probably be fit to remove to the place in which they are desired to stand. The object of offering a premium on any number of mulberry trees is the public good and not merely private interest. Should any person receive a premium for any number of plants raised from seed sown the previous spring, he might neglect a further cultivation of them, all of which would in this case be lost, and the community receive no benefit. It is presumed, that in the list of premiums for 1830, the meaning of 'having in a course of cultivation, and in the most thrifty condition' is that the trees shall be thrifty, of good size, and fit to be transplanted into an orchard where they are to stand.

Rescom Hart of Dighton, had 210 trees, four years old, from 8 to 9 feet in height, and very thrifty. Also 371 of three years' growth from 6 to 8 feet high; the whole under fine cultivation and fit for transplanting, besides 90 of 4 years' growth lately set out on his farm. Your Committee award to him the first premium, the sum of 15 dollars.

John Macomber of Westport, had about 200 trees fit for transplanting, some of which were 6½ feet in height, thrifty and under good cultivation, besides a considerable number lately sold. Your Committee award to him the second premium, the sum of 10 dollars.

Your Committee regret, that from the youth, size or manner of cultivation of the plants of the other competitors, they cannot recommend a premium.

ROLAND GREEN, } Committee.
ALFRED BAYLIES, }

Carolina Potatoes.—The Editor of the Essex Gazette has been furnished with a sample of eight or ten bushels of sweet potatoes, raised in the garden of the Rev. Mr Perry of Bradford. They are as large and equal in all particulars to the imported. We see nothing in the way of a general cultivation of this valuable root in this region; and should be glad of the introduction of many southern radical notions; always excepting nullification.—Salem Register.

Let every farmer divide his pasture ground as he pleases. Let the fence between his arable and pasture land be as strong as an external fence. But, if possible, let all his arable ground, though it be an hundred acres, be in one lot. Then his plough runs clear, in a long furrow. His tillage is divided only by the different species of grain and vegetables he cultivates. There are no fences of consequence, no inconvenient and worthless head lands; no apology for thistles and nettles. The scene is beautiful to the eye. The whole has the appearance of a garden, and begets to the farmer a sort of horticultural neatness.—Gardeners' Jour.

New Lamp Oil.—Mr Isaac Smith, of Virginia, has made a discovery, by which he is able to render castor oil equal to the best winter spermaceti, for burning in lamps. The oil prepared for burning will cost about 36 cents a gallon.

AMERICAN INVENTIONS.

The annexed article is from the New York Evening Post. It appears that the yearly average of improvements in the arts, &c., in the United States, entered in the Patent Office, is about one hundred and sixty-six.

We have before us a record of all the improvements in the arts, mechanics and manufactures invented in the United States and entered in the Patent Office since the year 1793, when the first patent law was passed. It is contained in a document transmitted last winter to Congress by the Secretary of State, and comprises a list of no less than 6000 inventions, the product of American ingenuity in the course of 36 years. During that period, the plough has been made to undergo 124 improvements. 119 threshing machines have been invented. The great problem, the extraction of butter from cream without fatigue to the operator, has been solved in 80 ways by the inventors of 80 churns; and the laundress has been allowed her choice out of 125 washing machines. 123 machines have been invented for making nails; the number of new spinning machines exceeds 100; the number of improvements in the loom is 73; and in the manufacture of hats 43. The number of steam engines exceeds 100, that of stoves nearly the same. There have been 42 new ways contrived for manufacturing combs, in which we presume is included the late ingenious invention of cutting them by a single operation, into all sorts of figures, 3 new machines for paring apples have been invented and 3 gridirons. Pencil cases, ramrods, razors and suspenders, have each been subject to various improvements. An invention has been patented under the name of 'dog power'; another termed an 'elevator of pots and kettles'; and a third destined for a useful domestic purpose under the sonorous Greek name of 'Hæmagnæ-lactophorus.'

Gas Lights from water.—An English paper informs us that a highly interesting discovery is about to come before the public, resulting from the experiments of Professor Donovan, and Mr Lowe, of Bricklane Gas works. Letters patent have been obtained for the invention; the subject is very much talked of, and the question generally asked is, how is the gas made? At present no satisfactory information respecting the process can be given; but we understand the hydrogen gas, obtained by the decomposition of water, is charged with an illuminating principle by passing through some liquid procured during the distillation of pit coal, in the ordinary process of gas making. The requisite apparatus is much more simple than that used at present. The new gas is very superior in illuminating power, and may be obtained at a much lower price. If such be the nature of the process, and if no serious difficulty arise when tried on a large scale, it is evident the invention will be considered almost invaluable.—*Boston Medical Journal.*

Steam Carriage.—An ingenious mechanic (Goulding) has completed a steam carriage, which made its first appearance, by way of experiment, at Dedham, last Wednesday. We learn from the Dedham Patriot 'at 10 o'clock it moved with rapid facility from the workshop, and ascended a rise of about 45 degrees for fifteen rods with perfect ease; then proceeded about half a mile on a level route, and returned.'

Washington Family.—The lamented Col. Warick was the last of the military Secretaries associated with Harrison, Hanson and Jonathan Trumbull in the war of the Revolution.

Of the Aids du-Camp, Col. John Trumbull (Aid before Boston, in 1775,) alone survives the long and honored list of Millin, Reed, Johnson, Bland, Taylor, Grayson, Smith, Fitzgerald, Meade, Pinckney, Hamilton, Laurens, Humphries, Cobb, Tilgham, &c., &c. Trumbull, with the venerated Lafayette, from the time honored remains of the many and the worthy who were attached to the personal suite of the Commander-in-Chief in the days of trial.

Of the officers of the Guard, Coffax, Gibbs, Grimes, Nicholas, &c., all are stricken from the muster roll of Life—probably not a single soldier of the Body Guard now answers to his name.

Of the household of the first President of the United States, comprising from 1789 to 97, the Secretaries Lear, Humphries, Jackson, Lewis, Nelson, Craik, Dandridge, all are gone! The two adopted children, Mr Custis, of Arlington, and Mrs. Lewis, of Wood Lawn, are all that exist of Washington's family at the outset of the present Government. Not a servant of that period is living, although one, a very aged female, still lives who was at the camp of Morristown, 1777, and the Valley Forge, 1777-S. Such is the unsparing scythe of time!

The Clara Polder, containing 12 or 13 of the finest farms in the country, from 100 to 500 acres each, was lately totally inundated by the tide, through the opening which the Dutch have made in the sea-dike to the east of the Capitale-Dam. The damage is incalculable. One thousand five hundred acres of the finest land in Europe, the harvest in the barns, the crop of potatoes, the loss of which ruins above 100 families; the plantations, the buildings are all destroyed. The land will produce nothing for many years, and enormous expense will be necessary to stop a breach made between two creeks, and which will be widened and deepened in a frightful manner.—*London paper.*

King's property.—Louis-Philippe is the richest sovereign in Europe; his private revenue amounts to ten millions of francs a year,—about four hundred thousand pounds sterling. Next to him, comes the Elector of Hesse Cassel, who enjoys a revenue of seven millions of francs; the ex-King of the Belgians is supposed to have come third on the list. No just estimate can be formed of the fortunes of absolute kings. The Grand Sultan, Ferdinand of Spain, and Don Miguel, may be considered the wealthiest of monarchs, since the whole of the riches of their subjects is at their mercy.

Botanic Garden at Calcutta.—This establishment has been placed upon a footing surpassing anything of the kind known in Europe. The spot of ground is no less than five miles in circumference, and upwards of three hundred gardeners and laborers are employed in the charge of it; the superintendence of it is under the care of Dr Wallich, a pupil of the celebrated Horneman of Copenhagen.

On Sunday morning, the Robert Fulton, locomotive engine, arrived at Schenectady from Albany, in forty minutes, with a train of eight cars, containing 147 passengers and their baggage.

HINTS AND RECIPES IN DOMESTIC AFFAIRS.

Enjoyment is not found so much in luxurious as in simple dishes. Fried apples are better and more wholesome than expensive preserves.

Tortoise shell and horn combs last much longer for having oil rubbed into them once in a while.

A large stone, put in the middle of a barrel of meal, is a good thing to keep it cool.

Lumps will have a less disagreeable smell, if you dip your wick-yarn in strong hot vinegar, and dry it.

New England rum, constantly used to wash the hair, keeps it very clean, and free from disease, and promotes its growth a great deal more than Macassar oil. Brandy is very strengthening to the roots of the hair; but it has a hot, drying tendency, which N. E. rum has not.

Woolens should be washed in very hot suds, and not rinsed. Lukewarm water shrinks them. Suet and lard keep better in tin than in earthen.

Suet keeps good all the year round, if chopped and packed down in a stone jar, covered with molasses.

Legs of mutton are very good, cured in the same way as ham. Six pounds of salt, eight ounces of salt-petre, and five pints of molasses, will make pickle enough for one hundred weight. Small legs should be kept in pickle twelve or fifteen days; if large, four or five weeks are not too much. They should be hung up a day or two to dry before they are smoked.

A paulful of ley, with a piece of copperas half as big as a hen's egg boiled in it, will color a fine nankin color, which will never wash out. This is very useful for the linings of bed-quilts, comforters, &c.

Baked beans are a very simple dish, yet few cook them well. They should be put in cold water, and hung over the fire, the night before they are baked. In the morning, they should be put in a colander, and rinsed two or three times; then again placed in a kettle, with the pork you intend to bake, covered with water, and kept scalding hot for an hour or more. A pound of pork is quite enough for a quart of beans, and this is a large dinner for a common family. The rind of pork should be slashed.

Cider cake is very good, to be baked in small loaves. One pound and a half of flour, half a pound of sugar, a quarter of a pound of butter, half a pint of cider, one teaspoonful of pearl-ash; spice to your taste. Bake till it turns easily in the pans, I should think about half an hour.

To make Rice Bread.—Boil a pint of rice soft; add a pint of leaven; then three quarts of flour; put it to rise in a tin or earthen vessel until it has risen sufficiently; divide it into three parts; then bake it as other bread, and you will have three large loaves.

The editor of the Gloucester (Mass.) Telegraph trips up his notice of a very respectable military review, in his neighborhood, in the following happy manner:—'It was a bitter cold day,' and it was really comfortable to see several of the officers and soldiers on duty, clothed in their "Tom and Jerry's."—One company contained nine men, seven of whom were of the same name; another mustered eleven, and the officers, and so on.'

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, NOV. 2, 1841.

WORCESTER CATTLE SHOW.

The Massachusetts Spy, of the 26th ult. gives a detailed account of the Annual Agricultural Exhibition on the 20th, from which we have abstracted the following particulars.

The exercises in the Meeting-house, consisting of remarks from the President of the Society, Gov. Lincoln, a prayer from the Rev. Mr. Abbot and an Address by Dr. Fiske were listened to by a numerous assembly. The spirit and animation with which the venerable orator treated his subject secured the undivided attention of the audience, and the occasional sallies of humor that enlivened his speculations, were welcomed as pleasant accompaniments to substantial and valuable matter.

The following were among the sentiments offered:

Agricultural Societies.—The march of mind controlling the mass of matter. By their potent spells they have doubled the power of a prolific substance; and infused vitality into a caput mortuum—miracles incomprehensible to their opponents!

Our Spindles and Looms.—Though the day of Fable may have passed away, the thread of our nation's destiny is so interwoven with the thread of the manufacturer, that the hand which cuts the one, must sever the other also.

The Massachusetts Agricultural Society.—A Laboratory of Nature and Art. The science of its professors has compounded and combined principles unknown to the former, and their union has extended the vegetable creation beyond the sphere of her laws.

To this sentiment the Hon. John Welles, one of the Trustees of the State Society, responded in a few remarks, and the following toast:

The Worcester Agricultural Society.—Stifful, zealous, and indefatigable: their Show is every day and every where.

The Artisans, by whose ingenuity and skill the farmer is supplied with his improved implements of husbandry. By their contrivance and workmanship the curse of cultivating the earth by the sweat of the brow, is converted into the blessing of but a healthful perspiration.

Gold Dredging.—The best tools in the business, a plough and a hoe—the best place to seek for it, above ground.

New Hampshire.—While the traveller has gazed with delight upon the magnificence of her natural scenery, the world has admired the sublime exhibition of moral power in her distinguished Son, in sustaining the Constitution of his country.

This sentiment, referring to the celebrated speech of Mr. Webster in the Senate of the United States in defence of the Constitution, was received by the company with great enthusiasm, and elicited from that gentleman a train of eloquent and instructive remarks, in which, after thanking the Society for their allusion to himself and to his native State, he spoke of the means of agricultural improvement, and of the present condition and future prospects of the country. It would be useless to attempt even a sketch of the admirable views on the different topics embraced in his observations, nor would it be possible to convey an adequate idea of the manner and tone with which he descanted on the causes that threaten the permanence of the Union. We venture to say there was not a person present who did not partake of the deep and intense emotion so perceptible in the speaker himself, during this portion of his remarks.

After Mr. Webster sat down, sentiments were offered which called up successively Messrs E. Everett, Greenell, Dearborn, A. H. Everett, all of

whom responded in an appropriate and spirited manner. We regret our inability to give a more particular account of these contributions to the gratification of the company. The following were among the other sentiments offered:

The Farmer's Bank.—Its capital, industry—its dividends, competence and contentment.

Intemperance.—An unjust and arbitrary assessor, whom the farmer with a righteous indignation has reformed out of office.

The American Colonization Society.—Which has discovered the art by transplanting to produce a wholesome, from a noxious vegetation.

By Hon. O. Fiske (the Orator of the day).—A constituent ingredient of a good soil, and its best use in restoring cohesion to a loose and adulterated portion of the national farm—a superstratum of CLAY.

The Anti-Tariff Men of the South.—While they think so much of their rights, let them not expect we shall forget our water privileges.

By Gov. Lincoln, President of the Society.—Fidelity in public officers to the duties of their stations, and the submission of candidates to the will of the People.

By Hon. E. Everett.—The fidelity of the People to those public servants, who have ably and faithfully promoted the interests of the State.

The last toast followed on the heels of the Governor's, and being understood to allude to His Excellency, was welcomed with loud demonstrations of the concurrence of the company in the justice of the application.

By the Hon. John Welles.—*The Orator of the day*.—Whose wisdom is always instructive, and cannot be too often repeated.

By a Tariff man.—From the day of Adam until now it hath been said to man, 'Thou shalt labor for thy bread.' The present doctrine is, 'Thou shalt not labor, but buy.'

By a stranger.—Whatever we may say to the doctrine, that all is fair in politics, we shall readily acknowledge that all is fair in Worcester.

The political cultivators of the national homestead.—Who have shown by a recent experiment that most work may be done 'in breaking up' by ploughing with the heifers.

The good old days of beef broth and bean porridge.—A rich and substantial diet, which gave strength to the farmer to subdue a rugged soil; and courage to defend it. His luxury was to live within his means and pay his debts.

Farmer's Pens and Scholar's Pens.—As we have seen and heard them today; the sources of supply to the wants of man—the one feeding the body, the other the mind.

Horiculture.—The art of removing half the primitive curse of man. If it cannot restore him back to the old Eden, it can make a new Eden bloom around him where he is.

Season for Ploughing.—Land which is composed in part of clay, or what is called a stiff soil, should be ploughed in the fall and laid as light as possible, so as to expose it to the action of frost, which will pulverize and subdue it; and insects will then be destroyed by exposure to the rigors of winter. But arable land, which is sandy and porous should lie and consolidate till spring.

A good pickle for Beef and Pork called the 'Knickerbocker Pickle'.—Take 6 gallons Water—9 lbs. Salt, coarse and fine mixed—3 lbs. Brown Sugar—3 oz. Salt Petre—1 oz. Pearl Ash, and 1 gallon Molasses.

In making a larger or smaller quantity of pickle the above proportions are to be observed. Boil and skin these ingredients well, and when cold, put them over the beef or pork.

Fattening Swine.—Hogs will fatten the faster if they can have access at will to charcoal, which they will eat eagerly, and thus acquire an appetite for food, and escape a certain disorder, which bleds called dyspepsia.

Horticultural Hall,
Saturday, October 22.

FRUITS EXHIBED.

Apples.—By Mr R. F. Phipps of Charlestown, specimens from a French dwarf tree under the name of Royal French Pippin; another specimen from a French dwarf, name unknown.—By Mr Samuel Parker of Reading, specimens of two varieties of apples, one called *Rusty Red*, and to appearance a fine sized winter fruit—the others to appearance were fine Baldwin apples, both gathered from the same limb of the *Rusty Red*.

Pears.—By Maj. E. Crafts of Roxbury, beautiful specimens of Pajse Colmar of delicious flavor, scions from the trees received by the Hon. Mr Lowell from Mr Knight.—By Mr Manning, Pears supposed to be the Ambrette, but not of Cox; Louise Bonne of Duhamel; also pears name unknown, from the garden of Wm. Pettyplace, Esq. of Salem, a melting and fine flavored fruit.—By Mr E. W. Richards, Warden Pears, a good baking fruit and great bearer; also the Ambrette of Cox.—By Mr R. F. Phipps, Rousseline, Long Green Winter, Royal Winter of very fine flavor; the two last named were from trees imported from Vilmorin, Andrieux & Co.; also a pear of middle size and of excellent flavor, from another tree imported from the same source called the *Marquis*, but incorrectly.

Grapes.—By E. Bartlett, Esq., beautiful specimens of the following: White Chasselas, Royal Chasselas, Musk Chasselas, Petit Muscat, Gros Maroc.—By Mr William Emerson, Meunier or Miller's Burgundy.

Persimmons, from the Mount Vernon estate, Virginia, were exhibited by Mr B. V. French; the trees were stated to be ornamental and loaded with the fruit, which is very agreeable to the taste after severe frosts.

Mellors, from the garden of Mrs Parmentier, Brooklyn, N. Y., said to be very palatable after being ameliorated by frost.

For the Committee, WM. KENRICK.

ROTARY PUMP.—Messrs Hale, Crane & Co. of this city have obtained a patent for, and established a manufactory of, a new rotary pump which promises to be a decided and valuable improvement. Two wheels are inclosed in a casing which corresponds with them in size and which fits closely upon their sides. One of the wheels has, on its periphery floats or wings three in number, at equal distances apart—somewhat like cogs;—the other wheel has cavities into which the cogs or floats may fall, both wheels being so placed in their casing as to revolve together, and their peripheries forming a water-joint. Through the ends or heads of the casing pass the shafts which support and turn the wheels. There are two apertures in the casing, through one of which the water is drawn up by the suction produced by the motion of the floats, as they revolve from the wheel containing the cavities, and through the other the water is discharged, by the approach of the floats towards it. The pump may be put in motion by the

*To those who doubt the correctness of the theory advanced by Mr Knight, that the different varieties of fruits have their periods of existence fixed, and that after a certain time comes on their old age, their declension and total annihilation, it may appear a remarkable circumstance that the Royal Winter, the Virgouleuse, the Chaumelle, the Colmar and some others, the finest of all Pears, should have simultaneously and totally disappeared, or nearly so, from both the Boston and Paris markets. From this fact, which is from the most authentic and unquestionable source, we infer that out of that city, and in its vicinity, the country around, these ancient and once famous fruits are as liable to blast, and as unworthy of general cultivation as in the country around Boston.

W. K.

N. B. The Parsnip Seed left by Mr VAUGHAN is to be distributed next Saturday. Also, a new variety of Beans from Hon. SAMUEL LATHROP.

hand, or other power. One 14 inches in diameter with the application of the power of two men, will raise and discharge 180 gallons per minute. A pump of this size is already in successful operation at the Simsbury mines in this State; and orders for others have been received from several States in the Union.—*N. Eng. W. Review.*

[We have seen a model of this Pump, and are much pleased with the simplicity and ingenuity of the invention, and believe it will be found a valuable acquisition to the useful arts. We are informed that some of these Pumps will soon be left for sale at the Agricultural Warehouse, Nos. 51 and 52 North Market Street, Boston.]

*. Several communications are deferred till next week.

Fruit Trees, &c.

As the season for transplanting Trees is approaching, the subscriber offers at his Nursery, near the Court House in Worcester, the most approved variety of Apple, Pear, Cherry, Peach, Apricot, and Plum Trees, of good size and vigorous growth. Also, Horse Chestnut, and Catalpa Trees, for ornament and shade; Isabella and other Grape Vines; Honeysuckle, Strawberry Vines, &c.

Also, Mulberry Trees of good size, for transplanting, which may be had after a few days' notice, from another Nursery. O. FISKE.

Worcester, Oct. 19.

Nov. 2.

Grape Vine Plants,

For sale at the garden of S. G. Perkins, in Brookline, on the most favorable terms. The plants may be seen and purchased at the Garden at any time; or orders may be left with Mr Perkins at his office, corner of State and Congress streets.

The vines are from one to four years old, in fine order, with wood enough of this year's growth attached to most of the plants to make a dozen or more vines.

Chasselas, common white, or Muscadine.
Chasselas de Fontainebleau, or *Thomery*.
Chasselas d'Or, Bar Sur Aube.
Chasselas, red.
Chasselas, Muscat.
Black Hamburg.
Black Cape.
Expensive, black.
Frankendel, do.
St Peter's, do.
Zinfandel, by some called the Black Prince; the bunches produced on this vine are very large.

Isabella.
Muscat of Alexandria.
Muscat, red.
Muscat, Grizzly.
Muscat, white frontonao.
Muscat, purple.
Constantia—the sweetest of all Grapes, and a great bearer; the berries contain but one seed—generally, and sometimes none at all. SAMUEL G. PERKINS.

Nov. 2.

Buckthorns.

Gentlemen in want of this valuable plant for live fences can have young quicks about 3½ feet high, for \$3 per hundred, and plants 2½ feet high, for \$2.50 per hundred, by leaving their orders at the office of the New England Farmer. They are raised in the vicinity of Boston, are in the very finest order, and will be well packed. A small charge will be added for freight.

Nov. 2.

Cobb's Treatise on Silk.

Just published, and for sale at the Agricultural Warehouse and Seed Store, No. 50½ North Market Street, A Manual, containing information respecting the Growth of the Mulberry Tree, with suitable Directions for the Culture of Silk.—In three parts—with colored engravings. By J. H. COBB, A. M. Published by direction of His Excellency Gov. Lincoln, agreeably to a Resolve of the Legislature of Massachusetts. Price 37½ cents. Oct. 26.

Ammunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. If Jan.

Splendid Bulbous Roots.

Just received at the Agricultural Warehouse and Seed Store, No. 50½ North Market-street, direct from Van Eeden & Co. Harlem, Holland, a large assortment of Bulbous Flower Roots, comprising the finest varieties of HYACINTHS—(double and single)—dark blue, porcelain blue, red, rosy colored, pure white with yellow eyes, white with rosy eye, and yellow with variegated eyes; from 12½ cts to \$100 each.

TULIPS—splendid variegated, red, yellow and mixed, 12½ cts each \$1 per dozen, (our importation of fine tulips is very large, and we are enabled to put some sorts as low as \$6 per 100—an object to those who wish to form a superb tulip bed.)

CROWN IMPERIALS—assorted, of the most splendid colors, and showy flowers, large roots, 25 to 38 cts each, (extra fine roots.)

JAQUILLES—sweet scented, finest roots 12½ cents each.

POLYANTHUS NARCISSUS—fragrant, white with citron cups, extra sized roots, 25 cts each

DOUBLE NARCISSUS—fragrant, of all colors, 12½ cts each—per dozen, \$1.

SPRING CROCUS—of all colors, 64 cts each, 50 cts dozen.

PODIOPHYLLUM PELTATUM—(a most singular production, fruit bearing and medicinal) 12½ cts each.

The above roots are from the same house from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bulbs 1 inch and 8 10ths in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers.

Also, a further supply of Bulbous Roots, comprising Large White fragrant Lilies, 12½ cts each, 1 dollar per dozen, Tiger (spotted) Lilies, same price, Martagon or Turk's Caps Lilies, same price. If

BRIGHTON MARKET—Monday, Oct. 31.

[Reported for the Chronicle and Patriot.]

At Market this day 1477 Beef Cattle, 1393 Steers, 4332 Sheep, and 1883 Swine.—1000 Swine, and about 400 Sheep have been before reported.

PRICES.—Beef Cattle.—We quote for several years extra \$5 25, prime at 4 75 a 5, good 4 25 a 4 50, thin 3 a 4. Borrelling Cattle—Mess \$3 84, No. 1, 2 33, No. 2, 2 88 a 3 17.

Working Oxen.—A few sales only noticed at \$55, 62, 67 and 73.

Cows and Calves.—We noticed sales at 16, 19, 20, 22, 25 and 28.

Stores.—Sales were made of a large number two year old at \$1 15, yearlings at 6 a 9.

Sheep.—Dull, and prices somewhat reduced; a few store sheep were sold, price not known, lots to be slaughtered at 1 75, 1 85, 2 2 10, 2 25 and 2 50; wethers at 3 a 3 75.

Swine.—One entire lot of 620 was taken at 23½, one lot of 150 at 4c, one of 60 selected at 4½; at retail a 4½ for Sows, 5 a 5½ for Barrows.

New York Cattle Market, Oct. 24.—At market 1100 to 1200 Beef Cattle, 2500 to 3000 Sheep, 250 Swine, 50 Milch Cows. A considerable number of Cattle and Sheep left unsold. Sales were, for extra Beef Cattle 6 50 a 6 75; good 6 a 6 25; fair 5 a 5 25, and Middlewags 4 75 per cwt. Sheep, selected wethers 85; extra 1 50 a 1 75 at 3 a 3 50; fair 3 25 a 3 50, and ordinary at 1 50 a 1 75 each. Swine 4 a 4 5c. Milch Cows dull, 20 a 25 and 20. Pork in hogs \$6 a 6 50 per cwt.—V. I. D. a 2c.

In the New York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

From the United States Telegraph.

The following *Chronological List* of the principal Officers of the United States Government under the Constitution, has been compiled from authentic sources, and may be interesting to many, as a convenient document for reference.

PRESIDENTS.

- 1789, George Washington, of Virginia.
1797, John Adams, of Massachusetts.
1801, Thomas Jefferson, of Virginia.
1809, James Madison, of Virginia.
1817, James Monroe, of Virginia.
1825, John Q. Adams, of Massachusetts.
1829, Andrew Jackson, of Tennessee.

VICE PRESIDENTS.

- 1789, John Adams, of Massachusetts.
1797, Thomas Jefferson, of Virginia.
1801, Aaron Burr, of New York.
1805, George Clinton, of New York; died April 20, 1812.
1813, Elbridge Gerry, of Massachusetts; died Nov. 23, 1814.
1817, Daniel D. Tompkins, of New York.
1825, John C. Calhoun, of S. Carolina.

SECRETARIES OF STATE.

- 1789, Thomas Jefferson, of Virginia.
1794, Edmund Randolph, of Virginia.
1795, Timothy Pickering, of Pennsylvania.
1800, John Marshall, of Virginia.
1801, James Madison, of Virginia.
1809, Robert Smith, of Maryland.
1811, James Monroe, of Virginia.
1817, John Q. Adams, of Massachusetts.
1825, Henry Clay, of Kentucky.
1829, Martin Van Buren, of New York.
1831, Edward Livingston, of Louisiana.

SECRETARIES OF THE TREASURY.

- 1789, Alexander Hamilton, of New York.
1795, Oliver Wolcott, of Connecticut.
1801, Samuel Dexter, of Massachusetts.
1802, Albert Gallatin, of Pennsylvania.
1814, George W. Campbell, of Tennessee.
1814, Alexander J. Dallas, of Pennsylvania.
1817, William H. Crawford, of Georgia.
1825, Richard Rush, of Pennsylvania.
1829, Samuel D. Ingham, of Pennsylvania.
1831, Lewis M'Lane, of Delaware.

SECRETARIES OF WAR.

- 1789, Henry Knox, of Massachusetts.
1795, Timothy Pickering, of Pennsylvania.
1796, James M'Henry, of Maryland.
1800, Samuel Dexter, of Massachusetts.
1801, Roger Griswold, of Connecticut.
1801, Henry Dearborn, of Massachusetts.
1809, William Easton, of Massachusetts.
1813, John Armstrong, of New York.
1815, William H. Crawford, of Georgia.
1817, Isaac Shelby, of Kentucky, (did not accept).
1817, John C. Calhoun, of S. Carolina.
1825, James Barbour, of Virginia.
1828, Peter B. Porter, of New York.
1829, John H. Eaton, of Tennessee.
1831, Lewis Cass, of Ohio.

SECRETARIES OF THE NAVY.

- 1798, George Cabot, of Massachusetts.
1798, Benjamin Stoddert, of Maryland.
1802, Robert Smith, of Maryland.
1805, Jacob Crowninshield, of Massachusetts.
1809, Paul Hamilton, of S. Carolina.
1812, William Jones, of Pennsylvania.
1815, Benj. W. Crowninshield, of Massachusetts.
1818, Smith Thompson, of New York.
1823, Samuel L. Southard, of N. Jersey.
1829, John Branch, of N. Carolina.
1831, Levi Woodbury, of New Hampshire.

*This department was not established until the 30th of April, 1798, being prior to that date a branch of the War Department.

POSTMASTERS GENERAL.

- 1789, Samuel Osgood, of Massachusetts.
1791, Timothy Pickering, of Pennsylvania.
1795, Joseph Habersham, of Georgia.
1802, Gideon Granger, of Connecticut.
1814, Return J. Meigs, of Ohio.
1823, John M'Lean, of Ohio.
1829, William T. Barry, of Kentucky.

Chief Justices of the Supreme Court.

- 1789, John Jay, of New York, appointed.
1796, William Cushing, of Massachusetts.
1796, Oliver Ellsworth, of Connecticut.
1800, John Jay, of New York.
1801, John Marshall, of Virginia.

Attorneys General.

- 1789, Edmund Randolph, of Virginia, appointed.
1794, William Bradford, of Pennsylvania.
1795, Charles Lee, of Virginia.
1801, Levi Lincoln, of Massachusetts.
1805, Robert Smith, of Maryland.
1806, John Breckenridge, of Kentucky.
1807, Caesar A. Rodney, of Delaware.
1811, William Pinkney, of Maryland.
1814, Richard Rush, of Pennsylvania.
1817, William Wirt, of Virginia.
1829, John M. Berrien, of Georgia.
1831, Roger B. Taney, of Maryland.

Speakers of the House of Representatives of the United States.

- 1789, First Congress, 1st and 2d sessions held at N. York; 3d session at Philadelphia; Frederick A. Muhlenburgh, of Penn.
1791, Second Congress, held at Philadelphia; Jonathan Trumbull, of Connecticut.
1793, Third Congress, held at Philadelphia; Frederick A. Muhlenburgh, of Penn.
1795, Fourth Congress, held at Philadelphia; Jonathan Dayton, of New Jersey.
1797, Fifth Congress, held at Philadelphia; Jonathan Dayton, of New Jersey.
1799, Sixth Congress, 1st session at Philadelphia, 2d at Washington; Theodore Sedgwick, of Mass.
1801, Seventh Congress, held at Washington; Nathaniel Macon, of N. Carolina.
1803, Eighth Congress; Nathaniel Macon, of North Carolina.

A young Russian Nobleman, travelling in Germany, struck with great violence the postillion who drove him. "Take care," said a bystander, "you will kill him!" "Oh, as for that matter," said the Russian, "I am rich enough to answer for it. What do they charge for postillions in this country?"

FRUIT TREES.

For sale at the KENRICK NURSERIES, in NEWTON, near Boston, a most extensive assortment of Apples, Pears, Peaches, Plums, Cherries, Apricots, Nectarines, Almonds, Mulberries, Quinces, Raspberries, Gooseberry and Currant bushes, Grape Vines of the best foreign sorts, and 25 finest varieties of Strawberries, including the most rare, productive and esteemed.

Also about 400 varieties of the most hardy ornamental trees and shrubs, and superb hardy roses, including Silver Fire, varieties of Spruce, Flowering Horse Chestnuts, Flowering Catalpas, Mountain Ash with beautiful clusters of red berries in autumn and winter, Purple Acacia, Three Thorned and Thornless Acacia, Butternuts, Ailanthus or tree of Heaven, Elms, American and Scotch, Sugar Maples, Weeping Willows, do. do. Napoleon from St Helena tree, Honey suckers. Many of the above sorts of trees of extra sizes, for ornamenting highways and commons.

WHITE MULBERRIES, genuine sort for silk worms, by the 100 or 1000 for Plantations.

ISABELLA and CATANA Grape Vines, either singly or at reduced prices by the 100 or 1000.

CHINA ROSES, CHINESE CHRYSANTHEMUMS, GERANIUMS, &c. &c.

Written orders addressed either to JOHN or WILLIAM KENRICK, NEWTON, are regularly received by the daily mail, and will be promptly attended to, or they may if more convenient be left with J. B. Russell, at the New England Farmer office, where also, catalogues may be obtained gratis on application. But purchasers are invited when convenient to call and examine the trees, &c. for themselves, and make their own selections; but when this is not convenient, then let them forward their orders, relying that the very best possible selection will be made for them. Trees when destined for a distant place, are carefully packed either in clay or moss, and mats, and delivered whenever ordered in Boston free of any charge for transportation. eptD1 Oct. 19.

Farm Wanted.

Wanted to purchase, or hire, a good Farm within seven miles, south or west of Boston, containing forty to eighty acres of land, with general dwelling house, good barn, &c. Apply to J. B. Russell, Farmer office, Boston—it by letter, post paid. If Oct. 19.

Pear Seedlings.

For sale at the Agricultural Warehouse, No. 52 North Market Street—

PEAR SEEDLINGS, of vigorous growth, and promising appearance, raised within six miles of Boston, in fine order for nurseries—the largest size are from 18 to 21 inches in length, the whole plant; price \$10 per thousand; the second size from 12 to 18 inches in length, price \$8 per thousand. They will be suitably packed as wanted, for transportation to any distance. Oct. 19.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

Printed for J. B. RUSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for printing received by J. B. RUSSELL, at the Agricultural Warehouse, No. 52 North Market Street. AGENTS:

COMMUNICATIONS.

ICE HOUSES.

MR FESSENDEN—Your correspondent C. whose communication was given vol. x. page 13 of the New England Farmer, complains of not being able to keep his ice through the summer, and imputes it to the soil on which his house is located. I have an ice house, which is built on the same kind of soil, which he describes, say a gravelly knoll. I dug a pit, say from 8 to 12 inches larger than I intended the frame. I dug it about 8 feet below the surface, and with the gravel, which came out of the pit, I raised it about 2 feet. My frame was 10 feet long, 8 feet wide and 10 feet deep. I planked it up with 2 inch hemlock planks, and filled the space on the outside, which was from 8 to 12 inches, with tan, and rammed it down as fast as I planked it up till I came to the top of the frame. I then put on rafters of joists 4 or 5 inches square, and lined them and filled the space with tan, as tight as it could be rammed in, and then shingled the roof. The ends were boarded up, with a door at each end, for the convenience of filling the house. My house holds about 6 cords. I fill it with square pieces of ice, as close as I can pack them. I put nothing between the layers of ice, nor on the sides, nor do I break any in pieces to fill up the spaces, except broken pieces that will not make good stowage. I have filled the house to the top of the frame. I then fill the roof with shavings, and ram them down as tight as I can. I have had no difficulty in keeping my ice, and have spared as much as we have used, and have often ice in the house, when we clear it for filling afresh. I think shavings are better than straw, as they will not rot so soon by the dampness. I go to the ice house at any time of day, when ice is wanted. My ice house has no drains to it. Under the plank at bottom I rounded out a place lengthwise, about a foot deep, sloping towards the middle like an egg, cut in two lengthwise, which I think is sufficient to receive all the water that will waste from the ice. Remain with respect,

Your most obedient servant,

Medford, Oct. 25, 1831. A SUBSCRIBER.

We are personally acquainted with the writer of the above, who is a respectable and intelligent agriculturist in the neighborhood of Boston. We regret that he did not authorize us to add his name to his useful article.—Editor.

SUN FLOWER OIL.

To the Editor of the New England Farmer.

DEAR SIR—I have read several articles in different newspapers, respecting the value of sun-flower seed, for the purpose of producing oil. The favorable manner in which this article was spoken of induced me to make a trial myself. Accordingly last spring I planted nearly one half of an acre, the produce of which was thirty bushels of good seed. So far the success was equal to my expectations. Last week I took a quantity to the oil mill of Mr Smith in Ipswich, and the most we could procure from a bushel was two quarts. We at first made several trials by grinding and pressing, but in this way the most we could get was one quart and a half-pint, from one bushel. We then heated the seed, and pressed without grinding, but

did not succeed so well; we then ground and pressed cold and procured two quarts, and this was the most we could procure in any way.

My object in making this statement, is to correct any wrong impressions that have been made, respecting the value of this article. By the above experiment I am certain it has been overrated by at least one half.

After such a decided failure I do not feel much disposed to boast about raising sun-flowers, but will just observe that mine were mostly of the single headed kind, and some of them measured upwards of four feet in circumference.

I presume the cause why it did not produce as much when hot pressed as cold, was that the hull of the seed when hot absorbed the oil more readily

Yours respectfully, JOSEPH MANN.

CORN STALKS—AGAIN.

MR EDITOR—I have no inclination for a corn stalk controversy, but beg leave to add the following to my communication of Sept. 28. Your correspondent from South Boston supposed my communication calculated to mislead, &c. I should exceedingly regret any such result. I have read his statement with much interest, but still remain in the dark on certain points. He states that 'cows when fed with stalks must be fed to the full, that they must be satisfied or they will stand all day impatiently watching the cornfield,' &c, and 'that they will neither eat grass nor drink water, so long as they expect anything better.' This is doubtless true, but with my cows the case was of a different character. To avoid the above evil my cows were fed with stalks late in the afternoon and another time. They appeared to feed as usual through the day, until near the time for stalks, and when they sometimes arrived half an hour or soon, I repeatedly noticed that they found employment at feeding as before. Now if a full supply of stalks will greatly increase the milk, why should a small quantity in addition to the usual supply of grass diminish it? This is the main point concerning which I am in the dark. That my cows consumed more food, in all, on those days when fed with stalks, than before or after, I cannot for a moment doubt; and if it be a fact that grass feeding ceases to nourish the animal when her thoughts are on the corn stalks, it is certainly a fact of no small importance to the farmer. The quantity of stalks consumed by my cows as stated before, was four hills each, per day, a small pittance to be sure, but considering the luxuriant growth of the season, including an abundance of suckers, not so scanty as might be at first supposed.

It is much to be regretted that farmers (as they are called) are so much inclined to follow an old practice, taking it for granted that it is a good one. Few on this point perhaps have been more genuine than myself. But in the corn stalk business think there are very many who have done as such as I have, feeding in this small way, the whe of which, so far as my late experience proves anything, is an entire loss and something worse

into the bargain. If the best, and only successful mode of feeding, is to give them as many stalks as they will eat up clean at one time (and I do not presume to doubt it,) it is certainly time for farmers to attend to the subject; for if this theory be correct, I am persuaded there are hundreds in Massachusetts sustaining yearly loss, and though some may think even green stalks a dry subject, on paper, I cherish a hope that the above may excite further investigation and eventually benefit some others beside.

Your obedient servant,

Newton, Oct. 14, 1831. E. F. WOODWARD.

FOR THE NEW ENGLAND FARMER.

PRODUCTIVE CULTIVATION.

MR FESSENDEN—To number the most acres, or to see who shall possess the largest domain ought not to be the chief ambition of the agriculturist, but to strive for excellence in the cultivation of what land a man may already have in possession; to see who can make the most at the least expense, from the fewest acres; to make two and even twenty spears of grass grow where none before vegetated.

If such a strife for excellence were encouraged, we should see the man of few acres proudly standing by the side, yea lifting his head higher than his more aced neighbor. To encourage a competition of this kind, and to show what may be raised on a small spot of ground, I give below the produce of one acre, three years in succession, belonging to B. Norris, Esq. of this town, the truth of which can be abundantly verified, if required,

Yours &c,

L. W. B.

Bristol, R. I. Nov. 2, 1831.

1829,

12178 bunches of onions, at 60 bushels to the thousand bunches, a common average, would be

730 bushels of Onions.

GRAPES.

MR ESSENDEN—I have the past season, made an experiment on a fine White Sweet Water Grape (a vine somewhat extended.) As soon as the grape became two thirds grown, I picked off the leaves partially, in order to admit the sun to the fruit, presuming that it would be benefited by it, but much to my surprise it soon *blasted, cracked open and withered*, while on other parts of the vine the clusters were large, and the grapes of full size and of a delicious flavor. From this it appears evident that it is a great injury to remove the leaves, as the clusters most secluded were the largest and finest grapes. From this vine which is now 5 or 6 years old I had more than half a bushel of the most delicious grapes, and had I not removed the leaves from a considerable portion of the same, I should have probably had a peck more. If this information is of any value to others interested in the culture of this fine fruit you will please mention it, as you have fully evinced your desire to promote the great interests of agriculture and horticulture.

Yours truly, L. JENKINS.

Canandaigua, N. Y. Nov. 2, 1831.

EXTRACTS FROM AN ADDRESS,

DELIVERED BY THE HON. EDWARD EVERETT, BEFORE THE AMERICAN INSTITUTE, OCT. 12, 1831.

Your society, gentlemen, was incorporated for the purpose of encouraging and promoting domestic industry in this State and in the United States, in Agriculture, Commerce, Manufactures and the Arts? The legislature of New York evidently had in view, in thus stating the object of your institution, the great subordination which it is usual to make of the industrious pursuits of man.

It is usual to divide the industry of a country, into the three great branches of commerce, agriculture, and manufactures. There are of course some important pursuits, such as mining and the fisheries, which do not exactly fall under either head. It is the great business of agriculture, to produce the food to be consumed by the community, and a part of the materials used for manufactures. The manufacturer works up the raw materials and natural products, of domestic and foreign growth, into various fabrics and articles for the use of man; and commerce carries on the necessary exchanges, between the farmer, the manufacturer, and the consumer, in different parts of the country, and between the whole community and foreign countries. That country is the most prosperous, which under good laws and a wise administration of them at home, and in the enjoyment of an intercourse on liberal principles, with foreign nations, possesses these three branches of industry in their due proportion to each other; so that all flourish together; and neither languishes that the rest may thrive.

These three great branches of industry are all, in the highest degree, important, and entitled to the favorable regard of the whole community. If we wish to form comparisons between them, (which however ought not to be done, without recollecting that they are very intimately connected together and dependent on each other) we should pronounce agriculture the most important branch,—manufactures the next, and foreign commerce the least important of the three. It was calculated four years ago in Great Britain, that the

annual amount of the grain grown in that country, (including wheat, oats, barley, rye and pulse) was 112,000,000; and that the amount of cattle, sheep, hides, wool, butter, cheese and poultry, was about as much more, making together more than a thousand million of dollars. At this rate, the whole national debt of Great Britain, vast as it is, would not exceed five crops. If we suppose the population of the United States to amount to 13,000,000, and allow half a dollar a week as the entire expense of the agricultural produce, consumed as food and clothing by each individual, it will amount to near three hundred and forty millions per annum. Besides this, there is the food consumed by domestic animals; there is the agricultural produce, consumed for other purposes than food and clothing;—and there is the entire accumulation, or what is raised and not consumed:—an aggregate, I presume, of \$1,000,000,000.

The value of the manufacturing industry of the country is less easy to estimate; but it is vastly great. Articles scarcely thought of, in taking a general view of the occupation of the country, can be easily shown to amount, in the aggregate, to a prodigious sum. It has been lately calculated, that the manufacture of hats, in the United States amounts to \$13,000,000 annually, and that of boots and shoes to \$26,000,000. This would make the amount of hats equal to more than half the export of the great staple of cotton; equal to twice the rice and tobacco exported; and to twice the amount of the entire sugar crop. The article of boots and shoes at 26,000,000 would exceed the average of the exportation of cotton, for the last twelve years.

The amount of our foreign commerce, as consisting in the export of domestic produce, is not greatly over \$60,000,000. This is of course the product of agriculture and manufactures; and bears but a small proportion to the domestic consumption.

It was probably the consideration of facts like these, which led Adam Smith to the following train of remarks:

The capital that is acquired to any country by commerce and manufactures, is all a very precarious and uncertain possession, till some part of it has been secured and realized, in the permanent improvement of its lands. A merchant, it is here said very properly, is not the citizen of any particular country. It is in a great measure indifferent to him, from what place he carries on his trade and a very trifling disgust will make him move his capital and with it all the industry, which it supports, from one country to another. No part of it can be said to belong to any particular country, till it has been spread, as it were over the face of that country, either in buildings or the long improvement of lands. No vestige now remains of the great wealth said to be possessed by the eastern part of the Hanse towns, except in the obscure histories of the thirteenth and fourteenth centuries. It is even uncertain, where some of them were situated, or to what towns in Europe the Latin name given to some of them belong. But though the misfortunes of Italy, at the end of the fifteenth and beginning of the sixteenth centuries, greatly diminished the commerce and manufactures of the cities of Lombardy and Tuscany, those countries still continue to be amongst the most populous and best cultivated in Europe. The civil wars of Flanders and the Spanish government which succeeded them, chased away the real

commerce of Antwerp, Ghent and Bruges. But Flanders still continues to be one of the richest, best cultivated, and most populous provinces in Europe. The ordinary revolutions of war and government easily dry up the sources of that wealth which arise from commerce only. That which arises from the more solid improvements of agriculture, is much more durable, and cannot be destroyed, but by those violent convulsions, occasioned by the depredations of hostile and barbarous nations, for a century together; such as happened for a century before and after the Roman empire, in the western provinces of Europe.*

In descending to the particulars of the laws, which it may be necessary to enact in any country, for the purpose of building up and protecting the arts and industry of the people, they must depend partly on the legislation of foreign countries, and partly on the nature of the case. It is commonly considered, that it would be an advantageous intercourse, to exchange, without restriction, the products of agriculture in one country for those of manufacturing industry in another. But if the foreign manufacturer refuse to be fed by the agricultural produce of the consumer, who consumes his fabric, it is absolutely necessary, by a judicious legislation, to rear up a class of domestic manufacturers, who will make the exchange.

The necessity of such a legislation is farther made manifest, by considering the nature of many of the manufacturing arts. They require great experience in constructing machinery—a great outlay of capital,—and practice in all the various processes required for the production of the fabric. How much of this skill is required can only be estimated by a person who will visit a cotton mill,—and commencing from the machine-shop trace the progress of the factory from the first revolution of the lathe, by which the spindle is turned, to the completion of the building, and from the opening of the bale of cotton to the packing up of the bale of cloth. This skill is just as necessary to carry on a manufacture, as the machinery or the power that moves it. It is plain, that it must take some time to acquire it; and till it is acquired the infant manufacture cannot possibly sustain a competition with those establishments which possess the skill. So certain is this, that it has been stated, by one of the most popular writers on political economy in Great Britain, at the present day, that it is impossible that the United States should enter into competition with England, in the cotton manufacture, because Great Britain has the start of us in the requisite skill. When we reflect on the infinity of detail in the business of a great manufacture,—in the contrivance, construction and management of the machinery, the preparation of the raw material and the processes, for working it up;—and what an essential difference in the result, on a large scale, is produced by a very small advantage, in any of the parts, it is obvious that unless there were some protection against foreign competition in its infancy, no manufacture previously well established in one country, could be introduced into another. Accordingly I believe it may be asserted as a proposition to which there is no exception, that there is no example of a complicated manufacture, already existing in one country and introduced into another under a system of unrestrained commerce and without legislative protection.

Such protection is necessary to prevent the con-

dition of the laboring population in one country, from regulating the condition of the same class in all other countries connected with it. It is, scarcely necessary to state, that as the laboring population, in all countries, forms the mass of the community; and as their labor must be the chief source of the public wealth, the prosperity of the country depends on the condition of this part of the population. Where the laborer receives a generous portion of the products of his toil and skill, the country is prosperous; and it languishes where his share is mean and inadequate. In most of the countries of Europe the wages of labor are depressed to the point of a meagre subsistence. It is impossible therefore, *other things being equal*, that the industry of any other country should, without protection in the outset, enter into competition with that of Europe, till its labor is ground down to the same standard. It has been the object of the economical system of the United States, to secure to the labor of the country a just and equitable, but not an extravagant, portion of the products. Of this last evil, however, there is the less danger as it must of necessity be checked by that competition, which encouragement invariably produces. The moment a branch of industry is overpaid, it is thronged, till the compensation falls to the average of other pursuits.

CANADA COTTON.

A Montreal paper gives the following account of an experiment in spinning the wild Cotton in Canada.

Among the various plants which nature in her Canadian wildness produces in profusion, few have perhaps been considered of less value than that which by the Canadians is called Cottonier. Cart loads, may ship loads of its seed are blown away by the wind yearly, and yet that seed has now been ascertained to be convertible to a most useful and even important purpose. For this discovery the public are indebted to the observation and perseverance of the lady of Dr Stewart Chisholm, of Glenagry, in Upper Canada, who resolved upon making the attempt to spin some of the wild cotton, heretofore lost to any good purpose. This attempt has so entirely succeeded, that not only has Mrs Chisholm spun a very large quantity of the material, but has caused it to be woven into a sort of stuff, most valuable in this rude climate, for many purposes, in the habitant's and cottager's establishment. We have been favored with a piece of the manufactured stuff, cut from this web, and which all persons, desirous of so doing, will be welcome to inspect at the Herald Office.

Rail Roads.—The following paragraph from the Louisville Advertiser shows the confidence entered into by foreigners as well as Americans of the success of Rail Roads in this country.

Professor Dudley, of Lexington, Ky., who has been for some months past travelling in Europe, for the purpose of purchasing books, apparatus, &c., for the use of the Transylvania Medical College, has written, we understand, to a friend in Lexington, to increase his subscription of \$10,000 to the Kentucky Rail Road, to \$20,000. The Professor assures his friends in Lexington, that the whole amount of stock of the contemplated Rail Road would be readily taken in Europe. It is also stated, that he had been authorized by a Parisian capitalist to subscribe for him to the amount of \$30,000. The contracts for part of the road will be let out during the present month.

Lowell Railroad.—The location of this Railroad is nearly completed. The inclination of the road from the horizon, will not exceed in any part ten feet in a mile. It terminates in this city, near the entrance to Warren bridge, on the westerly side of the bridge. The road will enter the city by a viaduct to be erected across Charles river, east of the Canal bridge.

Machinery and Capital.—We copy the following extraordinary statement from the Mechanics' Magazine; it speaks volumes.—Mr Crawshaw's Iron Works.—Number of persons employed, 5,000. Annual sum expended for labor, £300,000. Number of horses employed, 450. Number of steam-engines, 8; each of 50 horse-power, but going night and day, doing the work of 21,000 horses.—Water wheels 9, equal to the power of 954 horses.—Furnaces, 81; each about 50 feet high and wide in proportion. Forges, 3.—Foundry, 1. Rolling mills, 8.—Boring mill, 1.—Annually used for mixing with the iron ore, iron stone, 90,000 tons, lime, 40,000 tons.—Annually consumed, coals 200,000 tons, gunpowder, 30,000 lbs., candles, 120,000 lbs.—One hundred and twenty miles of tram-railway have been laid down for the use of these works, besides which there is a canal of several miles, with aqueducts, bridges, &c.—Of tram wagons, made chiefly of iron, there are many thousand.—Mr Crawshaw has lately built a castle for his own residence in the vicinity of the works, which covers an area of 174 square feet, and contains 72 apartments; the locks and hinges alone cost £700.—There is a pinery attached to the castle, which is heated by steam, and costs £850 yearly; an extensive graperly also, that costs nearly as much.—*English paper.*

Canker Worm.—The Canker Grub is more abundant this fall than it has ever been known before, and if instant measures are not taken to prevent its ascent into the fruit trees, they can scarcely fail to be totally ruined next year. A mistaken notion has heretofore prevailed, that the grub did not ascend till the Spring; but the fact is, that it leaves the ground at this season, lays its eggs and dies, and the worms are hatched in the Spring. Much of the mischief, it is to be feared, is already done; but perhaps an immediate resort to tarring and other preventives may be beneficial.—*Salem Gazette.*

Mammoth Squash.—Raised this season by Mr. Task, of Fayette, Chautauque county, N. Y. A Squash, weighing *eighty-six pounds*, and measuring round five feet four inches and a half. It grew in the vicinity where the Big Black Walnut tree stood, which has so much astonished the European world, and is a fair specimen of the richness of the soil in the vicinity where they grew. Fayette not outdone by the natural and cultivated product of the soil.—*Fredonia Censor.*

An American Gourd.—There is a Gourd at the Museum, the growth of the present season, under whose shade a modern Jonah or even Goliath might repose. It measures five feet four and a half inches in circumference, and weighs fifty six pounds. It was raised in Hubbardston, by Mr Aaron Greenwood, nephew of the superintendent of the Museum, from seed brought by Mr Moses G. from a place 700 miles west of Little Rock in Arkansas Territory.—*Traveller.*

THE DOMESTIC CAT DIVING FOR FISHES.

Sir.—In reading that delightful little work of Mr White's, *The Natural History of Silborne*, the propensity of cats for fish, and their repugnance to wetting their feet, are remarked by the intelligent author. An anecdote or two of these beautiful but maligned quadrupeds, proving their piscivorous natures in the one case, and in the other a strong natural antipathy overcome by a still more powerful propensity, will perhaps be amusing to some of your readers, who like myself, have a regard for every thing which lives, and moves, and has a being. In the centre of my father's garden was a fish-pond, stocked with various kinds of fish. Many a time and oft have I witnessed puss (and a very pretty tortoiseshell puss she was, and a great favorite withal) watching at its brink for its finny inmates, and on their appearing at the surface darting on her prey, and in spite of the wetting and ducking she encountered, bringing them in triumph to the pond's edge, and regaling on the delicious fare. This sport, I believe, she continued in the enjoyment of till the day of her death; and so amused were we with her angling powers that no obstruction was ever thrown in her way. The pond, moreover, was not, as some may imagine, sloping in its bottom and picturesque in its appearance, but it was completely a cockney pond in its *tout ensemble*, octangular in its shape, of precise equality in its depth, with a pavement smooth and regular both in the sides and base; therefore, before this puss could gratify her taste, a plunge was to be taken which was sufficient to make the stoutest cat's heart tremble.

The other anecdote relates to a cat of more extraordinary acquirements, which belonged to one of my workmen. In a large and deep pond at my premises in the Green Lanes, a stock—not of fish, but of rats—had accumulated, the destruction of which was undertaken by this uncommon cat. He was daily in the habit, for nine or ten years, of stationing himself on the margin of the water, and of jumping into the liquid element on the appearance of his game. A day seldom closed unsuccessfully, and he has been seen and known to catch and bring from the watery deep four of these vile vermin betwixt sunrise and sunset. As I said, this amusement was kept up by him for the space of nine or ten years, in fact until his rat-catching powers deserted him: and when his teeth became all extracted in the performance of his daily feats, and his master had him killed, that the miserable death of starvation might not await him. This cat was truly a sportsman, and pursued the sport solely for the love of it; he caught his game with avidity, but never eat a morsel; so that the pleasure of the chase alone had charms enough in his mind to vanquish one of the strongest antipathies of his nature.—*Loudon's Mag.*

The editor of the Sporting Magazine, in his last number, gives the following advice, which may not be considered ill-timed, as on many large estates not a single Partridge survived the great snow of last winter:

Partridges.—It has been well suggested to put the question to all farmers and liberal sportsmen, whether it is not highly expedient to forbear the taking of Partridges altogether the ensuing season? By that means only can the ravages of the last winter be repaired. No genuine lover of the trigger will draw one upon a Partridge this fall. For ourselves we are determined not to buy or taste one until the fall of 1832.

Agricultural.

REPORTS

Of Committees at the Annual Meeting of the Bristol Agricultural Society.

ON WORKING OXEN.

The Committee on WORKING OXEN have attended the duty assigned them, and submit the following as their Report.

The whole number entered for premiums, was eighteen yoke. This is a larger number than has been entered at any previous year. Your Committee were highly gratified with the manner in which they performed. They displayed not only great strength in drawing, but great facility in backing and turning their loads, and a discipline, which required the whip to be used rather as a wand than as an instrument to inflict pain. There was scarcely a yoke that performed which did not merit a premium. One yoke of four years old oxen, belonging to Samuel A. Dean, appeared to great advantage. The limited number of premiums, however, offered by the Society, prevent the Committee from bestowing rewards where they were really deserved. This exhibition, it is believed, would not lose by a comparison with that of any of our neighbouring societies. After much consideration your Committee have awarded the following premiums, viz :

Bildad Burt, for the best yoke of oxen,	\$5 00
Horatio Leonard, 2d do.	4 00
Schuyler Shepard, 3d do.	3 00
Jesse R. Carpenter, 4th do.	2 00
Peter Thatcher, Jr, 5th do.	1 00
Luther L. Short, for the best yoke of three years old Steers,	4 00
John Padelford, 2d do.	3 00
Daniel Edson, 3d do.	2 00

SYDNEY WILLIAMS,
SETH HOGGES,
LEPRILETTE SWEET,
PETER THATCHER, } Committee.

ON STOCK.

The Committee on STOCK ask leave to report that they have awarded the following premiums :

To Israel Brayton, Somerset, best fat ox,	\$10 00
Nathan Slade, Somerset, 2d do. do.	8 00
Israel Brayton, Somerset, 3d do. do.	6 00
Jesse Carpenter, Attleboro', 4th do. do.	4 00
Abner Badley, Mansfield, best bull,	10 00
Justin Howard, Easton, 2d do. do.	7 00
Lucas Daggett, Attleboro', 3d do. do.	5 00
Benj. Shores, Taunton, best bull calf,	4 00
Artemas Stebbins, Swansey, 2d do. do.	2 00
S. B. King, Taunton, 5 best milch cows,	8 00
Nathaniel H. Williams, do. for 2d do. do.	6 00
Jesse Carpenter, Attleboro', 3d do. do.	3 00
Samuel A. Dean, Taunton, best heifer,	4 00
Edmund Porter, do. 2d do. do.	3 00
Elbridge G. Dean, do. 2d do. do.	2 00
John Sweet, Norton, best merino buck,	3 00
Peter Thatcher, Attleboro', 6 merino ewes,	3 00
John Sweet, Norton, 6 do. different breed,	3 00
Leprillette Sweet, Attleboro', best boar,	3 00
Julius Fisher, Taunton, 2d do. do.	2 00
S. B. King, do. best breeding sow,	3 00
Leprillette Sweet, Attleboro', 2d do. do.	2 00

As the Committee have no power to award premiums for horses, they recommend to the Society to allow Virgil B. Bucklin, of Seekonk, for a two years old stud, two dollars.

It not being convenient for the Committee at this time to enter so thoroughly as they could wish into the subjects committed to them, they merely take occasion to observe, that in some kinds of stock presented for premiums, particu-

larly fat Cattle, Sheep and Swine, there was less competition than was desirable. They trust, however, that there is no diminution of that general interest in the concerns of the Society which should characterize an agricultural community. Your committee may be permitted to remark that although the farmers of the County of Bristol have evinced less ambition of excellence in their agricultural operations than those of some other Counties in the State; yet, since the establishment of your Society there has been an evident improvement in the method of raising and managing stock, as well as in its general quality; and they observe with pleasure that many persons are willing to present for observation or imitation the productions of their care and enterprise, rather for the purpose of encouragement and information to others, than from regard to the premiums offered. The true object of Agricultural Associations and Exhibitions is to call forth a general interest and inquiry on the subjects which they embrace; and by presenting and comparing the results of individual experience to introduce a general improvement in the pursuits of husbandry. The man who obtains a premium for an animal derives little benefit from the amount of money received, compared with the advantage of learning how to raise and feed an animal deserving a premium. Much—almost everything depends upon raising Cattle from a good stock.—Our farmers, it is believed, pay less regard to the quality of domestic animals than their own interests demand. The additional expense of procuring breeding animals from a good stock is small, and an excellent breed once obtained is, whether for use or for the market, incalculably more valuable than an ordinary one. In a pecuniary point of view this subject deserves attention. The importation of foreign domestic animals has greatly contributed to improve our races of cattle in this country. It is known that for more than fifty years past great efforts have been made in Great Britain and France to improve the state of their horned cattle—while with us no such effort had been made. Of course it is to be presumed that those nations have improved their races, while ours have been stationary. If it should be admitted that the fine natural pastures on the beautiful, fertile, and moist hills of Worcester, that New England paradise for fine cattle, had kept up a race of cattle, vigorous, and nearly perfect in their forms, the same could not be attributed of Bristol, or of the Southern Counties, or of the northern part of Middlesex or Norfolk. There can be no doubt that our race of *Milch cows* is generally ordinary, and our cattle at large inferior to those of England, of the Netherlands and of Normandy. The introduction of Merino and Saxony sheep into this country has been attended with remarkable effects. Your committee regret that more attention is not paid to the raising and managing of sheep in this country, only 2 or 3ots were exhibited for premiums.

Some handsome specimens of swine were presented, and a great variety of valuable bulls from which the committee found it somewhat difficult to make selections for the premiums awarded.

All which is respectfully submitted.

HORATIO PRATT,
EBEN WILLIAMS,
JACOB SHEPARD,
JOSEPH CARPENTER, } Committee.
PLOUGHING.

The Committee on PLOUGHING have attended to the service assigned them, and re-

leave to report that they have awarded the following premiums :

Leprillette Sweet, Attleboro', 1 yoke oxen,	\$7 00
Jacob Dean, Mansfield,	6 00
Schuyler Shepard, do.	5 00
Samuel A. Dean, Taunton,	4 00
Zeph. Dean, do.	3 00
Luther L. Short, do, yoke steers and horse,	5 00

The Committee recommend that the sum of \$2 be awarded to Samuel A. Dean, and the same sum to Jesse R. Carpenter, in addition to the regular premiums.

The Committee also award a premium of \$3 to Daniel Briggs, Jr, Norton, for best plough.

Second do. Jacob Dean, Mansfield, \$2
Per order of the Committee,

C. LEONARD.

MIDDLESEX AGRICULTURAL SOCIETY.

THE CASTOR OIL BEAN.

Mr Wright's Letter to the Committee on Agricultural Experiments.

Concord, Oct. 5, 1831.

GENTLEMEN—As you are assembled to take into consideration the agricultural concerns of the County, permit me to give you an account of an experiment which I have tried, and which has been crowned with complete success. I have for several years past been in the practice of appropriating, annually, a small piece of ground for the culture of the *Palma Christi*, or Castor Oil Bean, and I find that the crop produced is about half as many bushels as would be raised of Indian Corn, upon the same land, and under similar cultivation.

The Oil here presented has all the sweetness of fresh butter, and without any bad taste or smell; but as it has just come from the press, it has not had time to clarify itself, and assume that whiteness peculiar to imported, or the Southern Castor Oil.

I consider it the duty of those who possess any information that will advance the interests of the Agriculturists or Manufacturers of the County, to lay it before the Society, that it may be made beneficial to all; this has induced me to present this sample for your inspection. It was manufactured by Mr BENJAMIN DEAPER, of Buxboro', who had erected a press for that purpose. The kernels pressed cold yield two gallons of Oil to the bushel.

I do not think, however, that during the continuance of the present low prices of the Southern Oil, that the cultivation of the Castor Oil Bean is of any very great agricultural importance, only, as it has a tendency to develop the slumbering resources of this section of the Country. Yours respectfully,

ANTHONY WRIGHT.

Certificate from Dr Josiah Bartlett.

CONCORD, OCT. 4, 1831.—This may certify that the subscriber has, within the last two years, made frequent use of the Oil raised and manufactured by Capt. A. WRIGHT, and has invariably found it to possess all the qualities of the best imported Castor Oil.

J. BARTLETT.

Large Apple.—The Lincoln Intelligencer, a Maine paper, states in substance that an apple, called the Jackson apple was raised by an old friend of the General, at Bowman's Point, Hallowell, which weighs one pound and girls 13 inches. The Editor of the Maine Inquirer, published at Bath, states that he has seen an apple, raised in the garden of Col. Thomas D. Robinson of that town, which girls 15 inches, and weighs 22 ounces; and that he could show a bushel of apples, raised in the same garden, the smallest of which would be larger than the apple first mentioned.

From London's Magazine of Natural History.

THE ROT IN SHEEP.

Most of your readers are aware that by the frequent and repeated moistening of land the grass grows in abundance, much more quickly, and has a more luxuriant appearance, particularly when the weather is close and warm. It is this quickness of its growth which I think is the great cause of the mischief. When grown slowly, time is allowed for that bitter principle to be more fully elaborated, on which depends the good quality of our grasses, which is the case in a moderately dry season, and when also the disease does not make its appearance. But when, contrary to this, the grass grows too quickly to allow that change taking place, and it does not contain that bitterness, but has a more delicate appearance, or what is termed squashy, the sheep become diseased from the loss of that usual stimulus to the bowels, the bitter principle of well grown grass. In consequence of this they become torpid, the food not well digested, the secretion of bile sluggish; and here is the foundation of that mass of disease in the liver. How for this opinion may be correct I leave to the judgment of others; but should it prove so, the remedy will be simple when taken in the first place, i.e. before the matter is formed in the liver. I presume that for the want of that stimulus to the bowels the liver does not perform its functions, and becomes overloaded with bile, part of which is again circulated with the blood; but in time, from its stagnation it becomes putrid, and matter is formed upon the liver, in small tubercles, which bursting into each other become abscesses, in which are found the hydatids or flukes. By what means they get there is at present a matter of conjecture. It is certain they are animal-like, as they have been seen to move several hours after their removal from the sheep. It may be asked by some, How are we to know the rot in its first stage? The weather, the situation of his land, together with his own judgment as to the probability of the flock becoming diseased are the shepherd's best guides. The sheep, themselves, in an early stage of the disease will appear stolid, and their eyes dim, with a tinge of yellow; i.e. having a jaundiced appearance. In this state, I should give a few doses of mild mercurials, saline aperients, and then a mild bitter infusion, such as infusion of chamomile or of gentian, two or three times a day.

To obtain the Skeletons of Small Fishes.—My method is this:—I suspend the fish by threads attached to the head and tail, in a horizontal position, in a jar of water such as is found in ponds where tadpoles abound; and change it often, till the tadpoles have finished their work; which, if two or three tadpoles are allowed to work on a fish of a small size, they will complete in twenty four hours. I always select the smallest sort of tadpoles, as they insinuate themselves between the smallest bones, without destroying their articulation. (T. Bluett, in *Philosophical Magazine*, vol. vii. p. 151.)

The Fact of the Flight of Earwigs I had long known, on the credit of others, but not at all from inspection, till May 12, 1831. Between 5 and 6 P. M. the atmosphere was warm and most exciting, when, in an area between two ranges of hot-bed frames, I saw numerous specimens of *Forficula minor*, all in highest ecstasies, and traversing the

ground in all directions. I thought I also saw some flying, and alighting round about. Hereupon I caused one on the ground to mount my hand, and elevating it to the level of my eye, saw it fly off; thus also did a second, a third, and a fourth. Each, before taking flight, aided or effected the expansion of its snow-white membranous wings with the forceps in its tail, which it turned over its back, and used with admirable adroitness. They flew ably, and in curves of short diameters. This instance is very similar to the one related in Kirby and Spence's *Introduction to Entomology*, vol. iv. p. 514.—John Denson. *Bayswater*, July 12, 1831.

Mount Auburn, in the vicinity of Boston has been consecrated as a place of sepulture for the city dead. It is spoken of as a place of unrivalled rural beauty. Boston has set a laudable example to the cities and crowded villages of our country. To retain their dead within their walls is to board up contagion and death for their inhabitants—it is to drown the solemnity of death in scenes of active life and the solemn stillness of the grave in the tumult of business.—N. Y. paper.

OPENING OF THE OHIO CANAL.

It will be seen by the following extracts that great rejoicings took place at Columbus, Ohio, on the arrival of the first boats, through the canal at that place.

From the Columbus (Ohio) Monitor.

New era to the Scioto Valley.—Canal navigation is now opening from the lake to this place, and to Circleville, 26 miles further south. The pleasure boat Gov. Brown, of Circleville, made her first trip from Circleville to this place on Thursday last; being the first canal boat that ever entered the waters of the Scioto. She was well filled with gentlemen and ladies. Her arrival was cheered by the discharge of cannon, ringing the state house bell, music, huzzas, waving of handkerchiefs, and exhibitions of joy of the citizens of this town.

More welcome arrivals.—On Monday three canal boats arrived at this town, viz: the Cincinnati, Red Rover and Lady Jane, from Cleveland. These were the first boats that had passed the Licking Summit. The first fruits of navigable commerce with the lakes, and the state of New York to the town of Columbus, was welcomed by the firing of a sixpounder, the ringing of the state house bell, a procession of citizens, and an address from a committee, and a collation, partaken in common by the boat's company and citizens. The scene was intensely gratifying to the man of business, and admirers of internal improvement; and it is hardly less animating to the youth, and very many of the adults in this place, who had never seen any water craft superior to an Orleans flat. The sight of these boats was marvellous to some slow calculating pioneers of these 'western wilds,' who never believed that in their day, a canal boat would reach Columbus, from the lake. The first boat was adapted to heighten the marvel. It was the Cincinnati, which had been built at the city of New York, and actually floated on the 'briny waves' in that harbor; had passed up the majestic Hudson; the great western canal; the boisterous lake Erie, and plied the Erie and Ohio canal, a distance of about 240 miles. Six years ago, on the 4th of July last, this gigantic canal was commenced. It is now finished 40 miles farther south, and it is expected next year to mingle its waters with the Ohio.

From the Columbus (Ohio) Sentinel of Sept. 27.

Reception of the first Boats.—On Monday last, the three boats; Cincinnati, Red Rover, and Lady Jane, were welcomed to our wharves by a great concourse of citizens, under the discharge of artillery, and amidst the joyous greetings of the multitude assembled.

On the Thursday previous, also, the pleasure boat (but partially finished) Governor Brown, from Circleville, made her first entry into the waters of Scioto, at this place. This was the first in the train, but the third above named, together with the Victory, the Chillicothe, the North America, the Circleville, and the George Barker, were from Cleveland and other points on the main canal, and the first that ever passed the Licking Summit.

The reception of these several boats, with their music playing and their flags flying, was peculiarly gratifying. The occasion was duly honored by the citizens of this town, and the proceedings were culled by the presence of hundreds of spectators, who were attracted to the scene by the ringing of the bell, and by the sound of the cannon upon the bank of the River. The committee of arrangements met the first boat at the wharf, where an address was made on behalf of the town by Col. Wm. Doherty, and appropriate salutes were fired from the bank and returned from the boat.

The man of enterprise, the merchant, the farmer, the mechanic, and indeed, every class and condition of society, must feel the importance of opening canal navigation to this town. It may well be considered our entrance upon that prosperity which is to mark our future growth, and which will give an impetus to the future wealth and commerce to this portion of Ohio. Several of the boats, we understand, were built in New York, and after floating up Lake Erie, have come among us as it were from another hemisphere, extending their proffered reward to many years of toil, and holding before us the reflected image of that energy which planned and matured this noble work. And a scene so animating, we may well turn back to the patrons of the project, and offer our gratitude to those whose zeal and industry, and untiring perseverance, have accomplished what a few years ago were locked in the mazes of mystery and doubt. The canal commissioners have each an honorable share in the recollections of a grateful public on this occasion, but for the success of the work to this town, and on that portion of the canal in which Columbus is more immediately interested, we are indebted to the energy and exertions of Alfred Kelly, acting canal commissioner, whose presence animated the scene described, and who, we could perceive, participated largely in the gratifying spectacle he had contributed to produce.

The Scioto Gazette, speaking of the Ohio canal, in which in a few days there will be a continuous navigation of two hundred and fifty miles, from Lake Erie to Chillicothe, says that, in anticipation of that event, many merchants have already purchased their supplies of fall and winter goods at New York, and have contracted to have them delivered at that point. The entire cost of freight commission and insurance (with the exception of the risk on the lake) will only amount to \$1.27 the hundred pounds. Before this communication was opened, the foreign commodities disposed of in that market were brought by the way of Pittsburgh and the Ohio, and the average cost of their transportation was about \$4.75 per hundred.—Thus there is a saving of nearly three dollars per hundred of all the foreign merchandise offered there for sale, which if estimated at five hundred thousand pounds' weight, not to speak of salt, coal and various other domestic articles. There is also a gain of fourteen or fifteen days in time, which is often as valuable to the merchant as money itself.

That section of country, it is added, is essentially agricultural, and will be, if not already so, the greatest exporting district west of the Alleghany mountains. It must, for years to come, purchase its supply of clothing, many of its other necessities, and its luxuries, with its agricultural productions, to send which to market by any other conveyance than by water, (or one equivalent in cheapness,) would consume almost their entire value, in the cost of transportation. How important this communication! it is truly said, by which this produce may be carried to market, unburdened by a tax conveyance which would amount in fact to a prohibition.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, NOV. 9, 1831.

FARMER'S WORK FOR NOVEMBER.

Fall Ploughing.—It is commonly advisable for cultivators to plough most, if not all their land in autumn, which they propose to till the next season. The advantages of fall ploughing are, 1st. It saves time and labor in the following spring, when farmers are generally pressed by their avocations, and their cattle are comparatively faint and weak. 2. Land which is ploughed in autumn will be more exposed to the action of frost than that which is suffered to remain, and frost will pulverize the soil more effectually than can be done by artificial methods. 3. Ploughing lands late in the fall is of service by exposing insects, and their eggs and larva to be destroyed by frost. If however, the land is very light and sandy it may be as well not to plough it till spring, as it will be more solid and tenacious if permitted to remain without being stirred previous to the setting in of winter.

Much has been said on the depth of ploughing; but we believe that no general rules, not liable to many exceptions, can be given on this subject. The depth should be governed in some measure by the staple of the soil. Where the soil is deep, we should prefer deep ploughing. But where the soil is very thin it may be necessary to commence the cultivation with shallow ploughing. If the plough turns up too much at a time of the barren soil immediately beneath the upper stratum, the succeeding crop will be of little value. The owner of such soil should endeavor to render it deeper by degrees, according to the manure he may be able to bestow on it. A shallow soil is not only deficient by its furnishing but little pasture for the roots of plants, but it is liable to be so much scorched by drought as to be incapable of producing any profitable vegetation. If, then, your soil is thin, plough it with a shallow furrow, and sow it with rye. The next season plough a little deeper, add manure, &c.

Land should generally be broken up from the sward with a deeper furrow than may be required in subsequent culture. Harrowing and shallow ploughing will then answer through a course of crops. If the soil is light and porous the furrow slice should be turned over as flat as possible. If it be a stiff loam or mixed with clay it may be well to lap the furrow slices a little one upon the other, so as to permit the air and frost to pervade the hollows or interstices between and under the furrow slices.

☐ The following able and satisfactory article will supply, we believe, all the information necessary to enable every Farmer, not only to construct an Ice House, on the best principles, but to apply it to the best purposes. We should be highly gratified, and the public greatly benefited by further communications from the respected Author.

MR FESSENDEN.—In answer to your request for practical information on the subject of Ice Houses, I take the liberty of giving you a description of one, which I constructed several years since, at a moderate expense, and in which I have been perfectly successful in preserving ice through the summer and autumn.

A pit about 13 feet long and 9 feet wide was dug in level ground to the depth of 10 feet. The four walls or sides of the Ice House consist entirely of *cedar*. Each wall is rendered double by nailing the boards horizontally to two opposite sides of joists, 4

inches square, placed perpendicularly at the distance of a few feet from each other. The interval between the boards is filled with tan, and a space of about 4 inches in width entirely around the building, on the outside, is also occupied by tan; so that the earth or soil nowhere touches the boards. Upon these walls, which are 11 feet in height, and of course project one foot above the surface of the ground, is placed a very sharp roof. This roof is also double, and the interval between the boards is filled with charcoal powder. It is painted white on the outside.

The aforementioned pit is divided by a double partition, filled with tan, into two apartments. In one of them, which is about 8 feet square, the ice is deposited. The other apartment is employed as an Entry, at the bottom of which is a door, made double as aforementioned, for the purpose of taking out the ice from day to day. This entry, whose temperature in the lower part, is very uniformly that of cool weather in the autumn, is furnished with shelves for the reception of butter, meat, milk, &c, during the heat of summer, and is found to be extremely useful.

The ice is cut in blocks of regular form, and very closely packed, the interstices being filled with pulverized ice. All the space which remains above the ice, is filled with dry straw. A few cedar slabs form the floor on which the ice rests. There are several reasons for preferring *cedar* to other kinds of wood; and I did not find its expense to exceed that of inimitable pine boards. It would be convenient to have the entry a little larger than the one just described.

Yours respectfully,

P. CLEVELAND.

Brunswick, Me. Nov. 3, 1831.

HAMPSHIRE COUNTY CATTLE SHOW.

The Northampton Courier gives an account of the Show which took place on Wednesday and Thursday, 25th and 27th. Of Stock there were present 13 bulls, 29 cows and heifers, 31 pair of working cattle, 11 pair for the stall, 27 pair of steers, 12 steer and heifer calves, 14 swine, 8 sheep and 38 horses and mares, greater in number, and much superior in quality to former years. The exhibition of Manufactures, owing to the storm, was inferior to former years. On Thursday there was an exhibition of horses. At 11 o'clock an Address was delivered by Hon. S. F. Dickinson of Amherst, possessing high practical merit and instructive and gratifying to the audience.

Further particulars hereafter.

Seed Corn.—A farmer on the east side of the river, informs us that, having often read accounts of the crop of corn being increased by selecting seed from stalks having two or more ears, he was induced to try the experiment. He has selected his seed corn in this way for three years past, and the result has exceeded his expectation. He states that it is not uncommon to find in his cornfield this season, 'stalks with three, four, five, and sometimes six ears, and three of them fair, full-grown, and fit for seed, and that too in hills containing four or five stalks.' He says, 'I think my crop has been increased several bushels this year by the experiment. I would suggest a mode of selecting seed to those who do not cut up the corn at the roots. When they are picking corn, and find a stalk with two or more ears, let them tie the husks together, and the ears will be easily known at husking.'—*Hamp. Gazette.*

In the course of debate, in the New York Convention, Mr McCulloch, of Baltimore, stated that the value of Leather annually produced in the single State of Maryland, was \$1,300,000.

Horwinstall Hall,
Saturday, November 5.

FRUITS EXHIBED.

Pears.—From Dr Fiske, of Worcester, Seedlings, and of a good sweet flavor, worth cultivating. A few scions would be very acceptable. The letter accompanies this. [Published below.] A Pear from Mr Ebenezer Wright, of Boston, raised in Dedham, weighing 24 ounces.

Seedling Apples, by Benjamin Guild, Esq.; sweet Pears, from James Wadsworth, Esq., Genesee, N. Y.; these were very fine—good table fruit. A large white sweet Russett, and a red apple, very juicy and sweet, raised by J. Pinneo, Hanover, N. H.

In behalf of the Committee on Fruits.

S. A. SHURTLEFF.

Worcester, Dec. 24, 1832.

MY DEAR SIR—I am happy in having found another occasion for addressing you on the subject of native fruit. My communications would be more appropriate to the Committee on Fruit, for whom they are ultimately intended; and my apology for this *transit* is, that they, and we all know that you, sir, are never more happy than when aiding their labors in common with the general interests of the society. Another inducement is, sir, that your office affords a more convenient medium than the *Post Office*. I herewith send a specimen of a native Pear gathered the 29th ult., from a tree reared by my brother in Claremont, N. H., from a seed from his native town of Brookfield, in this country, which he planted thirty-two years ago. The common weight of the pear is from 8 to 10 ounces. I saw one gathered from the tree which weighed 11 ounces. They are not in perfection until about this time in October; and are best when recently gathered. The tree in its prominent appearance so closely resembles the *St Germain*, that I should have mistaken it for one of this kind had I not seen the fruit.

The Committee in estimating the value of this variety will bear in mind that it was gathered prematurely, and that it does not now possess the richness and flavor which it would have acquired, and which other celebrated kinds attain in the last period of connexion with the parent stock. They will judge how far it is worthy of propagation. I considered it so great an acquisition to our native stock as to have made arrangements with my brother for a supply of scions—a part of which I will send to the society for distribution, should it deem it an object to obtain them.

Respectfully, your friend and servant,

Z. Cook, Jr. Esq.

O. FISKE.

Good Yield.—Capt. J. E. Treadwell of Kennebunk gathered from one hill containing six stalks, sixteen good sized, and perfectly sound ears of corn. Two of the stalks had four ears each and four two ears each. There are but little short of five thousand kernels on the sixteen ears.

Great Yield.—Eight hundred and ten beans were produced from a single seed, planted and raised by Mr John Pinks, of this village, the past season. They are of the black kind.—The beans and stalk on which they grew, may be seen at this office.—*Greenfield Gazette.*

A correspondent of the New York Advocate states.—In a town containing about 1400 inhabitants, in a sterile part of New Hampshire, about 50 miles northwest of Boston, there was manufactured into starch, for the use of manufacturers 15,000 bushels of Potatoes, at 20 cents per bushel, amounting to 9000 dollars.

TO CORRESPONDENTS.—We regret our inability this week to insert several communications, among which is a valuable one from Salem, on Live Fences.

Further Reports of Worcester Cattle Show, also of Northampton Cattle Show, are unavoidably omitted this week.

NOTICE.

Members of the Massachusetts Horticultural Society who intend offering Chinese Chrysanthemums for premium, are requested by the Committee on Flowers, &c, to have them at the Hall of the Society on Saturday next, by 11 o'clock.

Per order, R. L. EMMONS, Chairman.

ONIONS WANTED.

A fair price will be paid for 200 bushels of Onions, viz. 100 bushels Yellow, 50 do. White Portugal, 50 do. Large Deep Red.—It to be large selected roots, the quality pure, and to be delivered immediately. Apply to J. B. RUSSELL, Agricultural Warehouse, Boston.

White Raspberry Plants, &c.

For sale by J. B. Russell, No. 52 North Market Street, Boston.

A few dozen genuine White Antwerp Raspberry Bushes, packed in moss, price \$1.50 per dozen. Also a few Double Flowering Almonds, Strawberries, Rose Bishes, Syringas, Grape Vines, &c, &c. Nov. 9.

Fruit Trees.

Peach—Pear—Apple and Cherry Trees, very thrifty, and in fine order for setting, for sale at Wm. Buckminster's Nursery, in Framingham. Nov. 9.

Flooring Boards, &c.

Of hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any reputed dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr., 65, Broad street. Nov. 9.

Plants for Sale.

For sale at the office of the New England Farmer, one Imperial Smith Press, and one Royal Washington Press, both in complete order.

Also,—two of Fairbank's New York Iron Inking Machines. They have been in use but six weeks, and are as good as new ones. They will be sold for considerable less than cost, as the present proprietor has no further use for them. I. R. BUTTS.

Grape Vine Plants.

For sale at the garden of S. G. Perkins, in Brookline, on the most favorable terms. The plants may be seen and purchased at the Garden at any time, or orders may be left with Mr. Perkins at his office, corner of State and Congress streets.

The vines are from one to four years old, in fine order, with wood enough of this year's growth attached to most of the plants to make a dozen or more vines. Chasselas, common white, or *Thomery*. Chasselas de Fontainebleau, or *Thomery*. Chasselas d'Ore, Bar Sur Aubé.

Chasselas, red. Chasselas, Muscat. Black Hamburg. Black Cape. Espérance, black. Frankendall, do. St Peter's, do. Zinfandel, by some called the Black Prince; the bunches produced on this vine are very large. Isabella. Muscat of Alexandria. Muscat, red. Muscat, Güzley. Muscat, white frontenac. Muscat, purple.

Constantia—the sweetest of all Grapes, and a great bearer; the berries contain but one seed generally, and sometimes none at all. SAMUEL G. PERKINS.

Fruit Trees, &c.

As the season for transplanting Trees is approaching, the subscriber offers at his Nursery, near the Court House in Worcester, the most approved variety of Apple, Pear, Cherry, Peach, Apricot, and Plum Trees, of good size and vigorous growth. Also, Horse Chestnut, and Catalpa Trees, for ornament and shade; Isabella and other Grape Vines; Honeysuckle, Strawberry Vines, &c.

Also, Mulberry Trees of good size, for transplanting, which may be had after a few days' notice, from another Nursery. O. FISKE. Worcester, Oct. 19. N. Y. 2.

Splendid Bulbous Roots.

Just received at the Agricultural Warehouse and Seed Store, No. 59 1/2 North Market Street, direct from Van Eeden & Co. Harlem, Holland, a large assortment of Bulbous Flower Roots, comprising the finest varieties of HYACINTH—(double and single) dark blue, porcelain blue, red, rose colored, pure white with yellow eye, white with rose eye, and yellow with various eyes; from 12 1/2 cts. to \$100 each.

11 LILIES—(double) variegated, red, yellow and mixed, 12 1/2 cts. each. \$1 per dozen, (and importation of fine tulips is very large, and we are enabled to put some sort as low as \$6 per 100—an object to those who wish to form a superb tulip bed.)

CROWN IMPERIALS—assorted, of the most splendid colors, and showy flowers, large roots, 25 to 35 cts. each, (extra fine roots)

JONQUILLES—sweet scented, finest roots 12 1/2 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with citron cups, extra sized roots, 25 cts. each.

DOUBLE NARCISSUS—fragrant, of all colors, 12 1/2 cts. each—per dozen, \$1.

SPRING CROCUS—of all colors, 6 1/2 cts. each, 50 cts. dozen.

PODOPHYLLUM PELTATUM—(a most singular production, fruit bearing and medicinal) 12 1/2 cts. each. The above roots are from the same house from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bells 1 inch and 8-10ths in diameter.

Purchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers.

Also, a further supply of Bulbous Roots, comprising Large White fragrant Lilies, 12 1/2 cts. each, 1 dollar per dozen, Tiger (spotted) Lilies, same price, Marigold or Turk's Caps Lilies, same price.

Grape Vines.

For sale by the Subscriber, at his Garden in Dorchester, several varieties of Grape Vines, Scotch Gooseberries, Altheas, and Forest Trees. Among the former are Black Hamburg, Oval Purple, Round Black, 2 to 4 years old—have borne fruit the present year. White Muscadel, Constantia.

Black and white Moscatel—one year old. The parent vines are represented to have borne clusters weighing 26 lbs.

Barcelona, a beautiful fruit, one year old. Polonois. Mantau Castal—Procured for me by the Consul at Cadiz, and said to be the most valuable Grapes produced in Spain.

Clarence, or No. 13, a valuable variety, and great bearer. Isabella, Catawba, } Native. Flad. } With many other sorts.

Orders for any quantity of the above will be promptly executed, on application by mail, or otherwise, at the Garden, or at 7 1/2 Congress street.

Oct. 5. 5t ZEBEDEE COOK, Jr.

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery. Trays of all kinds, Fancy Goods, &c, &c, which he will dispose of at as low a rate as can be purchased in the city. [Watches repaired and warranted.]

BRIGHTON MARKET.—Monday, Nov. 7.

[Reported for the Chronicle and Patriot.] At Market this day 2022 Beef Cattle, 721 Steaks, 3067 Sheep, and 2712 Swine.—About 500 Sheep and 600 Swine have been before reported.

12 or 1300 of the above number of Beef Cattle were taken by the barrellers before they arrived at Brighton. It is our usual practice to include such in the number reported.

Prices.—Beef Cattle.—The market was quite brisk, and prices were rather uneven, but on the whole better—we shall quote a little higher, extra \$5 25, prime \$5, good 4 50, thin 3 a 25.

Barrelling Cattle.—Mess \$3 84 a 4, No. 1, 3 33 a 3 50; No. 2, 3 a 3 25.

Working Oxen.—We noticed sales at \$50, 60, 62, 67, 78 and \$92.

Cows and Calves.—No sales noticed.

Sheep.—We noticed sales at 1 88, 2, 2 17, 2 25, and \$2 50. A few prime Sheep and a few Wethers were sold, price not known.

Swine.—No particular variation from last week—we noticed a lot of 20 barrows, selected, at 5c; a lot of 100 half barrows, selected, at 4 1/2; a lot of 50, two thirds barrows, selected, at 4 1/2, and a lot of 50 at 4 1/2; a lot of 100, to close, at 4 1/2. At retail, 4 1/2 for sows, and 5 1/2 for barrows.

New York Cattle Market, Nov. 4.—At Market this week, 100 head Beef Cattle, 6000 Sheep and Lambs. Beef Cattle all sold at full as good prices as last week, at \$4 to 6 75. Good Cattle very scarce and some sales at 75. Sheep and Lambs—remarkably dull sales, and numbers driven back; Sheep \$2 a 5, Lambs 1 50 a 3. A few sales made at the last prices. Dressed Pork 5 1/2 to 6.—Live Fat Hogs, 3 a 4.—N. Y. D. Ad.

MISCELLANY.

RAIN WATER DOCTOR.

Some twenty years ago, there sprang up, in the State of Connecticut, a noted quack, commonly known by the name of 'Dr Rain-water.'

Austere and lonely, cruel to himself,
Did they report him. 'Water he drink,
His food stale bread and pottage.'

In enunning quacks, who shroud their arts in a veil of mystery, the vulgar always repose a superstitious confidence which give the practitioners complete control over them. Dr Rain-water used his power to noble purpose. Believing that most diseases sprang from dram-drinking, he gave his patients some inert nostrum, and solemnly charged them to touch no drink but rain water, declaring that should they use any other, the medicine would operate as a poison. All their food, too, was prepared in rain water. Of course his patients complied, and the success of his practice was astonishing. His fame spread far and wide. The sick were brought to him in such numbers as literally to crowd his door and surround his house. Lingering affections, on which the whole materia-medica had been poured in vain, vanished before Rain-water, as if by a spell. The physicians were astounded, and students in medicine trembled at the anticipated ruin of their destined vocation.

But poor Rain-water at length fell, like his own element from a bursting cloud; but never, like that, to rise again. His secret came out, and he was instantly deserted.

L'Envoiy.—Dr Cold-water, who now offers his gratuitous services to the public, is undoubtedly quite as skillful as Dr Rain-water: but fortunately or unfortunately, has nothing to recommend him but honesty, philanthropy, truth and wisdom, which, however, it is hoped, will one day accomplish as much as a quack's label.—*Salem Gaz.*

Rules to be observed in speaking of others.—The following rules of Dr Cotton Mather, on the subject of slander, are recommended to the consideration of the lovers of peace.

'He resolved he never would speak evil falsely of any man; and if ever he spoke against any, it should be under the following restrictions and limitations which he conscientiously observed:—

'He would consider whether it would not be proper to speak to the person himself, concerning the evil before he spoke of it to any one else.

'He would ordinarily say nothing reflecting on any man, behind his back, which he would not readily say to his face.

'He would aggravate no evil of another, which he had occasion to speak of, nor make it worse than it was.

'When he was properly called to speak against any man, if he knew any good of him, he would speak of that too.

'He would be sure to maintain charity towards the persons of all that he had occasion to speak against, and would heartily wish them all good.'

A Polish proverb says—'You may strip a Pole to his shirt—but if you attempt to take his shirt, he will regain it.'

A person inquiring what became of such-a-one: Oh, dear, says one of the company, poor fellow he died insolvent, and was buried by the parish. Died In-solvent, cries another, that is a mistake, for he died in England, I am, sure, I was at his burying.

No Croaking.—If a man be gloomy, let him keep to himself. No one has a right to go croaking about society or what is worse, looking as if he stifled grief. These fellows should be put in the pound. I like a good broken heart or so, now and then; put then we should retire to the Sierra Morena mountains, and live upon locusts and wild honey.'

The most agreeable of all companions is a simple frank man, without any high pretension to an oppressive greatness, one who loves life, and understands the use of it; obliging alike at all hours; above all, of a golden temper, and steadfast as an anchor. For such an one, we would gladly exchange the greatest genius, the most brilliant wit, the profoundest thinker.

Value of a Nail.—We have been told that the first nail ever seen in Madagascar was taken from a boat at Riotea. It was a spike nail, and brought hither by its fortunate possessor as something of rare value. And so it proved, for he made no small gain by lending it out for hire to canoe builders to bore holes in the sides of their planks. Afterwards another lucky fellow got hold of a nail, and not knowing how such a thing came into existence, he shrewdly conjectured that it must have been formed by a process of vegetation. Wherefore, to propagate so valuable an exotic, he planted his nail in the ground, but waited in vain for the blade, the bud, the blossom, and the fruit. This man is still living, and has not heard the last of his speculation, being often reminded, to his no small chagrin, of the folly by which he acquired at least one piece of knowledge.—*Tyerman and Bennett's Voyages.*

When Mr John Kemble played Hamlet in the country, the gentleman who acted Guildenstern was or imagined himself to be, a capital musician. Hamlet asks him, 'Will you play upon this pipe?'—'My Lord I cannot.'—'I pray you.'—'Believe me I cannot.'—'I do beseech you.'—'Well, if your lordship insists on it, I shall do as well as I can,' and to the confusion of Hamlet, and the great amusement of the audience, he played God save the King.

The Tartars have a singular manner of drawing water from a great depth. A long rope, with a large leather bag (kept open at the mouth by a hump), is let down into the well; the end is fastened to the saddle of a mounted Tartar, who rides off, and by this means draws the water from the well; a person in attendance empties the bag while the horseman returns, and repeats the process as often as may be required.

When the Hon. F. N. was governor of Ceylon, he was addressing a native prince through the medium of an interpreter, in a high strain of courtly adulation, to each sentence of which the prince answered, 'Cadab.' This was repeated so frequently as to induce the governor to inquire into its meaning. 'He means to say,' answered the interpreter, 'that your excellency hes.'

The Board of Health.—A countryman walking along the streets of New York, found his progress stopped by a close barricade of w. od.—'What is this?' said he to a person in the street. 'Oh, that's to stop the yellow fever.'—'Aye, I have often heard of the board of health, but I never saw it before.'

A joke which has run through the press about Signor Paganini and pretty Miss Waters, arose in the following manner:—At a dinner at De Bagni's, whose pupil the young lady is, Paganini was handing her from one room to another, and she, lost in admiration of him, exclaimed, 'I wish I was your fiddle;' to which the Signor instantly replied, 'And I wish I was your beau.'

FRUIT TREES.

For sale at the KENRICK NURSERIES, in NEWTON, near Boston, a most extensive assortment of Apples, Pears, Peaches, Plums, Cherries, Apricots, Nectarines, Almonds, Molberries, Quinces, Raspberries, Gooseberries and Currant bushes, Grape Vines of the best foreign sorts, and 25 finest varieties of Strawberries, including the most rare, productive and esteemed.

Also about 40 varieties of the most hardy ornamental trees and shrubs, and superb hardy roses, including Silver Firs, varieties of Spruce, Flowering Horse Chestnuts, Flowering Catalpas, Mountain Ash with beautiful clusters of red berries in autumn and winter, Purple Acacia, Three Thorned and Thornless Acacia, Butternuts, Ailanthus or tree of Heaven, Elms, American and Scotch, Sugar Maples, Weeping Willows, &c. &c. Napoleon from St Helena tree, Honey-suckles. Many of the above sorts of trees of extra sizes, for ornamenting highways and commons.

WHITE MULBERRIES, genuine sort for silk worms, by the 100 or 1000 for Pl. nations.

ISABELLA and CATAPAW Grape Vines, either singly or at reduced prices by the 100 or 1000

CHINA ROSES, CHINESE CHRYSANTHEMUMS, GERANEUMS, &c. &c.

Written orders addressed either to JOHN or WILLIAM KENRICK, NEWTON, are regularly received by the daily mail, and will be promptly attended to, or they may if more convenient be left with J. B. Russell, at the New England Farmer office, where also, catalogues may be obtained gratis on application. But purchasers are invited when convenient to call and examine the trees, &c. for themselves, and make their own selections; but when this is not convenient, then let them forward their orders, relying that the very best possible selection will be made for them. Trees when destined for a distant place, are carefully packed either in clay or moss, and mats, and delivered whenever ordered in Boston free of any charge for transportation. ep1D1 Oct. 19.

Ammunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded Jan.

Pear Seedlings.

For sale at the Agricultural Warehouse, No. 52 North Market Street—

PEAR SEEDLINGS, of vigorous growth, and promising appearance, raised within six miles of Boston, in fine order for nurseries—the largest size are from 18 to 24 inches in length, the whole plant; price \$10 per thousand; the second size from 12 to 18 inches in length price \$5 per cent. They will be suitably packed as wanted, for transportation to any distance. Oct. 19.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

Printed for J. B. RUSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for printing received by J. B. RUSSELL, at the Agricultural Warehouse, No. 52 North Market Street.

COMMUNICATIONS.

ON LIVE FENCES.

MR FESSENDEN—In your paper of the 21 November I noticed a communication from Judge Buel of Albany nursery upon live fences. It always gives me much pleasure to obtain any information from one who so well unites the theory of horticulture with the practical results of his own experience. In many of his statements I fully agree with him. From long experience I am convinced of the superiority of live fences, both as regards efficacy and economy. I also highly approve the manner of setting out the young quicks, which he describes. I differ from him only as to the material or plant of which the hedge is made, and as to the advantage of splashing or as the English call it plashing.

For the last twenty years I have paid great attention to this subject and will give you the result of my experience. The first hedge I set out (about 500 feet in length) was of the English Hawthorn or Quicks. The result was decidedly unfavorable. The plant is not adapted to this climate—it appears better suited to the moist atmosphere of England; our long summer drought, injures it, it is peculiarly subject to the attacks of the borer, a species of mildew or blight almost invariably assails it early in August, by which it loses its leaves and by the middle of August or first of September assumes a wintry appearance.

My next experiment was with the three thorned scacia recommended by Judge Buel. The hedge was not more than fifty feet in length, but was placed in excellent soil and carefully attended. I had supposed that the long thorns with which the plant is armed would have made it peculiarly efficacious as a fence. The result was even more unfortunate than before. Prune and clip it as I would, I could never make it grow thick; it appears to have a decided tendency to shoot upwards rather than to spread; the thorns grow only upon or near the upper branches, and below there was nothing but the bare stems to serve as a fence. It would often too, lose as much during a hard winter, as it had grown during the whole summer. After a fair trial of near ten years I dug up the whole and replaced it with the American Buck-thorn (*Rhamnus cathartica*); with this I have been completely successful. It has it is true but few thorns, but it grows naturally so thick as to be a complete protection to the land inclosed by it. It shoots early in the spring and holds its verdure till very late in the fall. If properly managed, it is so close below that a rabbit could scarcely work its way through, while above the strong branches are so wattled and interlaced, that a man could not scale it, nor a bull force his way through it.

I have now in different places at least half a mile of this hedge which I shall be very happy to show to any of your correspondents who may wish to see it.

The mode of cultivation is very simple—it is set out either in the fall or spring in the manner recommended by Judge Buel; if in the fall, it is clipped the next spring within about nine inches of the ground. Next spring it is clipped again at the

height of about two feet, the third spring at about three feet from the ground, with some side pruning. The next summer your hedge is complete and you may keep it at the height and thickness desired at the expense of a little pruning.

I have also tried plashing. In 1818 or 19 my gardener, who was an Englishman, highly recommended it and at last persuaded me to let him attempt it upon a young and thrifty hedge made of Crab apple. He did it as it appeared to me very skilfully, but it was a very long and tedious operation and the result was the hedge was ruined. His mode of operating (which is I believe the common one) was to suffer the main stem to remain upright, while all the side ones were partially cut and bent down nearly horizontally, and so confined either by interlacing or by staking them down; they did not thrive however—they perished by degrees and I was at last forced to prune away all the horizontal branches, and lost at least four years' growth.

With the Buck-thorn I have never found plashing to be in any degree necessary or useful. If managed in the way I have described, in three years the hedge will be complete, requiring afterwards very little care and nearly as thick, and quite as impervious below as above.

Very sincerely yours &c,

E. HERSY DERBY.

Salem, November 8, 1831.

USE OF EVERGREENS AS A PROTECTION AGAINST COLD.

MR FESSENDEN—In the proceedings of the Mass. Hort. Society of October 15, 1831, published in your paper of the 19th, same month, is a letter on the acclimating of the *Pinus pinea*; in which an old yankee notion is made to pass for new European discovery—the utility of evergreens as a protection against the effects of cold; and as I am stickler for yankee knowledge when it is equally as good as that which comes over the sea, I take the liberty to state a few facts.

In the early settlement of New England, hunting was a profitable employment; the hunters traversed the wilderness in the depth of winter, in search of game for the sake of the fur which nature had provided for the preservation and comfort of all the animals of a cold region; these hunters always protected themselves from the inclemency of the weather by temporary *bough houses*—evergreens of course. Although this may not be a historical fact, yet it is a well authenticated tradition. The white hunters no doubt borrowed the contrivance from the aborigines.

A venerable soldier of the revolution has informed me that he was with that part of the expedition against Quebec in 1775, which marched through Maine; during the march it is known that the army suffered greatly from the weather, from which many protected themselves during night by *evergreen* tents.

It is a well known fact in New Hampshire, that pine and hemlock boughs are a great protection against cold—farmers frequently cover their potatoes and other roots, with them during very severe cold, to keep them from freezing. In New Hampshire the boughs of the hemlock (*Abies can-*

adensis of Michaux) are considered much the best. There can be no difference between the boughs broken from the tree, and the boughs *growing*, because when broken off, evergreens preserve the vital principle during a considerable time.

Here are a few facts, to show that if Europeans have just discovered this property of evergreens, it was known and used a long time since in New England by civilized man. The writer of this, preserved several Orange plants during the last winter by covering them with hemlock boughs, and never once thought of his having made a discovery, because he has known this property of evergreens from his infancy.

With regard to the philosophy of their actions, as I am one of your plain *why and because* folks, I will try and give you the 'why and because' of this fact.

Some bodies are better conductors of heat than others, and those which conduct the best, are the worst preservers against cold. The leaves of evergreens in a green or living state have the property of being slow conductors of heat; therefore, they keep the heat in and cold out, or more properly they keep the heat *in only*. As soon as the leaves become dead and dry, they become conductors of heat; therefore, are not useful for the purposes under consideration. Green wood is a slow conductor of heat; when dried and baked it is a conductor; when reduced to charcoal it is a non-conductor—and when further reduced to ashes it again becomes a conductor.

Milford, Oct. 24, 1831. NEW HAMPSHIRE.

By the Editor.—The author of the article alluded to did not, we believe, mean to assert that there was any *novelty* in the principle, of protecting plants from cold by surrounding them by evergreens; but the application of that principle to protecting and acclimating plants, was for aught that appears an 'European discovery.'

SWEET POTATOES.

To the Editor of the New England Farmer.

In your paper No. 13, I have seen some inquiries respecting sweet potatoes. In Bucks County, some sixty years ago, I was well acquainted with raising Sweet Potatoes. They grow best in a light, sandy soil, and the general practice was to fill the hills, say four or five inches deep with manure from about the wood pile.

The only difficulty in raising them in great abundance was to preserve any seed from rotting in winter. The general practice was to buy their seed every year in Philadelphia at from four-pence to six-pence per lb. for very small roots or sprigs of roots.

A curious old farmer surmounted the difficulty of preserving seed, in the following simple manner.

He dug his seed before any frost, and dried them well in a warm dry room, then dug a hole under his kitchen hearth and packed them there in very dry sand; so particular was he to have this sand perfectly dry that he baked it on boards in his oven; then had a hearth stone neatly dressed to cover the hole; and preserved them perfectly sound until time to plant gardens.

The mystery is, that Sweet Potatoes, to pre-

vent their rotting in winter, must not only be kept from frost and wet, but also from cold and damp; and I have not the least doubt of their growing well in the New England States; but as I cannot obtain seed in this place I have not raised any.

Respectfully,
S. LESTER, Pa. Oct. 26, 1831.

ACORNS.

MR. RUSSELL—Here with send you, agreeably to your request, a quantity of acorns of the following species of oak for the London Horticultural Society, viz.

Those marked No. 1. The *Quercus alba* or White Oak, that species does not bear much this year, so I could obtain but a small quantity. This is well known to be the most useful timber tree in America.

No. 2. *Quercus montana*, or Mountain Oak, or Chesnut leaved oak, a noble timber tree next in rank for timber to the white oak. I could obtain but a very small quantity; the tree bore very little this season.

No. 3. The Gray Oak. I do not know the specific name. The best for fuel of any of the oaks, except the yellow oak.

No. 4. *Quercus castanea*, or Yellow Oak, very good for timber, and the best for fuel of any of the oaks; the bark is useful for dyeing; a large tree.

No. 5. *Quercus rubra*, or Red Oak, one of the largest of our timber trees, useful for staves, and the bark for tanning leather.

No. 6. *Quercus bicolor*, or false Red Oak, large tree.

No. 7. *Quercus coccinea* or Scarlet Oak, a large tree; this and No. 6 are called by farmers simply the Red Oak, but there is a distinction or difference in them which is known to botanists.

I expected to be able to obtain some of the acorns from the *Quercus victorica*, *Quercitrion* Oak, or Black Oak, also the *Quercus bicolor* or Swamp Oak, and the *Quercus ilicifolia* or Scrub Oak. The latter however is only a small bush, seldom grows higher than a man's head. The Black and Scarlet do not grow in this vicinity, but the Swamp White Oak does. I could not find one acorn of this year's growth.

I would suggest to you that if they are to be sent to Europe it would be well to put them in sand or earth, especially the White Oak and Chesnut leaved Oak, as they are beginning to sprout and if the sprout should wither may fail of growing; but perhaps you know how to manage them better than I can tell you.

Yours respectfully,
ELIHALET HUNT.
Chester, N. H. Nov. 31, 1831.

OAKS.

MR. RUSSELL—I send you a package of acorns, of each of the following varieties, for the London Horticultural Society.

No. 1.—(*Quercus coccinea*) Red Oak in New Hampshire, grows almost everywhere in New England, and reaches the height of 70 or 80 feet in favorable situations, and 8 or 9 feet in circumference.

Uses.—Wood used for dry timber, posts, rails and staves—bark used for tanning.

Soil.—Requires a deep rich loam; in thick forests its branches are not numerous, but in exposed situations it becomes very branching, and does not grow to so great a height.

No. 2.—(*Quercus montana* of Willdenow and Prince, *Monticola* of Michaux) Chesnut Oak, mountain oak in New Hampshire, grows in dry, deep and rich rocky soils, as large as the red oak in favorable situations.

Uses.—A most excellent fire wood, ship timber, dry timber and staves; bark used for tanning, but not considered good.

No. 3.—(*Quercus alba* of Wangenheim) White Oak in New Hampshire, grows to a large size in forests and sheltered situations.

Uses.—A most excellent timber for civil and naval building, staves for liquor casks, &c; bark inferior for tanning.

Soil.—Rather moist and rich loam.

No. 4.—(*Quercus castanea* of Willdenow and Prince, *castanea* of Michaux) Yellow Oak in New Hampshire, does not grow to so great a size as the three above.

Uses.—A most excellent fire wood; good timber for the saw, but does not split so well as those above—bark excellent for tanning and coloring yellow.

Soil.—A strong rocky loam—in sheltered situations it has but few branches.

The acorns from the above trees were gathered from young, thrifty trees, not more than 30 years old.

There are two other varieties of oak growing in this vicinity, what are locally called black oak and gray oak; the latter appears to be a cross of the red and yellow varieties, and has nearly the same characteristics as the yellow oak. Acorns from these could not be obtained this year. J. W. SMITH.

Milford, (N. H.) Oct., 1831.

FALL FEEDING CATTLE.

MR. FESSENDEN—Although the pastures look uncommonly green for the season, it is apparent, that the alimentary properties of the grass are beginning to be seriously diminished. Already, the cattle of some of my neighbors, especially those which are fed on outlands, look pinched, and are obviously falling away. This, I have frequently said to myself, is bad management. If they cannot be kept in a thriving condition at the present season, they should certainly not be suffered to fall away; for it is apparent that they will need the stamina which they have acquired, during the winter approaching. In respect to young cattle, this may not be as important, although their growth must be proportionally retarded; but in respect to *milk cows* and *working oxen* it is absolutely essential. Unless in a good condition, cows cannot be expected to yield a large quantity of milk, nor that of an excellent quality; for I take it as settled, that both the quantity and quality of milk depend much upon the condition of a cow. And in respect to working oxen, their powers of draught and endurance are, to a certain extent, in proportion to their good condition.

But by what means, it may be asked, shall the good condition of cattle be preserved, in consistency with economy? Will it answer, asks the farmer, to begin thus early to fodder my stock? To this, I would reply, that every farmer should have provided for the exigencies of this *precise season of the year*; and should have been taught to have thus provided, by his past experience. He should have raised a good crop of pumpkins; or, as these are somewhat uncertain, he should have sown a field of turnips, carrots, &c., to be fed on early. But as many farmers, may not have thus provided, the question will probably occur, is it economical to begin to fodder at this time, when cattle appear to be falling off in condition? In my own view, the proper answer is, *by all means*. But, it may be said, that beginning thus early in the season, the fodder will not last. Be it so; keep your cattle in good condition as long as it does last, and if necessary then buy more. Or, if they must be pinched, let it be towards spring.

If their solids have remained until that time undiminished, they will have something upon which to rely, should the fodder come short. Or which is, perhaps, a still better remedy for the anticipated evil, sell off your cattle, retaining only that number which you are *sure of keeping well*. Keep your cattle growing the whole year round—keep your milk cows, so that even late in the fall, their milk will not be seriously diminished from the quantity they gave in midsummer. Keep your oxen so that, if any accident befalls them, you would not be afraid to recommend as tolerable beef. These directions are all practicable; and if practised upon would be found, I doubt not, economical, strictly so.

But if you judge otherwise, you are at liberty to suppress what I have written, or disprove it, if you are able. Yours, G.

Berlin, Con. Nov. 1831.

The above remarks appear to us to be correct and judicious. Deane's N. E. Farmer coincides with our correspondent in some of his directions. In that work it is observed, 'The meanest fodder should not be dealt out first of all. The straw and the worst hay should be reserved to give them in the coldest weather; for it is then that they have the keenest appetites. When a farmer thinks that he has too much stock for his fodder, as will sometimes be the case, it is not best to pinch them in their allowance so much in the fore part of winter as in the latter part. For the cattle are more liable to be pinched with cold, in December and January than afterwards. And no man knows how favorable the latter part of winter may be.—Ed. N. E. Farmer.

INQUIRIES.

MR. FESSENDEN—Allow me to inquire whether chloride of lime has ever to your knowledge been used to cleanse musty cider barrels? would it be likely to injure the cider? A SUBSCRIBER.

By the Editor—A French journal asserts that tanned wooden casks of every description may be rendered perfectly sweet and wholesome by washing with diluted sulphuric acid, and afterwards with lime water and pure water. We do not doubt but chloride of lime would cleanse foul casks, though we never knew the experiment tried. If the casks were afterwards scalded with hot water, or even well rinsed with cold water, we should apprehend no injury to the cider.

Candied Raisins.—Having on hand several hundred weight of Smyrna raisins, which have become so candied, as to be unfit for ordinary use, I am induced to inquire, whether they may be profitably used, in making wine. If so, will you please state in your paper, an economical process for the same? Respectfully yours, E. B.
Berlin, Con. Nov. 1831.

MR. FESSENDEN—I received last spring from a friend in Paris, a package of garden seeds, among which was a paper labeled 'Tours Celery' These seeds resembled, if I rightly remember, small gourd seeds; but had no smell of celery, as is usual with the common seed. I planted them, soon after which the plants made their appearance, and have continued to grow vigorously, up to the present time. They are much larger than any celery plants I ever saw, and entirely unlike those of the common kind. They wear a dull silvery appearance; the leaves are as stiff and rigid as oak leaves, and the borders of

both stems and leaves are lined with prickles, nearly as sharp and stiff as thorns. The plants have no smell of celery. In the absence of any books which might help me to a knowledge of their use, if they have any, I am induced to request you to give me your opinion, provided my statements be so intelligible, that you can understand it. I may add, that the frost thus far appears to have made no impression upon the plants. I have neglected to earth them up, as they have grown, not knowing, that they would be eatable.

Yours, respectfully,
Berlin, Con. Nov. 1831. G.

We are not able to give the botanical name of the plant above described, and would be obliged to any friend who would assign it a proper appellation &c. The common celery is one of the varieties of a plant called *Apium* by botanists. Of these varieties we know of none except the *Apium petroselinum*, or Garden Parsley; *Apium graveolens*, or Celery and *Apium americanum*, or *Arracacha*.

PRESERVATION OF ICE.

MR FESSENDEN—In your paper of the 26th ult. a correspondent says he 'has experienced much difficulty in keeping ice through the summer,' and asks which are the most approved methods of constructing ice-houses, in general?

I have never built an ice-house, but I will state for the information of your correspondent, that in the spring of 1823 I purchased at auction a house in the vicinity of Boston. Some weeks after I took possession of my house, I observed a trap door through the floor of my wood-house; and on opening it, I perceived a hole—say ten feet square, planked at the four sides. This I supposed was an ice-house, and into it I put the next winter, six loads of ice, which kept well, and was a full supply for my family the succeeding warm season. Every winter since, I put into the ice-house about the same quantity (never varying more than a load) and the supply is always abundant.

My house stands on a gravelly hill, and the air passes under my wood-house, in every direction; and the wood-house floor is the only covering for the ice-house. I cover my ice with shavings.

I have supposed my ice-house, which probably did not cost more than ten dollars, a very superior one; for some of my neighbors lay in twenty loads of ice a season, and by midsummer, want to beg a piece of me.

Nov. 7, 1831.

ICE HOUSES.

MR FESSENDEN—My ice-cellar is a very simple and cheap affair. It is 12 feet every way, dug on a gravelly knoll. It has a stout cedar post, about 13 feet long, at each corner, and I believe four more posts between those, with a sill morticed on the top, all round, to keep them all in place. Outside of these posts it is planked with old cast off bridge plank, which were originally 5 inches thick, and I these are secured, not by nailing, but merely filling in behind with gravel. The roof is a common one, rather steep sloping of course to the ground, and shingled in the ordinary way; the door is at the east end. There is no floor between the ice and the roof. The ice may be taken out at any hour, but it is generally done early in the morning. Before the ice is put in, some small spars (round rails if you please) are placed on the bottom of the cellar, and brush put crosswise, so as to keep

the ice from touching the ground. The ice is sawed in blocks of 2 or 3 feet long and about 2 feet wide and packed in the cellar, side by side. When filled to the top, some straw or shavings are laid over to a considerable thickness, perhaps a couple of feet, and that is all. Some years, when the ice is thin, it is gone in September or October; but when it can be had solid and of a good thickness, after using it freely for all family purposes and occasionally for neighbors, some of it remains at the end of the year. The posts should be about 13 feet, so as to enter the ground a little at bottom, and rise a little above the top for the purpose of making a small bank outside to turn off the rain. The quantity put in is, I think, about 15 tons or loads.

Nov. 10, 1831. A MIDDLESEX FARMER.

BROOKFIELD, NOV. 11, 1831.

MR FESSENDEN—On reading the description of my ice-house in your last number it occurred to me, that I might not have been sufficiently minute on one or two points. The roof is so sharp and high, that it affords a convenient passage into the entry, above ground, at the end of the building, by a triangular door, made double and filled with charcoal powder. The double partition, which divides the pit, extends upward to the roof, leaving in it a door, through which the ice is easily introduced at the top of the pit. This door is closed, after the straw is deposited in the space above the ice. Thus one door, opening to the atmosphere, is sufficient for all purposes.

Yours respectfully.

P. CLEVELAND.

FORESTS.

MR FESSENDEN—It was with great pleasure that I lately noticed a communication, in your useful paper, on the propriety of planting and improving forest and ornamental trees in this country; as grand forests, to the most simple observers, may be considered as the *bulwarks* of nations. Perhaps no country is more endowed by nature with ornamental shrubs and trees than America; which by a little attention, might be transplanted to different vacant spots and add much to the beauty of the scenery, as well as wealth of the nation. On taking a survey of New England we are presented with thousands of acres of land in a barren, uncultivated state, which by being planted with forest trees, would enliven the prospect and add much to the value of the soil. The many varieties of flowering shrubs indigenous to this country, may be planted in the outlets and vacancies by the road side and would at once gratify the traveller and enliven such localities, to the benefit of its neighboring community.

At the present time perhaps nothing more attracts the attention of European cultivators and landholders than planting and improving forests, and cultivating fruits. Many thousands of acres of land once barren are now covered with a valuable growth of oaks, ash, and various trees, suitable to the climate and the public welfare. We also find that American shrubs are the pride of European flower gardens; and it is greatly to be hoped they will, as they merit, attract the attention of the present enlightened community.

OBSERVATOR.

1000 brads and sparrow-bills were lately made in one minute, by machines invented by Mr Charles Makepeace, of the Howell Works, N. Y. 1300 could be made in the same time.

HINTS TO FARMERS.

Never feed potatoes to stock without boiling or steaming, as this increases their nutritive qualities. Grind your corn with the cobs. It is better feed, and pays well for the trouble.

One bushel flaxseed, ground with eight bushels of oats, is better for horses than sixteen bushels of oats alone, and will effectually destroy the bots.

Never burn all dry wood in your fire place, nor use a fire place when you can get a stove.

Cut your trees for rails in February, as they are most durable.

Never dew rot your flax, unless you wish to render it worthless.

Never select your seed corn from the crib but from the stalk.

Never feed out your best potatoes and plant the refuse, nor sell your best sheep and keep the poorest.

A fat ox is worth more than a poor horse, and does not eat as much—a yoke and chain can be bought for less money than a wagon harness.

English and American Newspapers.—At a meeting lately held by the London Literary and Scientific Institution, on the subject of the restrictions on the British press, it was stated in debate that, in America, where newspapers are not taxed, 1,555,416 advertisements were inserted in eight newspapers in New York, where 400 English and Irish papers contained, in the same space of time, only 1,155,000;—that the twelve New York daily papers contain more advertisements than all the newspapers of England and Ireland—that the number issued annually in America is 10,000,000, while in Great Britain it is less than one tenth of that number. Advertisements, which in England cost \$17, are inserted in America for about \$150; and an article which costs annually for advertising in the United States \$28, is liable in England to a charge of \$900.—*Boston Telegraph.*

The 'Revue Encyclopedique' of January last, speaking of the specimens of American silk which were sent to France for examination, says—'It cannot be doubted that plantations of mulberry trees will rapidly increase in the republic. American silks may, perhaps, soon supplant, in the markets of Europe those of the Indies and China.'—*Western Teller.*

It was computed, some years since, that no less than 112,000,000 pounds of butter are annually consumed in London, chiefly made within 40 miles round the city.—From the three counties of York, Cambridge and Suffolk, there are annually sent to the capital 210,000 firkins, amounting to 11,760,000 lbs.

The Camden (S. C.) paper mentions a squash vine at Hanging Rock Creek, which bore ten squashes. One measured 6 ft. 6 in. in circumference and 122 lbs; another measured 5 ft. 10 in. and weighed 96 lbs. This beats everything! They must have been mammoth pumpkins.

Dutch wives generally assist their husbands in their business, often taking the most active share in it; and it is a common remark in Holland, that where the women have the direction of the purse and trade, the husbands seldom become bankrupts.

WORCESTER CATTLE SHOW.

Report on Domestic and Household Manufactures.

The Committee of Domestic and Household Manufactures respectfully Report:

That they have been instructed to notice as particularly as possible the elegant articles of work-man and woman-ship, which were presented for their examination, by wholesale; and if the detail, thus necessarily by retail, be longer than the Society's patience, they can plead the old apology for tediousness, that there was not time to make it shorter. As the duties commonly divided between two committees have been assigned to them, they confidently ask double indulgence for their discharge.

Beginning at the foot of the list, they viewed sides and soles of Leather, and awarded to Messrs Caldwell & Sprague of Fitchburg, a premium of \$8. The specimens offered by Col. Jacob W. Watson of Princeton, would, if it had been permitted, have divided the pecuniary testimonial of approbation as they did the good opinion of the committee.

They award to Messrs E. & G. Bowen of Leicester, for the best manufactured Calf Skins \$8, and if other premiums had been offered by the Society, the committee would gladly have presented them to Messrs Caldwell & Sprague of Fitchburg, and Phineas Davis, Esq. of Northboro', for the excellence of their productions.

Sole Leather for exhibition solely, was presented by Messrs Merrick & Dowley of Worcester, was made in New York beyond the Society's jurisdiction to do good, by encouraging merit. It was superior to the manufactures of our own County in weight, compact texture, and mature preparation. It had evidently been subjected to a process more slow and sure than that hasty method too much in use, by which the material of the ox who walked on his own feet one day is trodden under other feet in a few more, and makes the perishable sole a mere strainer to separate the solid earth beneath, from the waters which pour through to an unwelcome introduction to the person's estate over. A reasonable horned beast might feel pleasure in parting his outside garment for the purpose of converting a part of himself into a fabric so durable and excellent.

The premium offered for Morocco Leather was unclaimed by any competitor.

One step further, were a pair of Ladies' Slippers, constructed by Mr Scott of Worcester, with so much neatness, that unless the manufacturer should be disposed to object, the committee would say to them, last for ever.

These shoes were placed on Carpets of tints as various and almost as bright, as those of the rainbow. Having regard alike to durability in use and apparent economy of materials, the first premium of \$12 was awarded to Mr Solomon Sherman of Northboro', and the second to Miss Hannah Brown of Rutland. The third was bestowed on Miss Hannah Ruggles of Hardwick, for good taste in the selection and arrangement of colors. To Miss Melissa Pierce of Paxton, Col. Artemas Ward, 2d, Mr William McFarland, and Mr Willard Brown of Worcester, Mrs Melitable Davis, and Col. Merrill Davis, the committee unanimously award thanks for exhibiting such beautiful examples of household skill.

The best Flannel was that of Miss Thirza Nichols of Charlton, well entitled to the premium of \$6; the next best that of Miss Lucy Marsh of

Sutton, to whom should be given the second premium of \$5. Col. Merrill Davis of Holden, and Col. Joshua W. Leland of Grafton, will feel no uneasiness on finding their good works excelled only by the skill of the ladies.

The Wove Coverlet of Mrs Jerusha Merriam of Oxford, received the premiums of \$4, and Miss Thirza Nichols of Charlton, of another of \$3. Those of Mrs Melitable Conyers, Mrs Lois Stephens, Miss Nancy Conyers of Oxford and Miss Melissa Peirce of Paxton, came in near competition.

There was no Diaper of the width required by the rules of the Society. Had that of Mrs Jerusha Merriam of Oxford, or Mrs Hannah C. Stone of Oakham, extended to the proper distance beyond the end of the yard-stick, the Committee would have experienced difficulty in determining on the comparative merit.

To Miss Adeline Marsh of Sutton, for the best Woolen Stockings for men, they awarded the first premium of \$3, and believed the excellence of the article would deserve twice the amount if it could be bestowed.

Having thus passed on all the subjects for which specific premiums were offered, the Committee examined an immense collection of curious and cunning works of the needle, and some of them felt deep regret that they had no wives to comfort and advise in the doubts and difficulties which occurred in their progress among the rich and fair things which thronged the Hall. They have respectfully recommended small gratuities measured in amount, not by the merits of the object but the trifling sum placed at their disposal, not to be considered, as compensations for ingenuity, but mere tokens of that approbation for successful industry supposed to be more valuable than money.

Thirty elegant Black Lace Veils, of exquisitely finished design and execution were exhibited. To Miss Sophronia Lamb of Starbridge, the Committee recommend a gratuity of \$3, and another to Miss Brooks of Milbury of \$2.—Those of Miss Almira Pollard of Lancaster, Mrs Whitman Bates, and Miss Sarah A. Peck of Milford, Miss Sarah Benis and Miss Clarinda Watson of Spencer, Miss Eliza A. Wheeler of Southbridge, Mrs Joseph A. Denny of Leicester, Miss Martha Kendall, Miss Sophia Holbrook, and Miss Louisa Howe of Worcester, and Miss Martha Johnson of Southborough, were more beautiful and alluring than the best fabrics of Italy, and any spectator might have taken the Black Veil with delight from the hands of the fair artists.

Among the white lace work, was a handkerchief of Miss Charlotte Corbett of Worcester and a specimen of the union of 84 different kinds and infinite numbers of stitches by Miss Eliza A. Wheeler of Southbridge, and a Cap of Miss Pope of Dudley, aged twelve, were considered very beautiful. The Committee recommend a gratuity of \$1 each to Miss Almira Pollard of Lancaster, and Miss Abby B. Thomas of Worcester, for excelling where all was excellent.

Rose blankets and ticks, wide, warm, comfortable and sleepy in their looks, were wrought and brought to grace the occasion by Miss Dolly Heywood of Barre, Miss Mary E. Hitchcock of New Braintree, and Mrs Rebecca D. Patrick of Western. To the latter lady the Committee recommend a gratuity of \$2.

A goodly Plaid of Miss Hephsebah Wilcox of Brookfield, was worthy the name of Rob Roy which it bore.

The Linen made by Mrs Betsy Flagg of West Boylston, deserves a gratuity of \$1.

A gratuity of \$1 is requested for the Counterpane made by Miss Elizabeth Sargeant of Leicester, at the age of four years, and another for a Carpet made of shreds of cloths by Mrs Rachel Holmes of Sterling, at the age of 80—an affording evidence that the hand of female industry is busy in New England from life's earliest to its declining period, and that the ingenuity of usefulness which brightens its morning cheers the serene evening of its days of good works.

A Counterpane made by Miss Martha Putnam of Worcester, was so excellent that the Society are invited to bestow a gratuity of \$1 on her.

While bed and board were so plentifully supplied, our fire-sides were not neglected. There were six beautiful Hearth Rugs exhibited by Mr Jonas Pollard of Bolton, Mrs Elizabeth Nichols of Worcester, Mrs Almira Warren of Grafton, Mr Onis Stearns of Leominster, Mrs Mary White of West Boylston, and Miss Polly Whitney of Worcester. On the two latter ladies, the committee ask you to bestow a gratuity of one dollar each.

The Society have annually offered premiums for bonnets made of fowl meadow or other indigenous grass. It has been found that such fodder may better be left to cattle and sheep, to be left by them at their discretion as it has been by the ladies.

A neat Straw Bonnet prepared by Mrs Aurelia White of New Braintree, is deserving a gratuity of \$2.

Messrs Putnam & Perkins of Lunenburg, exhibited Palm Leaf Hats well worthy a gratuity of \$2, and Miss Eleanor Hemenway should have an allowance of \$1 for nicety in the manufacture which concerns the heads of all. Miss Chloe Carter of Berlin, Miss Clarissa Nelson of Sterling, and Messrs Livermore & Benis of Spencer, furnished fine specimens of the same article.

Mr Nathaniel Teed of Shrewsbury, and Messrs J. P. Kettell & Co., of Worcester, offered superior Beaver hats; the Committee beg for them a gratuity of \$1 each.

J. R. Tyler furnished a fine Fur cap, which made one desire cold weather to enjoy the luxury. It did not, however, come within the territorial jurisdiction of the Committee in its manufacture.

Flowers of glorious tint were in their full bloom on several neat little examples of the skill of Miss E. A. Bartlett, Mrs Levi Heywood of Worcester, Miss Pope of Dudley, and Miss Frances T. Merrick of Worcester. They were called Lamp Rugs but were so beautiful as to deserve to be admitted into the dairy as cushions for milk pans.

Cards of Penknives were exhibited from the manufactory of Moses L. Morse & Co. of Worcester, of the workmanship of the apprentices in that establishment. The silver backed knife of Mr Judson W. Rice, and that of Joel C. Packard are considered as deserving a gratuity of one dollar to each of those young men.

A splendid card of highly finished Penknives and Razors were presented by Messrs O. Packard & Co. of Milbury, and the Committee recommend a gratuity of two dollars to them.

Razors, Lancets, and Surgical Instruments were furnished by Col. Harrington of Shrewsbury. Although the committee made no experimental trials of the latter, they were satisfied from the elegance of the appearance that they must be pleasant in

the operation and that he ought to have a gratuity of two dollars.

Silk was exhibited in all stages of its production from the first efforts of the insect spinners, to the matured results of a manufacture, which with proper encouragement may become the healthful and profitable employment of the inmates of every husbandman's household. Some of the operative silk weavers, with their cocoons, raw threads, and dyed fabrics were brought by Mr Benjamin Leavens, Jr. Raw Silk and cloth by Mr Lemuel Healey, and an economical fabric of the *lure* as it was described, by Miss Mary R. Pope, all of Dudley.

The committee feel no hesitation in soliciting gratuities of two dollars each to those persons for engaging in an enterprise which is of such importance to the household welfare of New England.

A Cape made from the floss of the Silk weed by Mrs John Davis of Worcester, came in competition with the delicate workmanship of the worm that weaves.

A very large and neat Needle Book presented by Mrs Patrick of Western, was commended by the committee.

Four pairs of elegantly finished Spectacles, manufactured by Messrs T. & W. Keith of Worcester, were examined with great pleasure. If their other visible properties were equal to their beauty, one might covet the imperfection of vision which would permit so graceful an appendage to his face.

Two very splendid Mirrors were exhibited by Mr William Wiswall of Worcester, the manufacturer. The beauty of the frames excited great admiration from the ladies, who looked towards them constantly. The committee recommend a gratuity of two dollars, for his works, which they hope will always afford him as fair reflection as they have this day given.

A child's Coach of tasteful proportions was exhibited by Mr G. Valentine of Northboro', which might well be recommended to all gentlemen contemplating a change to a better state, as an ornamental, and probably, useful part of domestic equipage.

A new use of an excellent vegetable was suggested by a very curious Work Basket, made of melon seeds, exhibited by Mr Nathaniel Teed of Shrewsbury.

The committee examined an elegant Mantle Piece, as was first supposed, of rich Italian marble; finding it was wood, painted by Mr Theophilus B. Western of Worcester, they recommend a gratuity of two dollars to him, as a testimonial of approbation for his skill in imitating the productions of nature.

Very delicate drawings on porcelain were presented by Mrs A. M. Wells, of the Female Academy in Worcester, evincing that the sister arts of painting and poetry are sometimes united in graceful perfection.

Our Friends, the Misses Earle of Mulberry Grove, again gave pleasant evidence that their pursuits are accomplished in the ornamental, as well as the useful, under good instruction. The committee recommend that the Society put two dollars into the beautiful purse among their collections, to be divided among the contributors of so many fanciful fabrics.

Umbrellas from the manufactory of Mr Aaron Leland of Worcester, of silk and cotton would be highly prized on a rainy day or any other.

That venerable gentleman kindly known by the affectionate appellation of Uncle Sam exhibited by his attorney, the Hon. John Davis one of his shooting tools in the shape of a Rifled Musket from the armory of the United States. The committee examined it particularly. As it had a bayonet fixed, a formidable lock, a spring barrel, and surprisingly fluent delivery of bullets, the chairman viewed it from safe distance. It seemed to be such an implement as would have been more useful behind such rail fence ramparts as New England once set on her heights, than for the elegance of militia parade.

A velvet work bag, whose very name implies indispensable use, made by Mrs Isaac Southgate of Leicester, attracted great attention. The committee ask that \$1 should be bestowed on her.

Machine Cards and Filleting of Isaac Southgate and Co. were very good.

A Mahogany Work Table, whose splendid tinted wood and nicely adjusted joints were suitable for ladies' use, and would make its possession enviable by the most luxurious of the land, was exhibited by L. Wood & Co. of Worcester.

Mr Caleb Newcomb presented a Tin Drum or cylinder of his own manufacture, which was highly approved by manufacturers.

Iron Castings by the Brookfield and Worcester Foundry were excellent in manufacture.

The Scythes of Col. Renben Waters were an exhibition of the preparation of that manufacture for foreign markets, conclusive to show they need not fear competition anywhere.

The Chairs of Mr Joel Pratt of Sterling, were worthy of the reputation of that town, and often enticed the Committee to do that which they wish all others to do, sit down on his manufactures.

Rich Shell Combs were exhibited by Mr George M. Rice, from the manufactory of Mr Alfred Willard of Boston, and were much admired by those who best could judge of their beauty.

Elegant specimens of Penmanship were presented by Mr Austin Goddard of Worcester and Mr Elisha Tucker.

Mr Oliver Barret of Bolton, presented a branch from his trees bearing half grown apples of the second crop, looking as if nature, not content with one unsuccessful effort for a harvest, had attempted to make two failures in the same year.

Large Radishes, Squashes, Corn Ears, and Sunflower Heads were presented by Mr Joseph Merriam of Grafton, and Mrs Greenleaf of Worcester.

A Threshing Machine, brought by Mr Patrick of Weston, was described as of great value. Accident prevented its operations being witnessed.

Many other persons contributed to the exhibition, embracing greater variety and number of articles than any former festival has afforded. To all who aided to increase the interest of the day, the committee recommend that the grateful acknowledgments of the Society should be tendered.

All which is respectfully submitted

For the Committee,
WILLIAM LINCOLN, Chairman

In a town containing about 1400 inhabitants, in a sterile part of New Hampshire, about 50 miles northwest of Boston, there were manufactured into starch, for the use of manufacturers, 45,000 bushels of Potatoes, at 20 cents per bushel, amounting to \$9000.

ANTHRACITE COAL.

An experiment has been made in Westchester of Anthracite coal as a substitute for wood in the burning of bricks. The Village Record alludes to it thus:—This experiment was made at the brick kiln of William Everhart, Esq. of this Borough. At right angles with the flues, and about four feet above the top of the arches, holes four inches square and one foot apart, were left running from the back side of the kiln to the front. In these were laid pieces of Anthracite weighing from half a pound to a pound each, and the whole put in the kiln was one ton. Ordinarily they burn about 80,000. At the time of making the experiment, 10,000 were added, making 90,000. The experiment was highly satisfactory. Mr Miller, the superintendent, mentioned to me that he tried it reluctantly, having little faith that coal so disposed, could do any good; but as Mr Everhart desired, he determined to try it. He was agreeably disappointed; the effect was greater than he could have imagined. The brick, he said, was better burnt than in the ordinary way. There was a saving of wood fully equal to the cost of coal used and ten thousand additional brick were burnt. Thus every month, some new proof is produced of the value of this exclusively Pennsylvania mineral.—*Phil. Inquirer.*

Temperance in Sheffield, Eng.—At a late Temperance meeting in Sheffield, in the proceedings of which James Montgomery, Esq. the poet, took part, Rev. Dr J. Pye Smith, one of the most distinguished Biblical scholars in England, at the close of his address, said:

'It would be presumptuous in him to say that a little wine or malt liquor should not be taken, but he trusted his friends would excuse him for mentioning his own experience on this subject. His chief beverage at present was water and milk. He was formerly in the habit of taking one or two glasses of wine, but since he had abstained from it he found that he was much better in health and strength, and better able to undergo the fatigue of his labors, than he was before. He had also known sailors, whose chief beverage was tea and coffee, better able to do their work than those who drank ardent spirits, and they were always less subject to disease.'

Modesty of dress in females.—A spirit of rivalry and emulation to excel in dress has frequently betrayed females of unquestionable character into wearing costumes which their modesty would sink from under ordinary circumstances. Exclusively intent upon their own adornment, they do not reflect upon the consequences that may result from their appearance in public. It is not surprising that the passions of men should be excited, and their principles shaken, when, in the street, in church, and in short, everywhere, such exhibitions are constantly placed before them. It cannot be doubted but that this cause daily operates to the deterioration of public morals and it is full time that it should receive the serious attention of parents and guardians. It has an immediate influence in lowering the sex in the estimation of men, since it lessens their reverence for persons they would otherwise always look upon with deep respect.—*American Encyclopedia.*

Fifty females lately arrived in a vessel from Maine, twenty of whom went to Mann's Factory, Franklin, and thirty to Lowell and Nashua.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, NOV. 16, 1831.

MR COBB'S MANUAL.

We have been favored with a small treatise entitled 'A Manual containing information respecting the growth of the Mulberry Tree, with suitable directions for the culture of silk, in three parts. By J. H. Cobb, J. M. Published by direction of his excellency Gov. LINCOLN, agreeably to a resolve of the Commonwealth. *Ostendens hujus muneris usum. Vida in Bombyx.* Boston. Carter, Hendee and Babcock.

This Treatise is introduced by an able report of a Committee of the Massachusetts Legislature, of which Mr Abel Wheeler was Chairman (published in N. E. Farmer, vol. ix. page 262) and a resolve 'That his excellency the Governor be requested to cause to be compiled and printed a concise MANUAL to contain the best information respecting the growth of the MULBERRY TREE, with suitable directions for the culture of SILK, and that this manual be distributed in suitable numbers in the city of Boston, and to every town in the Commonwealth. That to defray the expense thus incurred he be authorized to draw his warrant on the treasury for a sum not exceeding six hundred dollars.'

The importance of the silk culture in a national point of view, as well as a useful and profitable pursuit of individual industry, is now so well, and so universally appreciated that remarks on this head would be superfluous. We shall, therefore, confine ourselves to the indication of the claims of the treatise before us to confidence and patronage.

The author remarks in his preface that 'In preparing this manual he has been guided by the personal experience which he has had for several years in the culture of the mulberry tree, and rearing of silk worms in the state of Massachusetts.' He also gives a list of the works which he has made use of in compiling his manual, and subjoins the recommendation of Mr Peter S. Du Ponceau, and Dr Felix Pascale. Mr Dr Ponceau observes that 'the works of foreign writers on the cultivation of mulberry trees, and raising of silk worms, particularly in the latter, are by no means suited to the meridian of this country and are rather calculated to discourage than instruct our farmers. You have with great propriety discarded their artificial heat, thermometers, barometers, hygrometers, and all these variety of troublesome methods, minute regulations and useless implements, which make the culture of silk a difficult and intricate science. I see no more difficulty in cultivating the mulberry than any other fruit tree; and the art of raising silk worms seems to reduce itself to a few simple rules easy of observance. I know but of one European author who has had the courage to break through the fetters of habit and prejudice; and in a late work on the culture of silk published in the German language at Vienna in 1829, adopted what I call the *American system*, the same which your manual recommends, and which in fact has been followed in this country for more than 70 years. The author is the Chevalier Von Heintz, an Austrian nobleman, the owner of large estates in the imperial dominions. He appears to have completely succeeded by following this simple American method, and he even ventured to raise silk worms on mulberry trees in the open air on the frontiers of Hungary, 44 deg. N. Lat.; and

he assures us that he met with the same success.'

Dr Pascale observes 'I have read the work of Mr Jonathan H. Cobb on the culture of silk which is intended by him for a popular manual of instruction and have been much pleased to find that it unites brevity with all the most important precepts required in that valuable branch of domestic produce. It is also clear and lucid, and free of all unnecessary details little to be called for within the short period of time necessary to make a silk crop. It is evident that Mr Cobb has been many years a practical cultivator, and could also embrace the interesting cares of the silature even farther than that of making marketable raw silk which is not frequently attended to by the growers.' ***

'I conclude with observing that the work of Mr Jonathan H. Cobb deserves the confidence of the public and its circulation should be encouraged.'

Cobbett has just published a work entitled 'Advice to Young Men, and, (incidentally) to Young Women, in the Middle and Higher Ranks of Life.' It is written in his nervous, characteristic style and abounds with good sense and useful suggestions. Under the head of 'Advice to a Lover' he gives a 'round unvarnished tale of his whole course of love,' which is quite amusing, and which we shall re-publish next week.

AGRICULTURAL EXHIBITION.

The annual exhibition and cattle show of the Plymouth County Agricultural Society took place at Bridgewater, on Wednesday the 21 inst. The weather was fine, and the assemblage of people very great. The exhibitions were respectable; the manufacturers, however, were not so numerous as heretofore. The pens made a far better display of stock, than we think we have seen at any previous anniversary. After a choice of officers and other business, the Society moved in procession from the Academy to the hall of Mr Sampson, escorted by the Bridgewater Band, where the Farmers' banquet was served up in an excellence and plenty, accompanied with the pithy toast, the merry joke and cheerful song. At two o'clock they proceeded to the Rev. Mr Hodges' meeting-house, where they listened with much satisfaction to an address from the President of the Society, which was as might be expected, altogether appropriate and suitable to the occasion. In his introduction the speaker apologized in terms of much pleasantry and good humor, for the dryness of his subject, which was on the *best culture of soils* for vegetable produce. But the remarkable attentiveness of the audience showed in the result that no apology was necessary. The Reports of the respective Committees, with the premiums awarded to the various competitors, were next in order, a particular account of which will be given in the next Memorial, or as soon as may be together with a list of officers elected.—*Plymouth Memorial.*

Complaints are made in the Boston papers, that lumps of butter bought in the market for a pound, are found to weigh only thirteen ounces. The Boston people should have the market clerks furnished with a good set of scales and weights, and send them forth among the dealers in that glorious edible, let a few hundred pounds be confiscated to the use and behoof of the city and its officers and the pound will soon rise to sixteen ounces.

—U. S. Gaz.

MORUS MULTICAULIS.

Extract of a letter from Mrs A. Parmenter, of the Horticultural Bureau, Brooklyn, N. Y. to the Editor of the New England Farmer.

'I regretted to see in your interesting journal, Judge Burr's notice on the morus multicaulis, as I fear it will prevent the much desired increase of this valuable mulberry. Will you be so good as to state that I have some imported trees of that kind that have stood five years in a very exposed situation; and also many budded ones that are in a very cold and high place, and have stood two winters without injury.'

Horticultural Hall, }
Saturday, November 12, }

FRUITS EXHIBITED.

From Messrs D. & C. Landreth, Philadelphia, a basket of beautiful EHASSIERE Pears; they rank among the best fruits of the season.

From Mr R. Tooley, Waltham, a pear, (name unknown) erroneously called the 'Avora,' which is a summer pear ripening in August. From the same, some very fine Chaumontelle pears; Beurre d'Hyner; among the old varieties this is without hesitation the best early winter pear; it exhibits no signs of decay or blight, in the most exposed situations; its only fault is a disposition to rot before they are quite mellow; when any indication of this is discovered, they can be used for baking, for which purpose they are most delicious; when in perfection, they will compare with the best of the new varieties we are at present acquainted with.

From Mr Manning, pears called in James Bloodgood & Co's catalogue 'Leggett's fine Winter.' They were identified as the Martin Sec of the New Delham.

From Joseph Locke, Esq., of Billerica, German Muscat Pears.

From Mr Alexander Young, Boston, six of his large baking pears, weighing 7½ lbs; the largest weighed 26 ounces; this is no doubt a foreign pear, the true name of which is lost—the fruit is reserved for a more critical examination at maturity.

From Messrs Winslow, Brighton, a beautiful specimen of the new Alpine Strawberry, with runners; this variety continues bearing from the earliest of the season to the present time.

The season has now arrived when it is requisite to suspend the weekly exhibitions of Fruits, &c, till the spring; should however any person have any new or valuable late varieties, they are requested to send specimens, as they come into eating, to the Hall of the Society, for examination.

In behalf of the Committee. R. MANNING.

The following Chrysanthemums were presented by Mr David Haggerston, of Charlestown, for premium:

Superb cluster yellow,	Qu Red white,
Tassel yellow,	Large and white,
Early blush,	Scarlet purple,
Two-colored red,	Crimson blue,
Yellow warriah,	Superb white,
Tassel blue,	Orange champagne,
Golden lotus,	Brown purple,
Dark macoon,	Quilled blue,
Quilled flame,	Double pink,
Flake orange yellow,	Rosa,
Pink small yellow,	Tassel white,

Two plants of the Pancerium Lily, sent to the Massachusetts Horticultural Society by Mrs Haggerston, were committed to the care of Messrs Haggerston and Winslow.

Concord vs. Portsmouth.—We have been presented with a common English Turnip, raised on the interval land in Concord, N. H. belonging to Mr John West, which weighs 8 lbs. 10 oz., and measures but 25 inches in circumference. This rather beats the turnip shown by Mr S. Spinney, of Portsmouth, which weighed 7 1-2 lbs. and measured 31 3-4 inches.—*Traveller.*

MISCELLANY.

The following extracts are from a small pamphlet lately published by Lilly & Wait, and Carter & Hendee, entitled
KNOWLEDGE FOR THE PEOPLE,
 OR, THE PLAIN
 WHY AND BECAUSE.

Why is port wine astringent and slightly rough?
 Because of the husks with which it is colored. The husk is, however, capable of communicating but a light color; when the red is deep, it is artificial, and a deep red color is never a desirable quality.

Why is port wine most commonly exported in full pipes?

Because port being of a strong and full body, and containing much mucilaginous extractive matter, the secondary fermentation is quickened by the greater bulk of the fluid, and the wine is thus most effectually mellowed in large vessels.

Why are brandied port wines of inferior quality?
 Because the original wines being of inferior growth, would not bear sea-carriage without some preparation, and the shipper is forced to mix them with brandy, which, though it may prevent them from spoiling, renders them otherwise worse than before, as it destroys what little flavor they originally possessed.

Why is the blackthorn or sloe important in the tricks of trade?

Because, by some knavish dealers, the leaves are used to adulterate and to give a rough flavor to tea; the berries of the sloe likewise enter pretty largely into the composition of much of the wine that is miscalled port.

The following is stated, by a London chemist, to be an analysis of a cheap commodity, sold under the denomination of port wine: spirit of wine, 3 oz.; cider, 14 oz.; sugar, 1½ oz.; alum, 2 scruples; tartaric acid, 1 scruple; strong decoction of logwood, 4 oz.

Why are deep cellars cool in summer and warm in winter?

Because of the earth conducting heat but slowly, and frosts penetrating it but a few inches.

Why are some fruits improved in sweetness by drying or half withering on the trees?

Because their watery parts thus exhale, and the sugar is virtually increased in quantity.

Why should grapes hang on the vine until they are perfectly ripe?

Because unripe bunches never get any riper after they are gathered.

Why should grapes be eaten soon after they are gathered?

Because, unlike other fruits, grapes do not improve in flavor after gathering.

Why should the crowns be removed from ripe pine-apples?

Because, when suffered to remain, they live upon the fruit till they have sucked out all the goodness.

Why does an apple, when cut, first appear white, and after a time brownish?

Because a fermentation arises from the rest of the fruit absorbing the oxygen of the atmosphere; the apple having previously been, by its tough skin, protected from the contact of the air.—*Donovan.*

Why should raspberries be eaten from the bush?

Because their flavor is the most fleeting of all fruit. Even a few hours will diminish it, and on the bush the flavor does not continue above two or three days when gathered, the flavor is almost entirely gone.

Why has the barberry been banished from the hedgerows of England, where it formerly grew in great abundance?

Because it was generally believed to be injurious to the growth of corn. This belief has been treated as a vulgar prejudice; but the fructification of the barberry is incomplete, unless the stamens be irritated by insects, when the filaments suddenly contract towards the germ. The flowers are therefore, by a beautiful arrangement of nature peculiarly attractive to insects; and thus barberry may become injurious to neighboring plants.

Why are chestnuts best preserved through winter in sand?

Because, if there be any maggots in the chestnuts, they will come out, and work up through the sand to get air.

Why is fern preferable to straw for the bed between the layers of fruit?

Because it does not impart that musty flavor which is so often produced by the straw.

Why are the autumnal fruits, as plums, pears, &c. more crude and indigestible than those of summer?

Because, in part, of the state of the constitution. Thus, at the commencement of summer, the system is more nerved and braced by the atmosphere of winter and spring, and by the drier food which necessarily obliges us to take at those seasons; so that the cooling fruits of summer are wholesome from their opening the bowels, &c. But it is not wonderful that a continuance of watery and immutinous food like fruit, should, towards the autumn, produce debility in constitutions partly predisposed to it, by the continual and relaxing heat of the summer months.

Why should juicy vegetables be kept in heaps in damp places?

Because they are then preserved moist, but if spread out, the air soon causes them to shrivel.

Why are the turnip, the radish, and the cabbage, considered very wholesome?

Because of their high antiscorbutic powers, which depend upon a certain acid volatile oily principle. This is particularly abundant in the seeds of mustard, and the roots of horse-radish; and in less degree in scurvy grass and the roots of the radish. Plants of this order are also believed to possess diuretic and diaphoretic properties; and they are always eatable when their texture is succulent and watery, as in the roots of the radish and turnip, and in the leaves of the cabbage tribe.—*London.*

Why are kitchen vegetables, as peas, French beans, &c. sometimes difficult to boil soft?

Because of the great quantity of gypsum imbibed during their growth, and not on account of the coolness of the season, or rains, as has been generally supposed: to correct this, throw a small quantity of subcarbonate of soda in the saucpan with the vegetables, the carbonic acid of which will seize upon the lime in the gypsum, and thus free the vegetables from its influence.

Why should potatoes and similar roots be stored with the earth adhering to them?

Because they are thus kept damp, whereas by removing the earth, the little fibres by which it is retained are wounded, and the evaporating surface is increased.

Why are potatoes the most nourishing of all vegetables?

Because of the quantity of starch they contain. Salop, tapioca, and sago, chiefly consist of starch, and are proportionately nutritious.

FRUIT TREES.

For sale at the KENRICK NURSERY, in NEWTON, near BOSTON, a most extensive assortment of Apples, Peas, Peaches, Plums, Cherries, Apricots, Nectarines, Almonds, Mulberries, Quinces, Raspberries, Gooseberries and Currant bushes, Grape Vines of the best foreign sorts, and 25 finest varieties of Strawberries, including the most rare, productive and esteemed.

Also about 400 varieties of the most hardy ornamental trees and shrubs, and superb hardy roses, including Silver Fir, varieties of Spruce, Flowering Horse Chestnut, Flowering Catalpa, Mountain Ash with beautiful clusters of red berries in autumn and winter, Purple Acacia, Three Thorns and Thornless Acacia, Butternut, Ailanthus or tree of Heaven, Elm, American and Scotch, Sugar Maples, Weeping Willows, &c. do. Napoleon from St Helena tree, Honey-suckles. Many of the above sorts of trees of extra sizes, for ornamenting highways and commons.

WHITE MULBERRIES, genuine sort for silk worms, by the 100 or 1000, for 12 weeks.

ISABELLA and CATAPAWPA Grape Vines, either singly or at reduced prices by the 100 or 1000.

CHINA ROSES, CHINESE CHRYSANTHEMUMS, GERANIUMS, &c. &c.

Written orders addressed either to JOHN or WILLIAM KENRICK, NEWTON, are regularly received by the daily mail, and will be promptly attended to, or they may if more convenient be left with J. B. Russell, at the New England Farmer office, where also, catalogues may be obtained gratis on application. But purchasers are invited when convenient to call and examine the trees, &c. for themselves, and make their own selections; but when this is not convenient, then let them forward their orders, relying that the very best possible selection will be made for them. Trees when destined for a distant place, are carefully packed either in clay or moss, and sent, and delivered whenever ordered in Boston free of any charge for transportation. ep1D1 Oct. 19.

Ammunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDERSTORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be refunded. J ao.

Pear Seedlings.

For sale at the Agricultural Warehouse, No. 52 North Market Street—

PEAR SEEDLINGS, of vigorous growth, and promising appearance, raised within six miles of Boston, in fine order for nurseries—the largest size from 18 to 24 inches in length, the whole plant; price \$10 per thousand; the second size from 12 to 18 inches in length, price \$5 per thousand. They will be suitably packed as wanted, for transportation to any distance. Oct. 19.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

Printed for J. B. RUSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for printing received by J. B. RUSSELL, at the Agricultural Warehouse, No. 52 North Market Street.

PLANTING SEEDS OF FRUIT TREES. RINGBONE IN HORSES.

MR. FESSENDEN—Last year I put into the ground, in October, a quantity of peach-stones, and various kinds of plum-stones; and none of them came up, owing, probably, to their not having been properly managed. Will some of your correspondents be so good as to inform me, through the medium of your paper, the proper course to pursue in planting fruit seeds and stones?

I have a colt, one year old past, that has a bunch on each hind foot, half way between the joint and hoof. Some persons, in the vicinity say they are ringbones, and others that they are not. Perhaps some of your readers may have known a similar case, and can prescribe a remedy. I also wish to be informed what are the first symptoms of ringbone in horses, and the best mode of treatment.

By replying to these inquiries you will very much oblige a young and inexperienced farmer. *Maine, Nov. 14, 1831.* M.

Remarks by the Editor.—We cannot pretend to say what was the cause, which prevented the vegetation of the stones of the fruits mentioned by our correspondent. The season might have been too wet, or too dry, or the seeds might have become too dry before they were planted, or mice might have eaten them; which is said to have been sometimes the case when seeds are planted in autumn, (an accident which we believe may be prevented by soaking seed in train oil, previous to planting.) It is recommended by Dr. Darwin to plant the fruit together with the seed of stone fruits, soon after the fruit is ripe, as its pulp was designed by nature to nourish the young seedling.

With regard to the supposed ringbone, we will give such descriptions of the disorder and its remedies as we have at hand, without pretending to any experimental knowledge of the subject.

White's Treatise on Veterinary Medicine, vol. iii. page 246, gives the following notices of this disease.

'The bony excrescences on the pastern, which constitute ringbone, are not always productive of lameness; this happens only when they are so situated as to interfere with the motion of the small pastern or coffin joint. In the latter situation they occasion more considerable lameness than in the former. I have in several instances known horses have ringbone on the hind pastern, without suffering the slightest inconvenience from them, and the last I met with went through the hunting season, without any appearance of lameness. I have found that the only chance that we have of curing ringbone or the lameness arising from it is a free application of the actual cautery (searing with a hot iron) and blistering immediately afterwards; and even this will not succeed if the ossification (becoming like bone) has gone so far as to fix the ends of the bone or glue them as it were together, so that the motion of the joint is completely lost. It is necessary, therefore when a horse is observed to be lame from this disease, to have recourse at once to firing. I

would by no means trust to a blister alone; for though it may sometimes at a very early period, succeed, there is even then a chance of the lameness returning. When blistering is employed, it should always be repeated two or three times, washing off each blister about the third day after its application, and keeping the part cool in the interval with Goulard's lotion.' [Vinegar saturated with white lead composes what is called Goulard's Extract. Goulard's lotion is made by mixing one ounce of said extract with one quart of water.]

Mr Barnum, in the *'Farmer's Furrer'* observes that.

'An ill shapen hoof is frequently the cause of ringbone; such as a short upright hoof, which does not sufficiently secure the articulation of the coffin and pastern bones against injury are most liable to this disease. Lameness is frequently the first intimation we have of the existence of ringbone, which is at first generally neglected. It may be ascertained by passing the hand down from the fetlock to the edge of the hoof, when you will feel one or more bunches. It consists in the ossification of the cartilage in front of the foot which extends in time to the lateral parts also. It most frequently happens in the fore-foot.

REMEDY.

'As a high heel usually accompanies the short upright hoof the concessions of the foot may be lessened by lowering the heel. Blistering is the most effectual application at the first appearance of the disease. Firing in the more advanced stages will have a good effect. But when the disease has been of long standing we doubt whether it can be removed.

POTATOES.

MA J. B. RUSSELL—I have put on board the sloop Merchant, Captain Burgess, a barrel of potatoes, which I hope will reach you safely. The barrel contains the following varieties.

No. 1. Early red, a good potato, but does not yield very well.

No. 2. Black, a very good potato, and yields abundantly; I think more than any I ever saw, that were so good in quality; the only objection to them is their color; I put more of them than any of the others in the bbl. that you may try them a few times.

No. 3. Light red, very long; these are not very good except for baking. I selected them chiefly on account of the shape, as I never saw anything of the potato kind (except the sweet) like them.

No. 4. Early White, very good, yields about the same as the Early Red.

No. 5. Blue, yields well and is a very good potato.

No. 6. Large White—the same.

I would observe that none of them are so good as I have generally had them, last season being wet and hot weather; so that all potatoes that grew near the river were struck with the rust, before they were full grown.

I have found since I came to this state that some kinds of potatoes which were very good here did not do well in Massachusetts; and those that were esteemed with you did not do so well here, but

the latter was not so often the case. Those sent I selected from 167 distinct varieties, and hope some of them will suit your climate. I cannot expect to do much, as there are so many who have more time to devote to this subject than I have; and it requires more time, and care, to keep so many kinds separate till they are fit to use, than those who have not tried it are aware of. I think that the black potato will be valuable at least for cattle, as they yield so abundantly, and the shape is favorable for the cattle's eating and not so much danger of choking them as round. The color is no objection for this purpose and the quality of the potato is nearly as essential to quadrupeds as *bipeds*. As they are, they are at your service, to do what you think best with them; if they should be of any service to the community I shall be glad, and if not I shall have the satisfaction of trying.

To say anything of the value which your labors are to the farming interests would be saying that which every one knows, and which to you must be trite, as you no doubt hear it every day.

I am, sir, very respectfully,
Your obt. humble serv't,

JOHN BENNOCK.

Orono, Me. Nov. 1831.

MR BENNOCK has our thanks for his exertions in disseminating new varieties of this valuable root. The Potatoes are received and we shall be happy to distribute them among such of our subscribers as will apply for them.

DOLICHOS SOJA OR SOY BEAN PLANT.

HAVING received a few of these beans, described by MA NUTTALL in the *New England Farmer*, vol. viii. page 105, I planted eight of them. They yielded a wine pint of beans in the Autumn, weighing $11\frac{1}{2}$ ounces; 110 beans, taken promiscuously, weighed half an ounce; so that in this proportion, my eight beans afforded me 2530 or more than 316 for one. I do not know whether they have been yet introduced into domestic use as a culinary pulse; but, should their qualities be good they cannot fail of being generally cultivated on account of their great productiveness. Their stems grow to the height of about two feet, and require the support of a few sticks or brush. H.

Milton, Nov. 1, 1831.

'TOURS' CELERY.

MR FESSENDEN—I observed a communication in your last number respecting some plants, the seeds of which, your correspondent received from Paris, for 'Tours' Celery. I thought by your remarks, that you supposed them some variety of Celery. At your request, however, I will give you, what I should think from reading the description, their true, or botanical name. I have now growing in my garden a plant which compares exactly with those described. The seed I received from the Mass. Hort. Society, in the spring of 1830; they came from France with a number of other packages. It is called the Cardoon of Tours, *Cynara cardunculus*, and is esteemed by the French an excellent vegetable. It is cultivated in the same manner as Celery, and is not fit for eating unless blanched. The stems and leaves being lined with prickles, make them

very difficult to manage. In France where it is grown in large quantities, a leather dress and gloves are worn to prevent injury from the little spines. Though considered rather tender, the plant I have stood out last winter without any protection. There are two varieties, the one described and the Spanish; the latter not having any prickles, is easily identified from the former, which is by far the best and the only kind grown on the continent. If these few remarks will be of any benefit to your correspondent you are at liberty to use them as you please. Yours, II.

Cambridge, Nov. 19, 1831.

From the Lancaster (Pa) Examiner.

SUNFLOWER OIL.

Mr Joseph Mann, of Salisbury, (Mass.) in a communication to the New England Farmer, states that after several trials made with sunflower seed, he was unable to obtain more than two quarts of oil from a bushel.—The process by which Mr Mann arrived at this result was a singular one altogether. He says 'we first made several trials by grinding and pressing, but in this way the most we could get was one quart and a half pint, from one bushel. We then heated the seed, and pressed it without grinding, but it did not succeed so well; we then ground and pressed it cold, and procured two quarts, and this was the most we could procure in any way.' Mr Mann adds:—'I presume the cause why it did not produce as much when hot pressed as cold, was that the heat of the seed when hot absorbed the oil more readily,'—which is very good philosophy.

It is precisely this absorption of the oil by the hull, that was the main cause of Mr Mann's 'decided failure.' Mr Barnitz of York, who cultivates the Sunflower extensively, succeeds easily in obtaining four quarts from a bushel of good seed—three quarts cold pressed and one by heating; but the hull is previously removed by an apparatus and process which Mr B. has patented. Hence the reason why the attempt to make oil proved unsuccessful and unprofitable, is not to be sought in any supposed unfitness of sunflower seed for such purpose, but in the inadequacy of the process employed by Mr Mann to effect it.

A German agricultural work, published at Halle, in 1824, has lately fallen in our hands, and we take this occasion to translate the following paragraphs from an article on the culture of the Sunflower.

Sunflower seed yields an excellent oil, richer than olive oil and yet equally bland and mild; it is also purer and more transparent, tinged with a slight shade of yellow. It is destitute of smell, and in taste somewhat resembles that of almonds. In Upper Saxony it is much used instead of olive oil. It is thought to be equally good and much more economical, as two gills of it will suffice where three gills of the other would be required. As a lamp oil it burns with a beautiful flame, producing no smoke and diffusing no disagreeable smell. Carriers have found it particularly useful in dressing leather, as it aids in imparting a permanent and clear black ebony.

The leaves of the Sunflower, among other uses to which they may be applied, are serviceable in the art of coloring. They are to be dried in the shade, by spreading them thin on a table or a clean floor and turning them frequently. A small handful of these dried leaves boiled in a pint of

soft water in a well glazed earthen vessel, with half a teaspoonful of alum added, is said to produce a beautiful and permanent yellow dye, but whether adapted to dyeing linen, cotton, or woollen goods, is not stated.

SUNFLOWER OIL.

A correspondent of the New England Farmer, Mr Joseph Mann, gives an account of an experiment in making sunflower oil, which was a complete failure; or rather an unprofitable job; and he thence concludes that the value of the article 'has been overrated by at least one half.' We beg Mr Mann to be assured the fault to which the failure in his case is properly attributable was not in the sunflower, but in himself. He merely resorted to the old method of extracting the oil, by which every body knows only about two quarts of oil can be obtained from a bushel of seed. As long ago as 1758 sunflower oil was made on this plan and with this result, and Mr Mann had no reason to expect a better product from the same process. The process he used was grinding and pressing the seed, by both cold and hot pressure, and the most he could obtain was two quarts. Now we can put him in the way of extracting four quarts of oil from a bushel of seed, and with the hope of inducing him to make another trial we will do so. The new process for extracting this oil, the credit of which belongs to Charles A. Barnitz, Esq. of York, Pa. is to clear the seed of the hull or shell and press the kernel by itself. The hull may be taken off readily by running the seed through a buckwheat hulling machine, or any other mill, the stones of which can be kept so far apart as merely to crack the hull as the seed passes through them. The great obstacle heretofore met with, in extracting this oil was the absorbing quality of the large quantity of hull. This is removed in the new process of Mr Barnitz, and if Mr Mann will try it he will find that his own 'wrong impressions' stood most in need of correction.—*Am. Farmer.*

CROPS ON THE CONTINENT OF EUROPE.

As the states of the crops in England and on the Continent are highly interesting to the growers and dealers in grain in this country, we have selected the following article from the London New Price Current of September as containing more information in a condensed form than any we have seen.

Having devoted latterly so much space to the Home Agricultural Reports, we now offer our friends, this week, a succinct account of the state and the result of the harvest abroad—commencing then with France, we find that the Grain is now almost secured in most parts, with the exception of the Northern departments, the anticipations as to an abundant produce have not been realized and are below an average growth; and in others from wet, the wheat has been materially deteriorated in quality, in which, in some instances, Barley and Indian Corn have participated.—Towards the South not only the quality has suffered but the quantity has fallen full one fourth short of an average; best descriptions of Corn therefore are being held at most of the principal markets at advanced terms, prime samples of new being scarce, and of old, the stocks are nearly exhausted. As to Italy and the Mediterranean, we hear from Naples, Leghorn, Ancona, Genoa, Rome and Trieste, that the produce is calculated to be near

ly one third below the usual quantity, that there are various grades of quality, and but a small portion of fine quotations are ranging high, and which are likely to be maintained. In Sicily, owing to the entire failure in the crops, the ports have been thrown open for foreign importation. From the Black Sea and the Crimea the appearances of the Crops are stated to lead to very satisfactory conclusions. At Tanageroe best qualities of old Wheat are very scarce, and at Odessa the supplies are not expected to attain the amount they have in ordinary years, owing to the political state of the most fertile provinces in the interior. In Spain the crops are tolerably good, but not so abundant as the appearances in spring indicated. In Portugal they have experienced much inclement weather and the crops are proportionally damaged the port of Lisbon is in consequence opened for the import of 27,000 qurs. of Wheat, and permission it is expected will be further extended next October or November.

As to Germany, the crops in the neighborhood of Magdeburg, the Saale, Marks, Anhalt and Brunswick are highly spoken of—the quality will exceed that of ordinary years in weight, averaging 60 to 61 lbs. and will reach 62 to 63 lbs. and even 64 lbs. imperial—the quantity will also be an average, though there are partial complaints of rust and mildew, but not sufficient to effect the general produce. In Holstein and Mecklenburg the same remarks will be borne out, not excepting even the weight. Rye, on the contrary, has suffered much from blight, and is complained of as being thin and light.

In Pomerania and Silesia, the wheat crops are equally good and heavy, as those in Germany. From Dantzie we are informed that rye, from mildew, has suffered a diminution of 6 to 8 lbs. per bushel, and that wheat has also been injured by blight, which it is feared will affect the produce, and lessen the chance of fine quality being procured. In Poland there is little doubt but a small breadth of ground has been sown this season as compared with former years; fortunately the growth seems nearly, by a superabundance, to have made up for the deficient extent. The supplies, however, from thence will depend entirely upon political results. From Russia we receive no complaints as to the produce of the harvest. In Norway and Sweden the crops are likely to prove satisfactory to the anxious farmers, and to repay them the failure of the preceding growth. Barley and oats, with a few exceptions, in all the Northern countries, promise well as to quality, though in some districts the yield of barley will not fulfil the expectations. In Canada the crops are described as most promising, and that the season has been highly favorable to the blossoming of the wheat, so that a good quality may be looked for, and cultivation has this year been considerably extended, and it is said a fifth more seed of wheat has been sown, which would enable an extra export next season of 3,000,000 bushels. In France, Italy, Germany, Prussia and Russia, the stocks of old wheat consist almost entirely of inferior qualities, and best descriptions can only be expected from the new produce.

We have received from Prince Edward's Island, N. S. the first cargo of grain, consisting of wheat, barley, and oats. The wheat is good red Canadian quality, and the oats plump, and apparently Irish seed of improved growth.

From Collett's Advice to Young Men.

COBBETT'S COURTSHIP.

When I first saw my wife, she was *thirteen years old*, and I was within about a month of *twentyone*. She was the daughter of a serjeant of artillery, and I was the serjeant-major of a regiment of foot, both stationed in forts near the city of St. John, in the province of New Brunswick. I sat in the room with her, for about an hour, in company with others, and I made up my mind that she was the very girl for me. That I thought her beautiful is certain, for that I had always said should be an indispensable qualification; but I saw in her what I deemed marks of that sobriety of conduct of which I have said so much, and which has been by far the greatest blessing of my life. It was now dead of winter, and I of course, the snow several feet deep on the ground, and the weather piercing cold. It was my habit, when I had done my morning's writing, to go out at break of day to take a walk on a hill at the foot of which our barracks lay. In about three mornings after I had first seen her, I had by an invitation to breakfast with me, got up two young men to join me in my walk; and our road lay by the house of her father and mother. It was hardly light, but she was out on the snow, scrubbing out a washing tub. 'That's the girl for me,' said I, when we had got out of her hearing. One of these young men came to England soon afterwards; and he, who keeps an inn in Yorkshire, came over to Preston, at the time of election, to verify whether I was the same man. When he found I was, he appeared surprised; but what was his surprise when I told him, that those tall young men, whom he saw around me, were the sons of that pretty little girl that he and I saw scrubbing out the washing tub on the snow in New Brunswick in the morning.

From the day that I first spoke to her, I never had a thought of her ever being the wife of another man, more than I had of her being transformed into a chest of drawers; and I formed my resolution at once, to marry her as soon as we could get permission, and to get out of the army as soon as I could. So that this matter was, at once, settled as firmly as if written in the book of fate. At the end of about six months, my regiment, and I along with it, were removed to Fredericton, a distance of a hundred miles up the river of St. John; and, which was worse, the artillery was expected to go off to England a year or two before our regiment! The artillery went, and she along with them; and now it was that I acted a part becoming a real and sensible lover. I was aware, that, when she got to that gay place, Woolwich, the house of her father and mother, necessarily visited by numerous persons not the most select, might become unpleasant to her, and I did not like, besides, that she should continue to work hard. I had saved a hundred and fifty guineas, the earnings of my early hours, in writing for the paymaster, the quartermaster, and others, in addition to the savings of my own pay. I sent her all my money, before she sailed; and wrote to her to beg of her if she found her home uncomfortable, to hire a lodging with respectable people, and, at any rate, not to spare the money, by any means; but to buy herself good clothes, and to live without hard work, until I arrived in England; and I, in order to induce her to lay out the money, told her that I should get plenty more before I came home.

As the malignity of the devil would have it, we were kept abroad two years longer than our time, Mr. Pitt (England not being so tame then as she is now) having knocked up a dust with Spain about Nootka Sound. Oh how I cursed Nootka Sound, and poor Pitt, too, I am afraid! At the end of four years, however, home I came; landed at Portsmouth, and got my discharge from the army by the great kindness of poor Lord Edward Fitzgerald, who was then major of my regiment. I found my little girl a *servant of all work*, (and hard work it was,) at *five pounds a year*, in the house of captain Bissac, and, with hardly saying a word about the matter, she put into my hands the whole of my hundred and fifty guineas unbroken!

Need I tell the reader what my feelings were? —Need I tell kind hearted English parents what this anecdote must have produced on the minds of our children? Need I attempt to describe what effect this example ought to have on every young woman who shall do me the honor to read this book? Admiration of her conduct, and self gratulation on this indubitable proof of the soundness of my own judgment, were now added to my love of her beautiful person.

Now I do not say that there are not many young women of this country who would, under similar circumstances, have acted as my wife did in this case—on the contrary, I hope, and do sincerely believe, that there are. But when *her age* is considered; when we reflect that she was living in a place crowded, literally crowded, with gaily dressed and handsome young men, many of them really richer and in higher rank than I was, and scores of them ready to offer her their hand; when we reflect that she was living among young women who put upon their backs every shilling they could come at; when we see her keeping the bag of gold untouched, and working hard to provide herself with but mere necessary apparel, and doing this while she was passing from fourteen to eighteen years of age; when we view the whole of these circumstances, we must say that here is an example, which, while it reflects honor on her sex, ought to have weight with every young woman whose eyes or ears this relation shall reach.

Sale of Blood Stock.—The annual sale of Stock, Horses, &c, at the residence of C. H. Hall, Esquire, was attended yesterday by between 200 and 300 persons. We were there for a short time only. The particulars of the sale were as under. Mr Doran, of the Bank Coffee House, prepared a sumptuous collation both at the house and in the fields.

At the farm of Henry Hall, Esq. at Harbom—by R. R. McIntire & Co.,—Durham, a full blooded short horned bull, \$400—Wye comet, a noted full blooded bull, 200—Norfolk, a full blooded Devonshire, 100; Henry, do. two years old, 65—Young Patroon, do. one year old, 80—White bull do. do. 100—20 various bull calves, from one year old, 25 a 20—1 Heifer, one year old, 105—1 do. do. 70—20 do. do. 32½ a 65—15 Cows, half blood, 20 a 45—30 Blood Calves, 15 a 45.

Horses.—Constellation, \$775—Talma, 1,125—Alert, black filley, 525—Bay Colt, 450—Sorrel Filley, 300—Ranger 3 years old colt, 575—Alarm, an imported mare, 575—Saupson, a 5 years old sorrel, 300—Express, 3 year old sorrel, 400—20 blood Horses and Filleys, from 100 a 375—Bakewell sheep, bucks and ewes, from 4 a 12.—*New York Standard.*

WORCESTER CATTLE SHOW REPORTS.

We should be glad to give all these reports at large, but have so many claims on our columns that some curtailments can scarcely be avoided. We hope to preserve the substance of those remaining though unavoidably shorn of some of their proportions.

ON SHEEP.

The Committee on Sheep observed that there is evidently an increased degree of attention bestowed by our farmers upon the improvement of their flocks, both as it regards the size of the sheep, as well as the quality of their wool. There is no one branch of our domestic industry, which bids fair at the present time to reward the farmer more richly for his trouble than that of wool growing. It is one which our soil and climate, and the wants of the community point out as more peculiarly appropriate for New England than almost any other. In the offering of premiums for Rams, the society have had regard to their size as well as the fineness of their fleeces. Deeming it to be an important consideration that the sires of our flocks should be possessed of all those qualities which it is desirable to have combined in their offspring, and which the experienced wool grower finds to be most conducive to the obtaining of quantity as well as quality of produce.

Fine wool commands the highest price in the market at all times and a flock of sheep producing the first rate of wool requires no more care and attention and consumes no more of the produce of the soil than one yielding fleeces of an inferior grade. If profit then be an inducement to stimulate the enterprise and exertions of our farmers, the growing of fine wool is a business, to which they will find it for their interests to devote more of their time and attention than they have for some years past. Our steep and rocky hills, which are too rough for profitable cultivation seem to be peculiarly appropriate and fit for rearing sheep, and the climate of this section of the United States is favorable for growing fine wool.

The Committee hesitated some time between the ram offered by Rejoice Newton, Esq. of Worcester, and one offered by Mr William Williams of Shrewsbury. They however awarded the premium for the best Merino Ram of seven dollars to William Williams of Shrewsbury.

The premium for the best merino ewes not less than 4 in number was awarded to the lot exhibited by Mr Edwin B. Taintor, of Brookfield. For the next best lot of merino ewes the premium was awarded to Rejoice Newton, Esq. of Worcester. For the best lot mixed merino sheep there was but one claimant. Mr Benjamin N. Child of Worcester, exhibited those which were considered by the committee as well deserving the premium of \$5 for their fine quality. For the best native ram the premium of \$5 to Ephraim Wilson of Barre. For the best native ewes, 4 in number, to Mr John Reed of West Boylston, the premium of \$4. A fine large and handsomely formed native ram was offered for exhibition only by Mr Otis Longley of Boylston. A lot of six native ewes of fine shape and size were exhibited by Mr Rufus Barton, of Millbury. A fine ram of the native breed with a slight cross of the merino blood was exhibited by Mr John Reed of West Boylston;—this ram was remarkable for weight of fleece, three shearings having yielded 20 lbs. and 11 ounces of wool. The fact of his having a cross

of the merino blood excluded him from coming in competition with the native rams for premiums. A merino ram of large size was exhibited by Mr Charles E. Miles of Shrewsbury, but for fineness of fleece not quite equal to those of Messrs Newton and Williams. A large handsomely formed native ram was exhibited by Mr Holloway Bailly of Northborough. Four very handsome merino ewes by Mr Samuel Sawyer of Sterling. Two fine rams by Mr C. Wheelock, Southbridge. One of these, a very fine woolled animal, being a cross of the merino and Saxony in equal parts. The other ram was of a large size and of a mixed descent from the common merino and Saxony breeds.

The reports concludes as follows: 'The committee have much pleasure in remarking the great interest that is manifested by the several gentlemen offering sheep for premiums for the improvement of the quality of their animals. There are probable at the present time but few flocks in Europe whose fleeces excel in points of fineness those of our own country's growth, and the time is not far distant they hope when all the wool wanted for our manufacturers will be grown by our own farmers.

WM. N. GREEN, Chairman.

ON WORKING OXEN.

Twenty-five pairs were entered for premiums; twenty strove for the mastery, and five retired from the contest. Although the committee have for many years witnessed the trial of strength they have never seen the contest so equally balanced. All the cattle were of a superior cast and displayed unprecedented power and fine discipline. The whip was little used and little needed. They awarded to Stephen Marsh, Jun. of Sutton, the 1st premium of \$12. To Thomas Harbuck of Sutton the 2d premium of \$10. To James Taylor Sutton the 3d premium of \$8 and to Arnold L. Allen of Shrewsbury, the fourth premium of \$5. The 4 years old cattle of Mr John Spurr of Charlton, entitled their owner to a gratuity of \$4. The 6 years old cattle of Mr Silas Allen, Jun. of Shrewsbury, and the 5 years old cattle of Mr Tyler Carpenter of Sutton were beautiful, and on any other occasion might have stood without a rival. This report was signed, ALEXANDER DUSTIN, Chairman.

The Report on Swine, like that on Manufactures is replete with humor which some critics may perhaps think misplaced and misapplied. But we like a little tomato ketchup to season more solid viands; and do not perceive why Judges of Swine need to assume, as badges of official dignity, faces as long as the phizzes of the animals, which come within their jurisdiction.

ON SWINE.

The judges of Swine, Report, that the duties assigned to them on this occasion, have been attended to with peculiar pleasure. Besides the general satisfaction, which they must of course, feel, in common with the other members of the Society, at the success which continues to attend the operations of the association, they cannot but take to themselves at the same time, a degree of honest pride, that they in particular, should have been selected for the commanding situation which they this day occupy. Far be it from them to magnify the importance of their office, and still farther be it from them to draw invidious comparisons between their duties and those of their less fortunate coworkers; but, with all becoming humility, and with all suitable expressions of diffi-

dence in their abilities to discharge the high duties imposed upon them, they must be permitted to remark, that, in their opinion, to be a judge of Swine, is an honor which might well satisfy the cravings of the most aspiring ambition. Nor is this all. Their duties, on this occasion, have brought them into close connexion with a most lovely portion of the animal creation. What animal for instance, can compare with the hog in personal neatness? Where else can he be found such gravity and dignity of demeanor? Who has not looked, with admiration, on the wonderful elongation of countenance, which the most pleasurable sensations can never distort into a smile? Who ever heard of a hog-laugh? The little cross accidents, which constitute so large a part of the sum of our miseries, can never disturb the calm serenity of his countenance. And who can fail to admire the elegance of his whole figure, and the grace of all his movements? But above all, who has not listened, with the most execrating interest, to the harmony of his voice? Who has not felt, when listening to his shrillest notes, as if he were 'all ear,'

'And took in strains, that might create a soul Under the ribs of death?'

And child her barking waves into attention, And fell Charibdis murmur'd soft applause.'

But, notwithstanding all the amiable qualities of this most interesting beast, it cannot be disguised, that he has been subjected to the most unmerited abuse. He has been slandered most foully. One class of the human family has been allowed to usurp the sovereignty of his name. The miserable drunkard, instead of receiving an appropriate appellation, has, by common consent, been dignified with the name of hog; and the scene of his disgusting orgies has, most unaptly, been called a sty.

This is wrong and oppressive, not to say unconstitutional, as all must allow; but your Committee have found themselves unable, (considering the great diversity of opinion, which prevails, at the present day, on almost every subject of general interest,) to devise any plan, which seems likely to furnish a complete remedy for the evil. They suggested to their *proteges* the expediency of muldification, but the idea did not strike them at all favorably. An appeal to the Supreme Court was recommended, but claiming to be themselves sovereign and independent, they thought it unsafe to refer their grievances to that tribunal, more especially as they had been told, that it was a mere tool of the Government. The establishment of a newspaper, in which their claims should be advocated, was hinted at; but, in reply to this suggestion, they said something about hollowhearted friendship, which your committee did not exactly understand. On the whole, no plan could be hit upon, which seemed more likely to effect their object, than a convention of swine, to be assembled at some suitable time and place, where the whole subject-matter could be fully discussed and considered. The first business of the meeting, would, of course, be to nominate suitable candidates for office; but the main object would be to pass resolves embracing the following sentiment: If any man shall, knowingly and wittingly, speak evil of a hog, he ought never afterwards to have a rash of bacon for his breakfast. The exhibition of Swine was large and very satisfactory. The whole number was 54.

The attention of the judges was first directed

to the boars, of which there were 8 offered for premium; 2 by Abel Warren of Northboro'; 2 by Lewis Bigelow, 2 by John W. Lincoln, 1 by Geo. A. Trumbull, and 1 by Wm. Eaton, all of Worcester. A very pretty little animal, too young for premium, was sent in, for exhibition only, by Ephraim Child, for which he deserves thanks. All were good, but not equally so. One of Mr Lewis Bigelow's boars, 6½ months old, was considered the best, and the judges, therefore, award to him the 1st premium of \$5. They had more difficulty in deciding, who was entitled to the next premium, but finally awarded to Geo. A. Trumbull, for his boar, 6 months and 7 days old, the 2d premium of \$3. The judges respectfully recommend an allowance for his travel, to Mr Warren of Northboro', as his animals certainly are deserving of much praise.

The Judges found in the pens, 5 breeding sows, owned, one each, by Oliver Fiske, Newell Rice, Wm. Eaton, Moses and Samuel Perry, and John W. Lincoln. They were all, without exception, beautiful females; but the one owned by Mr Rice was thought to be decidedly the handsomest, and the Judges, therefore, award to him the 1st premium of \$5. The sow, owned by Mr Lincoln, was in high flesh and doubts were expressed whether she would be on that account, so good a breeder; but she had too many good points to be passed over, and the Judges, therefore, award to Mr Lincoln the 2d premium of \$3. Dr Fiske's sow, also, is a very fine one, and the judges had evidence, that she is a capital breeder, having had at the age of 28 months, 4 litters of pigs, in all 44, but was not thought to be quite equal, on the whole, to those for which the premiums have been awarded.

The weaned pigs, being in all 37, were, with few exceptions, particularly beautiful. 8 were owned by Messrs Salisbury and Williams, 2 by Rufus Barrows, 2 by Ephraim Child, 3 by Newell Rice, 8 by Samuel Harrington, Jr, 2 by Wm. Eaton, 10 by Samuel Harrington, Jr and Elbridge Hewitt, and 2 by John W. Lincoln, all of Worcester. The Judges walked from pen to pen, and examined again and again, and were finally obliged to decide, not without some misgivings as to the correctness of their decisions. They thought, that two of Newell Rice's pigs, on the whole, were the best, and they award to him the 1st premium of \$3. They selected 2 from the lot of 8 belonging to Messrs Salisbury and Williams, which, they finally agreed, were second best, and they accordingly award to these gentlemen the 2d premium of \$2.

The Judges may have erred in their opinion, but they can only say, they have endeavored to judge rightly.

Very few of the owners of the swine were seen by the Judges, so that they could not ask questions as to the feed, &c, which they would have done, could they have had the opportunity. All of which is respectfully submitted.

By order. WALDO FLINT, Chairman.

CATTLE SHOW AT NORTHAMPTON, October 26th and 27th, 1831.

PREMIUMS AWARDED.

On Bulls—Elisha Ashley, West Springfield, \$6; Aaron Brown, Hatfield, 5; Roswell Field, Leverett, 4; Charles Cooley, Sunderland, 3. Bull Calves—Horace Cole, Chesterfield, 2; Pliny Meritt, Conway, 1.

Milch Cows—Thomas Johnson, Southampton, 5; Doctor B. Barrett, Northampton, 4; Joseph Lyman, do. 3; Asahel Pomeroy, do. 2.

Heifers, 2 years old—Daniel Newhall, Conway, 3; Orrin Percival, Chester, 2; Erastus Slate, Northampton, 1.

Heifers, 1 year old—Asahel Pomeroy, Northampton, 3; Daniel Newhall, Conway, 2; Aaron Burt, Longmeadow, 1.

Working Oren—Elisha Ashley, West Springfield, 7; Thomas West, Hadley, 6; Ahira Lyman, Jr., Northampton, 5; Cephus Strong, do. 4; I. C. Bates, do. 3; Joseph Williams, Williamsburg, 2.

Cattle for Stall—I. C. Bates, Northampton, 7; Elihu Clapp, do. 6; H. K. Starkweather, do. 5; Elisha Graves, do. 4; Asahel Strong, do. 3; Hiram Ferry, do. 2.

Steers, 3 years old—Aaron Brown, Hatfield, 5; Horace Cole, Chesterfield, 4; Hiram Ferry, Northampton, 3; H. K. Starkweather, do. 2.

Steers, 2 years old—Elihu Clapp, Northampton, 5; Daniel Newhall, Jr., Conway, 4; Asahel Pomeroy, Northampton, 3; Theophilus P. Huntington, Hadley, 2.

Steers, 1 year old—Moses Porter, Hadley, 4; Lucius B. Wing, Conway, 3.

Steer Calves—Asahel Pomeroy, Northampton, 3; Roswell Hubbard, do. 2.

Heifer Calves—Avery Howland, Conway, 3; Daniel Newhall, Jr., do. 2; Isaac K. Clapp, Easthampton, 1.

Merino Bucks—Pliny Sikes, Westhampton, 3; Joseph Williams, Williamsburg, 2.

Merino Ewes—Joseph Williams, Williamsburg, 3; Asahel Pomeroy, Northampton, 2.

Bears—Stephen Meacham, Chesterfield, 2; Zadock Lyman, Hadley, 1.

Sows for Breeding—Samuel Wright, Northampton, 2; John D. Smith, Hadley, 1.

Litter Pigs—John D. Smith, Hadley, 2; Sylvester Smith, do. 1.

Horses. Mares—Henry Shepherd, Northampton, 6; Milton Porter, Cunningham, 5; Isaiah Wing, Conway, 4.

Four years old Colts—Samuel Phelps, Northampton, 6; Samuel F. Lyman, do. 5; Justus Forward, Belchertown, 4.

Pairs 4 years old Colts—I. C. Bates, Northampton, 5.

Three years old Colts—Maltby Strong, Williamsburg, 5; John Cameron, Northampton, 4; Silas Rice, Williamsburg, 2.

Two years old Colts—Allen Sibley, Westfield, 4; Sylvester Belden, Chester, 2; Stephen Johnson, Hadley, 1.

One year old Colts—Ezra Adams, Bernardston, 3.

On blue Woollen Cloth—Eleanor Ward, Middlefield, 5; Rebecca Williams, Williamsburg, 3; Samuel Edwards, Jr., Southampton, 2.

Cloths other than Blue—Tryphosa Gray, Ashfield, 5; Theodosia Darling, Chesterfield, 4; Rhoda Williams, Williamsburg, 3; Submit Williams, Williamsburg, 2.

5-4 Undressed Flannel—Esther Bradlee, Russell, 5; Sarah Adams, Southampton, 4; Rachel Edwards, Southampton, 3; Nancy Russell, Chesterfield, 2; Jane Starkweather, Chesterfield, 1.

7-8 Dressed Flannel—Sally Ward, Middlefield, 3; Maria Burgess, Goshen, 2.

Floor Carpets—Sophia Smith, Hadley, 6; Martha Smith, Hadley, 5; Frances Lyman, Goshen, 4; Mrs Roland Burbank, West Springfield,

3; Clarissa James, Goshen, 2; Julia Ann Strong, Northampton, 1.

Hearth Rugs—Betsey Douglas, Westfield, 3; Louisa Stobbins, Westfield, 2; Julia Ann Arms, Conway, 1; Elizabeth Will-on, Deerfield, 1; Hannah White, Northfield, 50 cts.

Cotton Counterpanes—Thankful Burt, Northampton, 1.

Woollen Counterpanes—Clarissa Parish, Worthington, 3; Mary W. Metcalf, Middlefield, 2.

Ladies' Waxed Hose—Mary S. Metcalf, Middlefield, 2; Catherine Bardwell, Deerfield, 1.

Mittens and Gloves—Sarah Parsons, Northampton, 1.

Living Shredings—Esther Bradley, Russell, 4; Melinda Drake, Worthington, 3; Clarissa Parish, do. 2; Sarah Bardwell, Deerfield, 1.

Linon Shirting—Mary W. Metcalf, Middlefield, 1.

Linon Diaper, yard wide—Caroline Arms, Deerfield, 2.

Linon Diaper 5-8th of a yard wide—Clarissa Parish, Worthington, 2; Sarah Bardwell, Deerfield, 1.

Rose Blankets—Rebecca Eager, Worthington, 4; Hannah Lyman, Westhampton, 3; Miranda Bardwell, Deerfield, 2.

Butter—Polly Clark, Northampton, 3; Polly Pomeroy, Northampton, 2; Jerusha E. Warner, Northampton, 1.

Cheese—Dennis Webster, Conway, 3; Sophia Stebbins, Conway, 2; Theodosia Darling, Chesterfield, 1.

Straw Bonnets—Elizabeth A. Russell, Northampton, 3; Ruth Dickinson, do. 2; Mary A. Clark, Northampton, 1.

The Reports upon Household Manufactured Articles will soon be published together with the Report on the White Mulberry.

REMARKS—Number of Animals collectively, were more numerous than last year, and as to quality, the improvement very great.

On Bulls—Several fine Bulls which had received premiums in former years, were exhibited. The committee say they regret they were not authorized to award more premiums.

On Cows—Deficient in number and quality.

On Heifers—The committee say they were very fine. Mr Franklin Stow of Conway, exhibited a Cow and a pair of two years old Steer Twins, not for premium, but to show the stock; they were very fine; the Cow has had two pairs of twins. Some competitors could not certify, as the society required, of the milk, butter, or cheese, therefore a premium could not be awarded.

On Working Cattle—There was a good display as to numbers and quality. The committee regret they could not award a gratuitous premium to Maltby Strong, upon a pair of cattle of powerful draft, but too fat for working cattle. The cattle exhibited by Messrs Elisha Graves, Henry Shepherd, and several others, as working cattle, were very fine, but too fleshy for work.—The cattle of Mr Waldo Cleveland, were very fine, but not having been kept within the limits of the society the requisite time, a premium could not be awarded. The farmers of the county greatly mistake in, offering cattle for work, when better fitted for the stall. When such a fine lot of cattle are offered the committee must be puzzled to do exact justice to each competitor.

On Cattle for the Stall—The committee say the exhibition was creditable to the county.

On Steers and Steer Calves—The committee say

they were more numerous and superior to the exhibition of former years.

On Sheep—The committee report, that there is a great deficiency in the competition for premiums, and regret that such a profitable animal does not sustain a more prominent place at our annual shows.

On Sacks—More numerous than the last year and superior to former years.

On Horses—No Studs were offered. The exhibition collectively, not so numerous as that of 1828, yet there were some promising young horses. An improvement in the breed of horses for the saddle and draft is very desirable.

The exhibition of Household Manufactures was not so numerous as former years, occasioned by the severe storm of Monday being the last day of entry; however, there were some fine specimens of Household Industry.

PLYMOUTH COUNTY CATTLE SHOW

The Plymouth Memorial of Saturday contains the reports of the Committees at the Show on the 2d inst. at Bridgewater. A large number of premiums were awarded. In addition to the cash premiums several volumes of the New England Farmer were awarded to different individuals (one to each.) Fifteen dollars were awarded to Morrill Allen of Pembroke, for the best Dissertation on 'the mixture of soils to produce the best vegetable mould.' The exhibition appears to have been unusually large and respectable.—*Town Rep.*

Effects of Agricultural Societies.—No one can ride through the town of Wintthrop without observing the greater beauty of the farms, and the higher state of cultivation, than prevails generally in the State. This has been in a great measure effected by the Agricultural Society in that town; but in connexion with this there is another cause for a thrifty agriculture, viz. a cotton factory. Do not smile, reader; the factories of the Eastern States have been the impelling and most efficient causes of agricultural improvement and the increased value of land. They have furnished the ready home market for the wool, the hides, the fust, timber, beef, pork, hay, butter, cheese, apples, cider, potatoes, and a great many other vegetables, besides eggs, lamb, veal, and many other things, most of which cannot be exported because of their perishable nature, and for none of which there is any foreign market to be depended upon. The Agricultural Societies, agricultural publications, and the experiments and study of scientific farmers, have diffused that knowledge of husbandry which has enabled the farmers to supply, from the same land they before tilled, the increased demand created by the manufacturing cities, towns and villages.—*Kennebec Journal.*

An English saddler, named Tade, (says Le Petit Courier des Dames) has invented a shoe for horses. It is fastened on with strings of leather instead of nails, and is so managed that it may be put on or removed as the rider wishes or wants in less than a minute. The object of this invention is to enable the rider to replace at once during a journey any of the iron shoes which may be lost, and to continue his journey without fear of exposing the animal to the accidents which might result from the loss of a shoe. The lightness of the shoe, which weighs no more than half the iron one, and its portable form, as it can be carried with ease in the pocket or behind the saddle, are great improvements; a still greater is, that it may be taken off when horses are grazing, even for a short time.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, NOV. 23, 1831.

MANURE YOUR GRASS GROUNDS.

An intelligent and scientific cultivator, who wrote a number of valuable articles, which are incorporated into Messrs Wells & Lilly's edition of *Deane's Geographical Dictionary*, has given the following remarks on this subject, under the head *'Top Dressing,'* in that work.

'There is scarcely any question, on which farmers are more divided than as to the policy of applying manure as a top dressing to grass lands, in the spring or fall. The reasoning seems to be in favor of spring dressing, and it is supported by many excellent names. But it ought to be known, that intelligent farmers, near the metropolis, most generally dress their lands in autumn. Besides the reason stated above, that grass lands are less injured by carting over them in the fall; it may be added, that it is a season of greater leisure; and although it is confidently asserted, that the manure is wasted by rains and snows, yet much ought to be allowed on the other side, for the protection afforded by the top dressing to the tender roots of the plants during winter, and ought we not to add something for the low temperature of the atmosphere in winter, which prevents evaporation? whatever principles of fertility exist in manure, are in winter carried down into the soil. We are fully convinced that a scorching sun, and drying air, are more pernicious to manures, spread thinly over the surface than any drenching rains can be, unless on declivities where top dressings are unquestionably of less value than on level grounds. The fact that farmers who grow rich by supplying the great towns with hay generally adopt the practice of fall dressing their grass lands deserves weight.'

From the Boston Traveller.

Experiment with Anthracite Coal.—It has been considered a great difficulty in burning the anthracite coals now extensively used in our Atlantic cities, that the common fire places were not easily transformed into the proper receptacles for this fuel, nor grates easily adapted to the proportions of the room and the requirements of the coal for producing the necessary amount of heat. It has been thought there must be some nice rule applied to the construction of the apparatus—that the grate must be precisely of certain given dimensions; must be so many inches within the walls of the fire place, and of a particular elevation towards the opening into the chimney, whose throat shall in every instance exhibit the same limited capacity.

Now there may be a method in warming rooms as well as in any other employment, and undoubtedly much is gained by a careful attention to established facts in the use of grates; but we are prepared to show by actual experiment, that anthracite coal may be burned, not only without a flue of prescribed proportions, but without any flue at all or a chimney of any size. The grate made use of, was of a cylindrical form, swelled in the middle like a barrel, 15 inches in height; 12 inches the end and 16 inches the centre diameter; the wires or bars two inches apart, running in a vertical direction. We have not mentioned the proportions of the grate because precisely these were necessary to produce combustion; but merely to give a correct account of the experi-

ment. A grate larger or smaller would have produced the same result.

This apparatus was suspended in the open air, in a yard, for several days, both when there was a dead calm in the atmosphere, and when there was a slight breeze; and on every occasion, the coal ignited easily, and burned freely, steadily and handsomely, presenting a circular body of living fire, until the coal was nearly consumed.—The experiment pleased all who witnessed its operation; and at the solicitation of many, it was publicly exhibited in Bowdoin Square, one evening, to a great number of gratified spectators.—This simple trial, it is believed, has established several important principles in relation to burning anthracite, though no one may undertake to warm the city, or even his yard by a suspended grate.

Roxbury, Nov. 17, 1831.

Mr FESSENDEN—I thank you for defending me in a note to the communication of your correspondent of Milford, N. H. against the charge of folly, in supposing, that the proposition that the branches of evergreens, would make a good screen for the hunter, or a good protection for vegetables buried in the earth, was a new discovery. I was not ignorant that evergreens formed one of the best possible protections against cold. I planted 2500 evergreens 25 years since, embosomed my green houses with them, and have formed a milder artificial climate by their use.

But if your correspondent has discovered, that the orange planted in the open ground, can be protected by evergreen boughs stuck thickly round them in the earth, leaving the air to pass freely through them to the exotic plant, he has acquired the knowledge of a fact, for which he will be entitled to the thanks and premiums of all the Horticultural Societies of the Northern States of America, and of the North of Europe. If he did mean, that this is his discovery, he will confer a great favor by stating the mode, and giving instructions as to its application. If he did not mean this, then his remarks had no bearing whatever on my communication, for this is what I did mean to assert as to certain semihardy plants. But as to the orange, mine, under the shelter of a thick grove of pines, one of the thickest I believe in this State, were cut down by a sharp, and unexpected frost in October, even in the mild season of 1830, and are now but just recovering from its effects.

JOHN LOWELL.

N. B. Your correspondent's philosophy is against my experience, and that of most horticulturists here. The dead leaves of forest trees and especially of a sublimar plant, which we call *sauved* or *cl grass* are most admirable protectors against cold, or to use his own philosophical, and sound language, *slow conductors of heat*. Green leaves would be better, for their decomposition would generate heat. We use green leaves for our hot beds occasionally.

Drink for horses.—Some of the Inn keepers on the western road have adopted the practice, recommended by a member of the Bath Agricultural Society, of boiling the corn given to horses, and giving them water to drink. It is most satisfactorily ascertained that three bushels of oats, barley, &c. so prepared, will keep the horses in better condition for working than double the quantity in a crude state.—*English pa.*

Mr FESSENDEN—I observe in your last number a description of the Yellow Oak; Michaux says, if I am not mistaken, that this species of oak does not grow in New England. It is important, if their acorns are to be sent abroad, that there should be some accuracy on the subject. What is called Yellow Oak in this vicinity, is the common Black Oak. I had myself thought of sending you some acorns from a beautiful specimen of the Swamp White Oak; but could not find an acorn of this year. If Michaux is wrong as to the Yellow Oak, (called by him *quercus prinus acuminata*) it should be noticed.

I observe that a neighbor of mine, an old and respectable farmer, has been amusing himself this summer, with contributing to your columns, under the signature of A. R., upon growing sweet potatoes, &c. I cannot accede to his opinions concerning the expediency of repeated crops of rye; though it is a very common opinion in New England.

J. L. ELWIN.

Portsmouth, Nov. 21.

CAPE OF GOOD HOPE.

We are indebted to Capt. VARNY, passenger in the ship *Bengal*, for files of the *Cape of Good Hope Government Gazette* and of the *South African Commercial Advertiser*. The latest date is August 21.

The following advertisement from the Government Gazette exhibits a peculiarity of customs:

'Lady Frances Cole will be happy to receive those Ladies and Gentlemen, who may wish to visit her at Government House, at nine o'clock in the evening on Tuesdays the 12th, 19th, and 26th inst, and the 2d August.

Government House, 4th July, 1831.'

The spirit of the age has reached the Cape. The papers contain accounts of a public meeting held in July, for the purpose of procuring a reform in the government. The result was a petition to the British government that the administration of the internal affairs of the Colony should be committed to a Governor appointed by the Crown; an Executive Council chosen by him; and a Legislative Assembly, composed entirely of Representatives, freely elected by the inhabitants. In the debates, the institutions of America are alluded to as exemplary.—Resolutions were passed, reprobatin in strong terms the abuses of the present system.

Correspondents of the South African Advertiser are engaged in the attack and defence of the principles of Unitarian Christianity.

Public attention had also been successfully drawn to Savings Banks.

The papers contain a favorable notice of the first numbers of 'The Freemantle Observer, Perth Gazette, and Western Australian Journal,' a newspaper published once a week in the little colony of the Swan River.'

Myriads of locusts appeared at some parts of the Cape, about the middle of July. A writer says, 'A cloud of them passed within a few yards of my house, in a train of many millions thick, and about an hour in length.'

The subject of abolishing Negro Slavery is discussed in the newspapers.

The annual examination of the students of the South African College, is favorably noticed. Wool, it is said, must eventually be the staple article of the eastern part of the Colony.

The Caffres had lately committed some outrages in the interior.—*Salem Gazette.*

The estimated population of Canada in 1830, is 698,000.

TO CORRESPONDENTS.—Report of the Massachusetts Horticultural Society will appear in our next.—Several communications unavoidably postponed.

Boston and Lowell Rail Road.

The Company are prepared to contract for making various sections of their Road. Most of the high embankments and deep excavations can be made the winter season.

They will also contract for the building of Bridges and Culverts, some of which will be built entirely of stone, others with stone abutments and wooden bridge.

Proposals will be received for the above work until the fifth day of December next.

A description of the work, and a form of the proposals and contracts, will be given on application to James F. Baldwin, Engineer, or to the subscriber at No. 83 Milk street.

P. T. JACKSON,

Nov. 23. Agent for Boston and Lowell Rail Road.

White Mulberry Trees.

The subscriber has procured a plantation of White Mulberry Trees, of suitable size and age, which he offers at a low rate at his Nursery in Worcester, in lots to suit purchasers.

O. FISKE.

Worcester, Nov. 22, 1831.

Cheapest Magazine in New England.**THE MONTHLY TRAVELLER FOR 1832.**

The publishers, encouraged by the commendation and patronage bestowed upon their past labors, and determined to spare no exertions to merit a continuance of public favor, will continue the enlarged series of the Monthly Traveller, without increasing the price. This series commenced in January last, and each number contains more reading, by one fourth, than the numbers of the first year. While some editors have the modesty to require five dollars a year for a monthly, miscellaneous magazine, it is hoped the very moderate price charged for this work will induce all classes to become patrons, and cause its already wide circulation to be extended still further.

The Monthly Traveller is intended to serve the purpose of those who have not access to the uncounted miscellaneous publications of the day; but who are still desirous of availing themselves of their most valuable contributions. It contains the most popular selections from foreign and American publications; original notices of the current literature of the times, and such articles as are calculated to entertain and instruct readers of both sexes and every age. It is published on the 15th of each month, by BADGER & PORTER, No. 63, Court Street, Boston, at two dollars per annum, in advance, or two dollars and a half at the end of the year.

* Persons intending to subscribe for the volume commencing with the year 1832, are requested to send in their names as early as possible, that the publishers may estimate the extent of their edition.

Nov. 23.

Paris and its Historical Scenes.

Just published by LILLY & WAIT, and CARTER & HENDEE, The Library of Entertaining Knowledge, 2d Part of Vol. 10—Paris and its Historical Scenes.

CONTENTS.—History and Gradual Increase of Paris—General View of Paris—The Tuilleries—Revolution of 1789—History of the Tuilleries during the Revolution of 1789—The Louvre—Massacre of St Bartholomew—Place Louis XV.—Sieges of Paris—The National Guard.

Nov. 23.

Seeds for Country Dealers.

Traders in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed they can be furnished at the New England Farmer's office, No. 50½ North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as may be procured in this country, neatly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and SWEET CORN, &c. of different sorts.

ET The seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves.

Nov. 12.

Flooring Boards, &c.

Of hard Southern Pine, or Eastern White Pine, furnished to order, readily planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had.

Apply to E. COPELAND, Jr, 65, Broad street.

Grape Vine Plants.

For sale at the garden of S. G. Perkins, in Brookline, on the most favorable terms. The plants may be seen and purchased at the Garden at any time; or orders may be left with Mr Perkins at his office, corner of State and Congress streets.

The vines are from one to four years old, in fine order, with wood enough of this year's growth attached to most of the plants to make a dozen or more vines.

Chasselas, common white, or Muscadine.

Chasselas de Fontainebleau, or *Thomery*.

Chasselas d'Or, Bar Sur Aubie.

Chasselas, red.

Chasselas, Muscat.

Black Hamburg.

Black Cape.

Eperione, black.

Frankendall, do.

St Peter's, do.

Zenlandel, by some called the Black Prince; the bunches produced on this vine are very large.

Isabella.

Muscat of Alexandria.

Muscat, red.

Muscat, Grizzly.

Muscat, white frontence.

Muscat, purple.

Constantia—the sweetest of all Grapes, and a great bearer; the berries contain but one seed generally, and sometimes none at all. SAMUEL G. PERKINS.

Grape Vines.

For sale by the Subscriber, at his Garden in Dorchester, several varieties of Grape Vines, Scotch Gooseberries, Althias, and Forest Trees. Among the former are

Black Hamburg,

Oval Purple,

Round Black,

White Muscadine,

White Chasselas,

Constantia.

Black and white Muscatel—one year old. The parent vines are represented to have borne clusters weighing 26 lbs.

Barcelona, a beautiful fruit, one year old.

Polonino,

Mantua Castal-

lana,

" De Peta.

Clarence, or No. 13, a valuable variety, and great bearer.

Isabella,

Catawba,

Blau,

With many other sorts.

Orders for any quantity of the above will be promptly executed, on application by mail, or otherwise, at the Garden, or at 7½ Congress street.

Oct. 5. 5t ZEBEDEE COOK, Jr.

Fruit Trees.

Peach—Pear—Apple and Cherry Trees, very thrifty, and in fine order for setting, for sale at Wm. Buckminster's Nursery, in Framingham. Nov. 9.

Wanted,

Vol. 3 of the New England Farmer, bound or unbound, for which a fair price will be paid. Apply at this office.

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c., which he will dispose of at as low a rate as can be purchased in the city. ET Watches repaired and warranted.

European Leeches,

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention.

E. BENEZER WIGHT,
46, Milk street, opposite Federal-st., Apothecary.
August 5. eopt

Buckthorns.

Gentlemen in want of this valuable plant for live fences can have young quicks about 3½ feet high, for \$3 per hundred, and plants 2½ feet high, for \$2.50 per hundred, by leaving their orders at the office of the New England Farmer. They are raised in the vicinity of Boston, are in the very finest order, and will be well packed. A small charge will be added for freight.

BRIGHTON MARKET—Monday, Nov. 21.

[Reported for the Chronicle and Patriot.]

At market this day 2554 Beef Cattle, 1154 Stores, 4893 Sheep, and 1295 Swine,—1250 Swine have been before reported.

PRICES.—Beef Cattle—More Cattle were suitable for 'Market Beef' than is usual, and last week's prices were hardly supported for such Cattle. We shall quote for extra \$5, prime, 4 50 a 4 83, good, 4 a 4 50, thin 3 a 4.

Barrelling Cattle—Probably no variation from last week; our quotations will stand a little higher; they should have been a little higher last week; we quote for Mess \$3 81 a 4, No. 1, 3 33 a 3 50, No. 2, 2 75 a 3.

Stores—Scales quick; two year old, \$10 a 15. Yearling \$6 a 9.

Working Oxen—A large number at market, but high prices are asked, we noticed sales at \$55, 68, 69, 71½, 75, 78 and 81.

Cows and Calves—Scarce, good Cows in particular are in demand, sales were effected at \$17, 19, 20, 22 and 24. Sheep—Dull and a large number un-sold, we noticed lots taken at \$1 58, 1 62, 1 75, 2, 2 15 and 2 50.

Wethers—No sales noticed.

Swine—Market full, we noticed one entire lot taken to close at 3½c. Also, one lot at 3½c. Two selected lots at 4½c, at retail, 4c. for Sows and 3c. for Barrows.

New York Cattle Market, Nov. 19.—Beef Cattle, market well supplied, a new stock of 1200 head being in—no variation in prices, the best selling at \$7, inferior from 4 50 a 6. Sheep and lambs from 2500 to 3000 in, prices rather better and varying from \$2 50 to 5, and a number of fine wethers sold at 6; lambs from 1 75 to 3. Dressed Pork, rather a short supply—this week sales have been made of lots at 54 a 54½. Cows and Calves—at \$25 to 35.

MISCELLANY.

The following extracts are from a small pamphlet lately published by Lilly & Watt, and Carter & Hender, entitled
KNOWLEDGE FOR THE PEOPLE,
OR, THE PLAIN

WHY AND BECAUSE.

Why are frost-bitten potatoes sweet?

Because of the spontaneous conversion of the starch they contain into sugar.

Why are potatoes unfit for cooking when they begin to sprout?

Because their fecula or starch then becomes sweet.

Why are mealy potatoes more nutritious than those which are watery?

Because of the greater quantity of starch which they contain. Thus, a microscope shows a potato to be almost entirely composed of cells, which are sometimes filled, and sometimes contain clusters of beautiful little oval grains. Now, these little grains remain unchanged in cold water, but when it is heated to about the degree that melts wax, they dissolve in it, and the whole becomes a jelly, and occupies a larger space than it did in the form of grains. When a potato is boiled, then each of the cells becomes full of jelly, and if there be not a great quantity of starch in the cells, it will not burst. But if the number of grains or their size be very great, the potato is broken on all sides by the expansion of the little masses of jelly, and meanness is produced.

Why do many persons become sleepy after eating lettuce?

Because it contains a milky juice, which, like opium, is a narcotic.

Why should water-cresses be carefully picked in washing?

Because a dangerous plant grows mixed with them in springs and streams, which, when not in flower, much resembles the cresses. Water-cresses are, however, of a deeper green, and sometimes spotted with brown, the extremities of the leaves are more brown, and especially the last leaves, which are undulated at their edges. The dangerous plant (water-parsnip) is of a uniform green, the ends of its leaves are longer and narrower, conical at the extremities, and toothed at the edges. If examined in July, when the flowers are expanded, the two plants may be thoroughly distinguished.

Why do wholesome mushrooms differ from other fungi?

Because, when a fungus is pleasant in flavor, it is wholesome; if, on the contrary, it have no offensive smell, a bitter, astringent, or styptic taste, or is even of unpleasant flavor, it is unfit for food. Color, figure, and texture cannot be relied on: yet the pure yellow, gold color, bluish pale, dark or lustre brown, wine red, or the violet, belong to many that are eatable; while the pale or sulphur yellow, bright or blood red, and the greenish, are generally poisonous. The safe kinds have mostly a compact, brittle texture; the flesh is white; they grow more readily in open places than in damp or wood-shaded spots. In general, those may be suspected which grow in caverns, on animal matter putrifying, as well as those whose flesh is watery.—Brande.

Why do seeds grow in sand, or on moistened flannel?

Because of the air, warmth, and water which they receive, the use of soil being quite secondary

to the growth of seeds generally; although the soil at length becomes the proper means, by which alone the plant can arrive at perfection.

Why should not flowers in water, and living plants in pots, be kept in bedrooms?

Because the flowers and plants greatly injure the purity of the air during the night, by giving out large quantities of carbonic acid, similar to that which is separated from the lungs by breathing, which is highly noxious. There are instances of persons who have incautiously gone to sleep in a close room in which there has been a large growing plant, having been found dead in the morning, as effectually suffocated as if there had been a charcoal stove in the room.

Why should rice be kept in large piles or quantities?

Because the heat will not then allow insects to live in the inside of the heap; consequently, the great wastage takes place at the outside surface. Keeping rice, therefore, for any length of time, either in small piles or in bags, is ruinous.

Why should old pearl and Scotch barley be washed before used?

Because by long keeping it becomes mealy on the surface, and the meal is generally musty and sour.

Why is barley freed from its bran for domestic purposes?

Because the bran contains a resin of a purgative, and even acrimonious nature. Thus, Scotch, French, or pearl barley, is merely common barley, kilndried, and deprived of its husks or bran by a mill; the grains are then rounded, and cut down smaller, and lastly, whitened in their own meal.

Why is lemon-juice altered by keeping?

Because the mucilaginous matter which it contains is very soon altered by spontaneous decomposition.

Why are capers wholesome?

Because they are stimulating, antiscorbutic, and aperient. The bark of the root of the common caper passes for a diuretic medicine.

Why are eggs used for clarifying syrup?

Because the albumen, or white of the egg, being coagulated in boiling, combines and rises in a scum with the dregs, when cold. The juice of the fruit of the ochra (*Hibiscus esculentus*) according to Dr Clarke, contains liquid albumen in such quantities, that it is employed in Dominica as a substitute for the white of eggs, in clarifying the juice of the sugar cane.

Why do rich cakes keep good for a long period?

Because in making them, water is not used, which would soon turn sour; and sugar, of which they contain much, will not ferment unless it be dissolved in water.

Why is ginger beer the most refreshing of all summer drinks?

Because it retains its carbonic acid for a length of time in the glass; and ginger has this remarkable property of occasioning a high, close, creamy head upon all effervescing liquors.—Donnan.

Why is a polished metal tea-pot preferable to one of earthenware?

Because the earthen pot retains the heat only one eighth of the time that a silver or polished metal pot will; consequently, there will be a corresponding difference in their fitness for extracting the virtues of the tea.

The receipts on the Liverpool and Manchester railroad from January to June were about 300,000 dollars.

FRUIT TREES.

For sale at the KENRICK NURSERY, in NEWTON, near Boston, a most extensive assortment of Apples, Pears, Peaches, Plums, Cherries, Apricots, Nectarines, Almonds, Mulberries, Quinces, Raspberries, Gooseberry and Currant bushes, Grape Vines of the best foreign sorts, and 25 finest varieties of Strawberries, including the most rare, productive and esteemed.

Also about 40 varieties of the most hardy ornamental trees and shrubs, and superb hardy roses, including Silver Firs, varieties of Spruce, Flowering House Chestnuts, Flowering Catalpas, Mountain Ash with beautiful clusters of red berries in autumn and winter, Purple Acacia, Three Thorned and Thornless Acacia, Futernuts, Albano, Tree of Heaven, Elms, American and Scotch, Sugar Maples, Weeping Willows, &c. do. do. Napoleon from St Helena tree, Honey suckles. Many of the above sorts of trees of extra sizes, for ornamenting highways and commons.

WHITE MULBERRIES, genuine sort for silk worms, by the 100 or 1000 for Plantations.

ABELLA and CATAWBA Grape Vines, either singly or at reduced prices by the 100 or 1000.

CHINA ROSES, CHINESE CHRYSANTHEMUMS, GERANIUMS, &c. &c.

Written orders addressed either to JOHN or WILLIAM KENRICK, NEWTON, are regularly received by the daily mail, and will be promptly attended to, or they may if more convenient be left with J. B. Russell, at the New England Farmer office, where also, catalogues may be obtained gratis on application. But purchasers are invited when convenient to call and examine the trees, &c. for themselves, and make their own selections; but when this is not convenient, then let them forward their orders, relying that the very best possible selection will be made for them. Trees when destined for a distant place, are carefully packed either in clay or moss, and mats, and delivered whenever ordered in Boston free of any charge for transportation. eptd1 Oct. 19.

Amunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned an.

Pear Seedlings.

For sale at the Agricultural Warehouse, No. 52 North Market Street—

PEAR SEEDLINGS, of vigorous growth, and promising appearance, raised within six miles of Boston, in fine order for nurseries—the largest size are from 18 to 24 inches in length, the whole plant; price \$10 per thousand; the second size from 12 to 18 inches in length, price \$5 per thousand. They will be suitably packed as wanted, for transportation to any distance. Oct. 19.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but any person who subscribes six days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

Printed for J. B. RUSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for printing received by J. B. Russell, at the Agricultural Warehouse, No. 52 North Market Street.

GREAT CROP OF CORN.

To the Editor of the N. E. Farmer.

What is the use of emigrating to Oregon when 120 bushels of corn can be raised in Chenango, when wild land equally good with the land bearing this crop can be had in any quantity from three to five dollars per acre?

Having received much useful instruction in pursuing the details of good farming, great crops and scientific horticulture recorded in your valuable paper and having raised a very fine crop of corn this season for this district, viz. 211 baskets, averaging 19½ quarts to the basket, on one acre, and thirteen rods of land, I take the liberty of sending the account of this crop to you, and if worthy of record you are at liberty to publish it.

The entire corn field was surveyed by a sworn surveyor. The lines were run backwards as well as forwards, the surveyor carrying one end of the chain on the back track to correct mistakes if any. The corn was measured in two baskets as picked in the field, one of which was taken from the field by my overseer as picked to his house, dried, shelled and found to contain 20 quarts.

The other basket was filled in the usual way from the ear at the crib, at my house and under my care even full, without packing or shaking to make better stowage. The corn was dried thoroughly in an oven, shelled, and found to measure 19 quarts, and weighing 37 lbs. The difference in measure may be accounted for in the better stowage of the baskets taken from the field the ears thrown in singly as husked in the field, and the basket shook by moving 3 or 4 times.

The crop was raised on what was supposed to be a poor part of a farm of 200 acres adjoining this village, purchased in 1825 for \$10 per acre, and condemned by the former occupier, as well as neighbors as a poor farm, calculated to starve the owner. I am now happy to say that the fine show of Grass, Wheat, Barley, Corn, Mangel Wurtzel, Ruta Baga, &c., has restored its lost credit. The soil of the farm varies from a sandy loam to a stiff clay. The part occupied by the corn is a stiff loam. It was thrown out of a tillage lot into a pasture 20 years ago, being then considered too poor or too stony to till. The stones were carefully dug and picked up to the amount of 50 loads to the acre this spring. Ploughing only once, an extra hand following the plough with a bar and mattock removing every obstruction to the plough. This was the most tedious part of the work employing a span of horses, and two men for two days. But when done the land was completely ploughed. We then drew on 25 cart loads, about 25 bushels to the load, of sheep manure, and spread it evenly on the furrow. Rolled and harrowed with the furrow, with a light double harrow, containing 40 teeth until it was a complete granite mould, and the earth well incorporated with the manure; again picked off the stones and again rolled and planted on the 22d and 23d of May on an even surface, with the early small white flint corn, steeped in a solution of copraes and salt petre and then tarred and rolled in plaster, and planted in double drills 3½ feet from centre to cen-

tre, of the middle drill. The plants standing singly from 12 to 13 inches on the middle drill. The corn was once ploughed, afterwards kept clean with the hoe, plastered well on the plant, topped at the usual time, was ripe on the 15th of September and harvested on the 11th and 15th of October and found to yield at least 130 bushels of shelled corn 60 lbs. to the bushel, or 140 calculating 54 lbs. to the bushel.

I am, sir, most respectfully yours,

BENJAMIN BUTLER.

Orford, Chenango co.)

PRESERVATION OF SWEET POTATO SLIPS.

MR. FESSENDEN—In the 13th number of the present vol. of the New England Farmer is contained a communication on the subject of culture of the sweet potato, to which is annexed the editorial remark that, 'No economical method of preserving the slips for seed through the winter in New England has yet been discovered to our knowledge.' As considerable quantities of this article are kept through that season of the year by many families in this vicinity, with little difficulty when the climate is not essentially, if any, milder than in the southern parts of New England, I have taken the liberty of forwarding to you a description of the methods which have been the most successful.

In attempting their preservation it is necessary to attend to two points. 1st, to secure them from moisture. 2nd, to protect them from frost.

As soon as they are dug they should be exposed to the sun for two or three hours till their skins become dry; they then should be packed in a tight box in layers alternately, with layers of dry sand two inches thick, so that no two of the slips shall touch each other, in which case a decay would commence that might ultimately affect the whole quantity. The finer the sand the better, and it is to be preferred if it contain a small portion of loam, as in coarse washed sand they wither up and soon lose the power of vegetating. Some people pack them in dry wheat chaff, which they prefer to sand, but I have never used it for this purpose, though I have found it to be well calculated for preserving winter apples, having unpacked from it, in the month of May, Rhode Island Greenings, in a sound state, with their flavor undiminished.

Various methods have been tried for protecting the slips from frost. One of my chimneys is supported in the cellar by a brick arch, which is raised seven feet above the foundations and the under surface of which is kept warm by a fire in the kitchen. Underneath it is built a platform sufficiently high to admit a box containing the slips packed as before described, so that the upper strata of sand will nearly touch the under surface of the arch. In this situation a few of the most exposed may wither and become useless, but a large proportion will come out as fresh in the spring, as when placed there in autumn. This I have tested by eight years' experience.

Some people place them in a vacant oven, stock hole or cupboard near the fire, others again in

merchants' counting-rooms or in mechanics' shops, that are kept sufficiently warm, I believe a temperature of from 38 to 40 of Fahrenheit to be the most congenial to them, through the autumn and winter.

The Dutch, whose houses are invariably furnished with a *tea plate* or box-stove, place their boxes of slips, in their stove rooms, and on the approach of spring, occasionally sprinkle the sand with water, which, though it would be fatal to the plants during the cold weather, accelerates the growth of their shoots at this time, when there seems to be a natural disposition in them to put forth; and by the time the ground is in a condition for planting, these provident people are supplied with sprouted shoots without the trouble of a hot bed.

The large roots may be preserved equally well through the winter for cooking.

Their cultivation is the most successful upon a sandy soil well mixed, with manure thoroughly decayed; but that which is rank and recently from the yards should not be used, as it would promote a luxuriant growth of the tops to the injury of the tubers. I have not unfrequently raised them as large as those brought from the more southern states though not equal in flavor. A majority of the families in this vicinity cultivate them in their gardens, and some on a scale so extensive that they become an object of profit. In favorable seasons they will yield at least as abundantly as the common potatoes.

The red and yellow varieties are the richest flavored and form the best shaped roots, though they do not grow as large as the white.

Respectfully yours,

J. P. KIRTLAND.

Poland, Ohio, Nov. 15, 1831.

FOR THE NEW ENGLAND FARMER

TREES.

He that plants a tree thereby becomes a benefactor to his country.

If this statement be true there is a large portion of our community who are so circumstanced that they might without detriment to themselves devote more of their attention to this subject than they have hitherto done. It is one which deeply interests all those who look forward to the future well-being of our country. Our forests are rapidly vanishing before the hand of the husbandman and our land will soon become comparatively bare of them unless there is a counteracting influence exerted by the cultivator in planting *once* those trees which will be the most serviceable to man. There are at this time thousands of acres of unproductive grounds, which might in a few years be converted into excellent pasturing by planting the same at suitable distances, with trees of various sorts, that they might serve as a protection from the scorching rays of the sun, and preserve a more uniform state of moisture, so that vegetation should not become checked by blight.

Why is it that our road sides are not lined with trees either for ornament or use, as they are in other countries? Is it because we as a people are devoid of taste? Certainly not. Let the utility, and feasibility, of these plans be laid before the public

in a proper light, and they will be acted upon. There is nothing that adds more to the beauty of a landscape, than to see interspersed over hill and dale, trees in full foliage, standing singly or in clumps; they afford a resting place for the eye of the weary traveller, and at every turn new beauties are unfolded.

Where is the man, who when sitting surrounded by his friends under the wide spread canopy of a tree of his own rearing, partaking of the bounties of our mother earth, that would not *exult* while informing them that this was a tree of his *own right hand's planting*. And that we may be enabled so to do, let us now, in the proper season for such labor, put our lands to the work, with the determination, (Providence permitting) that we will sit under our own vine and fig tree, and enjoy the fruit of our toil.

PIONEER.

Windsor, N. H. Nov. 24, 1831.

FARMS IN VERMONT.

MR FESSENDEN—As five of my townsmen, Farmers, design to start for the Boston Market next week, with a portion of the productions of their farms, and as no statement as to the value of houses and house lots, value of improved land, quantity of agricultural production, &c, has heretofore been noticed in your paper from this section of the country, I forward for publication a statement belonging to the individuals as named below. The value of houses and house lots and improved land, I have stated as ap raised by the list of this town in 1830.

Wood and timber land belonging to each farm is not included in the estimate. WM. BACON has three houses and house lots valued at \$775, and has forty-five acres of mowing, twenty-two acres of tillage land, and forty-five acres of pasture valued at \$924; this stock consists of four oxen, seventeen cows, 20 other cattle, 12 horses and mares, 62 sheep, 10 fat hogs, 7 running shoats; has cut this season 65 tons of hay, harvested 90 bushels of wheat, 275 bushels of oats, 175 bushels of corn, 12 bushels of beans, 900 bushels potatoes, and has for market 2500 lbs. of pork, and 1950 pounds of butter. His family consists of eight persons, besides one hired man seven months, and some days' work; whole expense for hired men's labor \$110.

CLOUD HARVEY. His house is of that construction that it is not entered in the list; has 30 acres of mowing, 15 of tillage, and 30 for pasturing valued at \$372, 2 oxen, 14 cows, 7 horses and mares, 28 sheep, 6 fat hogs, 8 running shoats, has cut 35 tons of hay, harvested 150 bushels of wheat, 300 bushels of oats, 80 bushels of corn, two bushels of beans, 500 bushels of potatoes, and has for market 1500 pounds of pork, 1300 pounds of butter. His family consists of eight persons, besides one hired man eight months, and some days' work; whole expense of hired labor \$90.

MOSES BOUCE. House and house lot valued at \$675; 14 acres of mowing, 734 of tillage, 29 acres of pasture valued at \$233, 7 cows, 5 other cattle, 6 horses and mares, 24 sheep, 4 fat hogs, 4 fat shoats, 4 running shoats; has cut 21 tons of hay, and has harvested 60 bushels of wheat, 75 bushels of oats, 50 bushels of corn, 5 bushels of beans, 523 bushels potatoes, 12 bushels turnips, 50 pounds of flax, and has for market 1600 pounds of pork, and 600 lbs. of butter. His family consists of six; whole expense of hired men's labor \$20.

WILLIAM SHEARER. House and house lot \$200; 26 acres of mowing, 13 of tillage, 49 for pasture valued at \$400, 6 oxen, 7 cows, 18 other cattle, 6 horses and mares, 38 sheep, 4 fat hogs, 6 fat shoats, 4 running shoats; cut 35 tons of hay, harvested 35 bushels of wheat, 300 bushels of oats, 80 bushels of corn, 6 bushels of barley, 2 bushels of beans, 400 bushels potatoes, he has for market 1600 pounds of pork and 350 pounds of butter. His family consists of 12, besides 10 months' labor, whole expense of hired men's labor \$85.

WM. WARDER, JR. House and house lot \$150, 26 acres of mowing, 150 of tillage, 20 of pasture, valued at \$264; his stock consists of 2 oxen, 6 cows, 12 other cattle, 4 horses, 18 sheep, 5 fat hogs, 4 fat shoats, 5 running shoats, and has for market 1700 pounds of pork, and 500 pounds of butter. His family consists of five, besides five months' men's labor at \$50.

It would be a great satisfaction to your subscribers in this quarter to have such farmers in your vicinity as offer butter or farms for premiums to state the value of their owned house lots and the quantity and value of improved land as appraised by the assessors of the several towns to which they belong. As soon as our farmers have been to market this fall and winter I design to make out a statement of the various articles of exports from this town and the amount as received in market, and to what market the same is exported.

I recommend your farmers to compare the value of their improved land and the amount of production with the Barret farmers. And when they move, move not to the West, but to where the climate is good and healthy, land cheap and productive.

Yours with respect,

HENRY STEVENS.

Barnet, (N. H.) November 17, 1831.

N. B. The individual farmers named above design to enter their several lots of butter for the premium; you will please give our secretary notice.

The foregoing notices are valuable and we should be happy to receive similar statements relative to farmers, their property, products, &c, in Massachusetts and other parts of N. England. We would be pleased to make such observations and inquiries in person as would enable us to give the desired information, but indispensable avocations deprive us of the leisure necessary for that purpose.—*Editor.*

PLANTING FRUIT SEEDS.

MR FESSENDEN—In answer to the inquiries of your correspondent M. as to the best mode of planting fruit seeds and stones, I would observe that I have found the present month (November) the most suitable for that purpose. I put Peach, Apricot, Plum, and Cherry stones, and Pear and Quince seeds into the ground two to three inches below the surface, cover them with earth, and then lay over them a course of well rotted manure. I have always succeeded in producing an abundant crop, except in one instance of planting of Peach stones and another of Pear seeds; the non-success of the former I imputed to the dryness of the soil, and that of the latter to the destruction of the seed in the pomace, it having remained in barrels several days, and probably underwent some fermentation. I should advise the planting of fruit stones and seeds in a moist but not a wet soil.

DORCHESTER.

FOR THE NEW ENGLAND FARMER.

FARMERS' FESTIVALS.

Extract from a communication on the subject of the Farmers' recent Shows and Festivals.

The founders and patrons of these popular societies, "aristocrats" if you please have introduced the only practical system of equality which the condition of the civilized world can admit. The duties incumbent on the "Farmer's Holidays," with their attendant courtesies and festivities, assimilate and merge all who partake of their enjoyments, into one community of brethren. In these associations they cherish and exhibit that manly and independent deportment, becoming the lords of the soil. Let every order elevate itself to the standard of the intelligent and useful citizen with the spirit which should actuate them, and they are met with that fraternal cordiality which feels no degradation.

The levelling system of a republic must consist in elevating all ranks and depressing none. That malignant class, devoid of self respect, whose consequence in society is acquired and sustained by traducing merit instead of emulating it, are alone of the *privileged order*. This despotism is waging an interminable war against our most patriotic citizens, who possess, the only aristocracy they covet, THE PRIDE OF CHARACTER.

CATTLE.

We are happy to find that more attention than formerly has been recently paid to the raising of stock. The sale of the celebrated cattle of JAMES HARE POWELL, of Philadelphia, enabled many farmers of means and enterprise to possess themselves of some valuable animals. A good proportion of this valuable stock is now in the possession of CHARLES A. BARNETT, Esq. of Spring Dale farm, near York, Pennsylvania. The following description of one or two of the cows, which we copy from Poulson's Advertiser, will be found interesting to many of our readers. We are inclined to class farmers who give their attention to the improvement of stock, among the most, if not the most, useful of our citizens.—*Nat Jour.*

To see these cattle alone is worth a visit to his residence. There are about twenty or thirty head of the full blood, besides nearly as many of common and mixed blood. Among the former is the celebrated Bellina, the famous butter cow. In her appearance she is far below many of her companions, though when critically examined, her points are all good. The straight back,—the perfect level of the spinal column from the horns to the tail,—the square sides, the wide hips, the full brisket, the intelligent countenance and wide-spreading bag, are all there; but she makes a pound of butter at every milking, and hence she has not the sleek fat sides, and the *filling up* so necessary to a finished and beautiful subject. She illustrates the idea perfectly, which we have so often inculcated, that a deep milker or a great butter yielder cannot be easily kept fat. She illustrates another position we have advanced, that milk from different cows, apparently of equal richness, is very differently constituted. In some, cheesy matter and whey prevail, in others cheesy matter and oil, and in others oil and whey prevail with but a slight quantity of cheesy matter. The first is common milk, affording a small quantity of cream, and poor skim milk; the second affords a medium quantity of cream, and makes good cheese, and good skim milk; the last affords a very large

quantity of cream, no cheese; scarcely, and very poor skim milk—so poor indeed that it is scarcely fit for use. This latter is the case with Bellina; when her milk has stood the proper length of time, the cream, the milk being three or four inches deep, is nearly half an inch thick, and so firm that it will almost bear lifting like a buckwheat cake, the skim milk being very inferior. Mrs. Barziz took about half a pint of her cream in a bowl, and in a few minutes produced six ounces of the finest butter we ever tasted, by simply stirring it with a teaspoon. The buttermilk produced was less than a small wine glass full, and that of quite a poor quality. This cow, unlike the generality of her breed, has coarse hair, and is of ordinary size, and, as before remarked, would be taken for an ordinary animal, except upon critical examination by a good judge. Very high offers have been made for her and her calves.

Another cow presented a remarkable character; she was the largest we ever saw, measuring between the points of her hips about two feet four inches.—We could not take the measurement exactly, as she was rather shy of our stick, but we satisfied ourselves that we were not an inch out of the way, and think we are within the truth. She is of good proportion in all her parts. She has not had a calf since she was imported, in consequence as it is supposed of some injury on the voyage. The proprietor expects to fatten this cow for the Baltimore market, and if he does, we shall be able to boast of a beef superior in weight and quality to any ever slaughtered in America.

There are many beautiful young bulls and heifers for sale. We noticed a pair of calves as white as swans, of equal size and age, that attract great attention, and induce high offers. We must not pass over the fine young animal selected by Mr. B. for his stock bull. He is beyond all comparison the finest animal of the kind we ever saw, and has the fine points of his breed in the greatest perfection imaginable.—When we have heard that if the legs were cut off upon a line with the bottom of the belly, and the neck perpendicularly with the breast, the body would form a perfect oblong square, the sides of which would be just double the width of the ends, we have been in the habit of considering it a fancy sketch; but actual measurement and examination of this bull convinces us of its truth.

From the Juvenile Miscellany.

ANECDOTES OF DOGS.

The valleys, or *glens*, as they are called in Scotland, which intersect the Grampian Mountains, are chiefly inhabited by shepherds. The pastures, over which each flock is permitted to range, extend many miles in every direction. The shepherd never has a view of his whole flock at once, except when it is collected for the purpose of shearing. His occupation is to make daily visits to the different extremities of his pastures in succession; and to turn back, by means of his dog, any stragglers that may be approaching the boundaries of his neighbors. In one of these excursions, a Highland shepherd carried with him a little child about three years old. This is a common practice among the shepherds, who do it in order to accustom their children to the rigors of the climate and the hardships of their situation. After traversing his pastures for some time, attended by his dog, the shepherd found himself under the necessity of ascending a summit at some distance. As the ascent was too tiresome for the child, he left him on a small plain at the bottom, with strict orders not

to stir from it till his return. Scarcely, however, had he gained the summit, when the horizon was suddenly darkened by one of those thick mists, which descend so rapidly amid the Grampians, as almost to turn day into night in the course of a few minutes. The anxious father immediately hastened back to his child; but owing to the darkness, and his own fears, he lost his way. After wandering about a long time, he discovered in the light of the moon that he was within a short distance of his cottage. It would have been both useless and dangerous to have renewed his search that night. He therefore returned home, bitterly mourning over the loss of his beloved child, and the shepherd dog, which had served him faithfully for many years. As soon as the day dawned, he set out with a band of his neighbors, to seek for the lost little one. All day they labored in vain, and at night returned home disconsolate. They found that the dog had been to the cottage during the day, and after receiving a piece of cake, had immediately disappeared. For three successive days the shepherd renewed his search, and every night when he returned he found his dog had been at the cottage, and carried off bread, or cake. Knowing the sagacity of the animal, he resolved to wait and follow him. He did so—and after scrambling his way down frightful precipices, he saw his dog enter a cavern, the mouth of which was almost on a level with a stupenuous mountain waterfall. He entered, and beheld his infant eating the cake, which the faithful animal had procured, while he stood by, with the utmost satisfaction, and watched until it was devoured. The little boy, being left alone in the dark, had probably fallen, or scrambled down the precipice, and had been afraid to leave the cave on account of the foaming waterfall, which dashed down from its mouth. The dog never left the child except to procure him food, and then he was always seen running at full speed.

Miss Wakefield tells of a pretty little spaniel belonging to one of her friends, which was uncommonly intelligent. He was accustomed to indulge himself on the lawn behind the house. One morning, he found a heavy dew had made the grass very wet, not liking such a damp couch, he stopped a moment to think what he should do. After a moment's reflection, he trudged into the house and brought out a mat in his mouth, upon which he quietly lay down and went to sleep.

Soon after the British and Indians under General St. Leger, raised the siege of Fort Schuyler, Capt. Grigor, of the New York line, obtained permission to hunt, accompanied by a brother officer. On their return, they were suddenly fired upon by an ambush of Indians, who knocked them down with tomahawks, and scalped them, as their manner is, from the forehead to the back of the neck, leaving only a couple of small locks of hair by the side of the ears. Capt. Grigor had the resolution to be perfectly still during this horrible operation; though he afterward said he felt as if hot lead were poured over him. The Indians, supposing he was dead, left him. Not long after, he felt his burning head touched very gently and tenderly and he immediately conjectured it was his favorite dog, which had followed him to the chase. 'Never shall I forget,' said he, 'how soothing the cooling tongue of the faithful creature felt at that dreadful moment!' On attempting to rise, Capt. Grigor found his back bone severely wounded, and his forehead bruised by the stroke of the tomahawk. Alone, and mangled as he was, he had no hope of life. He crawled along to his dead companion, and opening his vest he laid his throbbing head upon the soft bosom, not yet cold in death; for the stones and sticks among which he had lain were torture to him.

But he was not alone at this trying moment—his faithful spaniel was his friend! The officers at Fort Schuyler had long been anxious about their companions, and were on the watch for them, when Tray was seen issuing from the wood, panting with eagerness and fatigue. 'They are coming!' was the universal exclamation, 'for there is the dog.' They soon, however, discovered that the dog was alone.

He came to them, and by clenching, whining, running to and fro, and looking up in the most supplicating manner, he plainly told that some evil had befallen his beloved master. A detachment was immediately sent out, with orders to follow the dog. The anxious animal eagerly guided them to the spot where the dying reposed upon the dead. Under the care of a skillful surgeon, Capt. Grigor entirely recovered.

The late General Dearborn told me he heard the story from Capt. Grigor himself; the dog in the meanwhile sat gravely by his side, and looking up sorrowfully, at all perfectly conscious that his master was describing his sufferings. 'I suppose,' said General Dearborn, 'that nothing would induce you to part with Tray?' 'No, sir,' replied Capt. Grigor; 'I must part with my life first. He shall never want a friend till my bones are in the dust.' The dog wagged his tail, put his paw upon his master's foot and nestled close to his side.

In ancient times, a French gentleman of family and fortune, when travelling alone through a forest, was murdered, and buried under a tree. His dog an English blood-hound, went to the house of his master's friend in Paris, and by howling, looking toward the door, and pulling at his coat, made him understand that he wished to be followed. This dumb eloquence having effected its purpose, he led the way directly to the tree, where he scratched the earth, and howled. On digging the spot, the body of the murdered man was found.

A long time after this, the dog met the assassin in the midst of a crowd, and instantly flew at his throat. Whenever he saw the same individual, he always attacked him with the same ferocity. This excited suspicion; and the king, Louis the Eighth, having himself been a witness of the fact, determined to refer the decision to the chance of battle. In those days they did not have trials by judge and jury, but decided causes by single combat; those who were vanquished, were deemed guilty. The battle between the Cleverest and the blood-hound took place in the Isle of Notre Dame. The dog brought the man to the ground. He confessed the murder, and was beheaded. A monument in *basso-relievo*, representing the combat, still remains in the grand hall at the Castle of Montar in France.

It is recorded of a dog, belonging to a nobleman of the Medici family, that he always attended at his master's table, changed the plates for him, and carried him his wine in a glass placed on a salver, without spilling a drop. This is surely a most astonishing instance of canine sagacity; but those attainments were perhaps outvalued by the dog who was taught to speak. The dog alluded to, is mentioned by the French academicians; he lived in Germany, and could call, in an intelligible manner, for tea, coffee, chocolate, &c. The account is given by the celebrated Leibnitz, and was briefly this: 'The dog was of a middling size, and was the property of a peasant in Saxony. A little boy, the peasant's son, imagined that he perceived in the dog's voice an indistinct resemblance to certain words, and was therefore determined to teach him to speak distinctly. For this purpose he spared no time or pains with his pupil, who was about three years old, when his learned education commenced and at length he made such a progress in language, as to be able to articulate no less than thirty words. It appears, however, that he was somewhat of a truant, and did not very willingly exert his talents, being rather pressed into the service of literature; and it was necessary that the words should be first pronounced to him each time before he spoke.'

Roasted Ham.—The chief dish was a roasted ham, which I had never before seen, but which they have to recommend to all who are not above the enjoyment of dining well. This is not an unusual dish in Spain when it is intended to treat a guest well.—*Ingle's Spain.*

Horticultural.

Proceedings of the Executive Committee of the Mass. Hort. Society, at a meeting held at the Hall of the Institution, on Saturday, the 19th of November, 1831.

The following report was made by the President, H. A. S. Dearborn.

Since the last meeting the following letter from J. R. Van Zandt, Esq. of Albany, has been received.

Albany, Oct. 31, 1831.

H. A. S. DEARBORN, ESQ.

DEAR SIR—I have shipped by the Schooner Grecian for Boston and to the care of the agent of your society, Mr J. B. Russell, a box of seeds &c, of the choicest kind we could collect in our neighborhood, and have also sent by Mr Tucker of Boston, 5 ears of the large early White Corn, raised by Mr Thomas Hillhouse, of this county, and is highly esteemed by us.

I have also sent a few Black potatoes of a new kind among us; they are an excellent Potato to keep.

Should you find any of the articles sent worthy of a trial in your new Garden of Experiment I shall be much gratified.

Permit me, sir, at this time, to express to you and to the Society the high sense and estimation with which I hold the honor conferred on me, by being constituted an honorary member of the Massachusetts Horticultural Society.

Accept my best wishes for your health and happiness, and for the prosperity and duration of the Society.

I remain, dear sir,

Most respectfully yours,

J. R. VAN ZANDT.

The subjoined extract of a letter from Col. Thomas H. Perkins, I obtained permission to lay before the Society, although it was not written with any other view, than to do me a kindness. Having some years since built a Vinery three hundred feet in length, where he has most successfully cultivated a great variety of grapes, as well as peaches and acetaries, he has during the past summer erected another edifice two hundred and ninety-six feet long, combining vineries, peacheries and a green house, on the most approved plan, and as it is highly important that such extensive experiments should be generally known, that others who may be induced to imitate the example, might avail of the information which Col. Perkins has acquired, I believed that all persons interested in horticultural pursuits would be pleased to read the extract, which I have been allowed to make.

Col. Perkins has made great successful efforts to advance the culture of choice fruits, as well as to encourage a taste for ornamental gardening, as is well known by those who have visited his beautiful grounds. From his extended commercial intercourse with all parts of the world, he has been enabled to collect numerous rare and valuable trees, and plants; and with that liberality, for which he is distinguished, he has freely distributed them throughout the country. Such munificent patrons of useful and ornamental planting, not only accelerate the progress of horticulture, in their immediate vicinity, but the influence of their practical operations is extended over the Republic, and will be gratefully remembered by their fellow citizens.

Extract of a letter from Col. Thomas H. Perkins.

Boston, Wednesday Eve.

MY DEAR SIR—I shall call on you in the morning to take you to Brookline, and save you the trouble of making memorandums in relation to the mode of heating hot houses by hot, not boiling water which would raise steam. The water is not heated above 190 degrees. I gave you the principles upon which the present mode of heating is based.—At one end of a house of 56 feet, intended as a house for exotic plants, I have a boiler of about 80 gallons; into the upper part of this boiler is introduced a pipe of cast iron of 4½ inch bore; this pipe is introduced at the angle of the house into an elbow, from whence it is taken by two pipes of same dimensions into a reservoir at the end of the house of the same size of the boiler. The reservoir is of thick Russia Iron, with a cover: the pipes run horizontally from within 3 inches of the top of the boiler to the same level in the reservoir. At the lowest point of the reservoir the water is returned through a third pipe from the receiver to the boiler on the same level. The expansion of the water by heat, drives the water from the boiler through the upper set of pipes into the reservoir, and from thence it is taken by the lower set of pipes again to the boiler, where it is heated and is thus perpetually circulated, giving off an equable heat competent to all the warmth required. The advantage of this mode of heating over flues or steam apparatus is great; in flues the fires must be carefully kept up through frosty nights, or your plants are in danger; with steam, though the heat is soon up, yet when the water is below the boiling point the heat is soon lost. With hot water not above 190 deg. of Fahr. left by the gardener at 8 o'clock in the evening, heated by Anthracite Coal and with the dampers nearly closed, the state of the house if ordinarily tight, will be found in the morning within a very few degrees of the state in which it was left twelve hours before.—This mode of heating houses was suggested and put in practice first by Atkinson, from whom I had my watering plans and directions. It is said they have been improved upon by Tredgold. I have seen Atkinson's plan most successfully operated upon by gentlemen both on the continent and in G. Britain—there may be improvements; I know of none which I think such. It is thought one fire will heat the length of a house of 75 feet of moderate height. The house I have heated is 56 feet and the length of pipes 150 feet, being two upper and one lower pipe, and my pipe returns double on the ends of twenty feet, working the whole length 190. The whole extent of my house is a few feet short of 300—the centre 20 feet wide and the back wall 20 feet high, is intended for a green house; the water from the whole extent of glass is collected in a cistern, which contain 70 hogheads of water, say 7000 gallons—a copper pump raises the water in a cistern, from whence it is distributed, by the medium of leaden pipes, with occasional offset pipes at every part of the entire house. About 120 feet at each end of the green house composes a grape house, or rather two grape houses of 60 feet each and peach houses divided in the same manner, making 240 feet, which is 15 feet wide within the walls; the back wall 17 feet high, except in the rear of the green house where it is 20 feet, the front wall is about 3 feet above ground exclusive of three feet of glazed sashes and stands on brick piers 3½ feet apart to give the roots fair range.—In that portion of the house intended for grapes, I displaced the old soil 4½ feet deep and thirty feet wide, that

is 15 feet within, the same width without the house, and filled the space with old stable and slaughter house manure with an equal quantity of virgin soil and sods—this has been trenched the whole width three times to the extreme depth.

The other end of the house I treated in the same manner, except that in place of rich manure, I put merely good soil though not rich—this was done to the same width as the other end of the house. The centre house is filled with stone except the place occupied by the pipes and the cistern and a border for creeping plants. I used 201 thousand bricks in the walls—between 26 and 27 thousand squares of 6 inch Crown glass—the sashes weigh about 2400 lbs.; the glass is lapped only one eighth of an inch, and without putty between.

Your friend and servant,

T. H. PERKINS.

It being desirable to extend our correspondence over every portion of the globe, I have endeavored to ascertain who were the most conspicuous for their devotion to the cultivation of the soil in the various countries, with which we have a direct intercourse, and through the mediation of a friend have been made acquainted with the character of Don Francisco Aguilar of Maldonado, in the Banda Oriental, South America. He is distinguished for his attention to the cultivation of all the varieties of fruit trees, and economical plants, which will flourish in that delightful climate. He has recently sent orders for many of our fruit trees, cereal grains and seeds of esculent vegetables, and has forwarded grape vines, and numerous kind of seeds, of that region, to several gentlemen of this Commonwealth, who state that he is desirous of opening a correspondence, and to interchange the vegetable productions of the two Americas.

Being extensively engaged in agricultural and horticultural pursuits and largely concerned in the commerce between this country and the territories bordering on the Rio de la Plata and Paraguay, and holding the office of Consul of the United States, it would be highly beneficial to the Society, to avail of his services, and it is recommended that he be elected a corresponding member.

The following books have been recently received from our attentive and most valuable agent and fellow member, Col. Thomas Aspinwall, Consul of the U. S. in London.

1st. A guide to the orchard and Kitchen Garden, by George Lindley, C. M. H. S. Svo. price 12 shil. ster.

This work was published last July. The author was occupied during nearly forty years, in preparing the materials for the press, and was aided in the editorial department by John Lindley, Esq. Assistant Secretary of the Horticultural Society of London. It contains a complete account of the fruit trees and vegetables cultivated in Great Britain, and in a form so condensed as to comprehend the greatest quantity of information in the smallest compass, and which at the same time is sufficiently diffuse to render it possible for the reader to acquire as much knowledge as is either important, or indispensable, in regard to any particular variety. Those points, which are so peculiarly interesting to the practical operations of gardening, have been in all cases treated with especial care; such as the kind of soil upon which a given variety of fruit will best succeed. The comparative value of each kind,—the aspect that it requires,—the different names under which it is

known in England, or elsewhere,—the book in which a faithful figure may be found,—the purposes for which it is adapted,—the seasons when in the greatest perfection,—and the mode of propagating, pruning and training.

There are exact descriptions of the following fruits.

Almonds,	3 varieties.
Apples,	214 “
Apricots	14 “
Cherries,	28 “
Currents,	6 “
Figs,	27 “
Gooseberries,	24 “ with a catalogue of 722 kinds.
Grapes,	62 varieties.
Melons,	24 “
Peaches,	60 “
Nectarines,	28 “
Nuts,	8 “
Pears,	162 “
Pine-apples,	37 “
Plums	60 “
Quinces,	3 “
Raspberries,	22 “
Strawberries,	62 “

Total, 724 varieties.

The best varieties of esculent vegetables for the Kitchen Garden are enumerated and the most approved manner of cultivating them lucidly treated; and there is a very instructive Calendar of work to be done in the Fruit Garden for each month in the year.

This work is an invaluable addition to our library and should be reprinted in this country, for there is no book that would be so universally acceptable to the cultivators of fruits, and the proprietors of public and private gardens.

2d. *Pyrus Malus Brentfordiensis*, or a Concise Description of Selected Apples, by Hugh Ronalds, F. H. S. Nursery man, Brentford, with a figure of each sort drawn from nature; 4to, price five guineas.

Mr Ronalds says, in the introduction, ‘that after more than half a century of constant practical attention, to their production, I have ventured to publish a descriptive catalogue of those varieties of the Apples, which I have thought most excellent, assisted by my daughter Elizabeth, who has drawn them on stone, from specimens of my own growth.’

The descriptions are concise, and disposed to point out, in a plain way, the distinct characters and qualities of each kind, with the name by which each is most generally known. The habit of the tree is given, with its history. Lists are added for the orchard, extensive and smaller gardens, for Paradise Stocks, for the purpose of sale and for walls.

This is truly a magnificent work. There are forty-two plates on which are delineated one hundred and ninety varieties of Apples, drawn and colored in the most accurate and beautiful manner, presenting a meritorious example of female taste, skill and industry.

Miss Ronalds has thus erected a splendid ornament to Pomona, which is honorable to her country and will perpetuate her name among the votaries of Horticulture, in every region of the globe. How glorious for the age, that ladies should be contending for the prize of renown, in science and the arts, and assuming that exalted

station in society, for which they were destined, by the God of their creation. With minds capacious and brilliant, and hearts more ardent and sensitive than man, they have an illustrious example of genius and talent in Miss Ronalds, which cannot fail of producing admirable results, in every civilized country. In letters how rapidly has the female character been elevated, and more cheering indications of its progress, in the highest intellectual attainments. What the lords of creation can perform, woman can equal in either physical or moral achievements, and if we are not derelict in duty, the period is not distant when she will exhibit all her long neglected, but most valuable qualities of admiration, the splendid developments of the mind. Psyche will resume her sceptre, and the rival goddess of personal charms be compelled to do homage to the more lovely divinity of the soul.

Respectfully submitted by

H. A. S. DEARBORN,
Pres. Mass. Hort. Soc.

Brinsley Place, }
Nov. 15, 1851. }

Resolved, that the thanks of the Society be presented to J. R. Van Zandt, Esq. for his valuable donation of seeds, and that they be divided among the members, on Saturday next.

Don Francisco Aguilar, Vice Consul of the United States at Maldonado, in the Banda Oriental, South America, was admitted, corresponding member.

Although the following article was published in the *Plough*, *Boy* eight or ten years ago, and a long controversy ensued, still we find many persons of much respectability, very positive that chess is the production of wheat. They say they have examined it closely, and almost detected it in the very act of turning into chess. In the hopes of leading farmers to more careful experiments, we continue the subject, and recommend the following to their attentive perusal.—*N.Y. Farmer.*

Extract from an Address delivered before the Agricultural Society of Cayuga County. By DAVID THOMAS.

‘I should greatly regret that the quantities of wheat and barley cannot be so expeditiously and accurately determined, were it not that the quality rather than the quantity ought to be the criterion of merit. Although good crops are greatly dependent on the hand of industry, yet wheat and barley are less so than any others and sometimes these appear so capricious, that were we regulated only by the quantity we should adjudge our premium to the underserving. There are other methods however, by which the careful farmer may be distinguished. The cockle, the chess, and various other weeds which pollute and impoverish the crop, will stand witnesses against the former class of cultivators; and I earnestly recommend that no premium be adjudged to him who may permit either of those two nuisances to remain in his fields. I trust there are not many who will think these conditions unreasonable. On a former occasion I called your attention to the subject of cockle. It was shown that the seed will lie for years, if not for ages, in pasture land; and I suggested that our care ought chiefly to be extended to this plant before it attain maturity. The employment of the rolling screen, as a precautionary measure, may also prove important. But whatever means the farmer may adopt totally to extirpate this plant, he will be encouraged during its prosecution, by

the conviction that the perverted vigor of no other seed will reproduce it.

‘I wish for the credit of some farmers that they could feel the same confidence of destroying chess. The vulgar opinion respecting the origin of this plant is too well known to need a recital, but perhaps all of you do not know that some are indifferent about its mixing with seed wheat or seed rye, alleging that it is never produced by its own seed. When error of opinion results in a practice so preposterous, it is time to enter our protest. Perhaps we have all been told of the appearance of this plant in fields of grain where it was never sown; but this seed is so small as to render its detection by a careless observer improbable. It is true that botanists have given us long lists of male or hybrid plants; but chess has never had a place assigned in this catalogue. It is not even pretended by the advocates of this notion that the seed wheat from which this monster is said to rise, was the offspring of vegetable adultery; they admit that the wheat may rise perfect from the ground, but after being injured by cattle, or in unfavorable situations, its nature becomes changed, and the stalk instead of being crowned with the golden grain is only burdened with the shrivelled chess. Now, it would be safe to assert that nothing analogous to such transformation can be produced from the vegetable kingdom. It may not be irrelevant however, to remark that chess, though a weaker plant than wheat is yet more hardy; and accordingly, where wheat is thick and flourishing the chess droops among the stubble; but, where cattle or excessive moisture have injured the wheat, chess springs with renewed vigor and fills the vacancy.

‘But I am well aware of the inefficacy of reason in combatting inveterate prejudices which have been cherished from infancy; and to convince the believers of that doctrine that it is founded in mistake, and unworthy of enlightened minds, I shall refer to facts that admit not of contradiction. The chess is a perfect plant, as different from wheat, as the latter is from rye or barley,—with seed completely capable of vegetating, and known in science by the name of *Bromus Sativus*. The botanist, who examines things with incomparably more care than the assertors of this doctrine,—would no sooner admit this plant to be a degeneracy of nature, because it grows in our wheat field,—than the zoologist would admit the sheep to be the degenerate offspring of the cow, because it feeds in the same pasture.

‘I shall mention another circumstance which to some may appear still more conclusive. A farmer who lives in the vicinity of Philadelphia, and whose veracity, I have known by long intercourse to be unimpeachable, lately assured me that for many years not one stalk of chess had appeared in his grain fields.’

Large Fruit.—We have never seen apples of such enormous size, as have been brought to this market this fall. It has not been uncommon to see loads which would weigh from twelve to twenty ounces each; and in some cases, they have been selected which would weigh twenty-two, three and four ounces. A pear was raised in Pittsford, which weighed forty-nine ounces and a half. We doubt whether any part of the United States has produced fruit of the same variety, of greater size and better quality than old Genesee.—*Gen. Farmer.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, NOV. 30, 1831.

FATTENING SWINE.

The corn given to your swine should be soaked, boiled, or ground into meal. It is an advantage to let the food for swine ferment a little, but not become very sour, before they are fed with it.—Dough made of meal and water mixed with boiled potatoes, is excellent for swine. Their lodgings should be dry, warm, and kept clean. To prevent measles and other disorders, and increase their appetites, a little brimstone now and then, given in their dough, is useful. Change of food is advisable in every stage of their existence. They should receive their meals with regularity. They should always have as much food as they will eat up clean; but never more than that quantity. If the issues in their fore-lungs should be stopped, they should be rubbed open with a cob.—Rubbing and carrying their hides very frequently is of advantage to keep up perspiration. It is grateful to the animals, as well as conducive to their health. Every sty should have a rubbing post.

"Having occasion," says Marshall, a celebrated English writer, "to shift two hogs out of a sty without one, into another with a post, accidentally put up to support the roof, he had a full opportunity of observing its use. The animals, when they went in, were dirty, with broken ragged coats, and with dull, heavy countenances. In a few days they cleared away their coats, cleaned their skins, and became sleekly haired; the enjoyments of the post were discernible even in their looks, in their liveliness, and apparent contentment." It is not probable that any animal should thrive while afflicted with pain or uneasiness. Grazers suffer single trees to grow, or put up dead posts in the ground, for their cattle to rest themselves against; yet it is probable that a rubbing post has never been placed intentionally in a sty; though perhaps for a two-fold reason rubbing is most requisite for swine.—London has the following observations:

"Hog-styes for the breeding or fattening of swine, are mostly built in a simple manner, requiring only warm dry places for the swine to lie in, with small areas before, and troughs to hold their food. They are generally constructed with shed-roofs, and seldom above six or seven feet wide, with height in proportion. In order that they may be convenient, they should be at no great distance from the house; and the less they are connected with the other farm-buildings the better. In some cases, it might be of utility to have them connected with the scullery, in such a way, as that all sorts of refuse articles might be readily conveyed to them by pipes or other contrivances. When at a distance, they should be so placed as that the servants need not enter the farm-yard in feeding them. It is a circumstance of vast advantage in the economy of labor, as well as food, to have them conveniently situated and built. Though swine are generally, perhaps from a too partial view of their habits, considered as filthy animals, there are no animals which delight more in a clean and comfortable place to lie down in, and none that cleanliness has a better effect upon with respect to their thriving and feeding. In order to keep them dry, a sufficient slope must be given, not only to the inside places where they are to lie, but to the outside areas, with proper drains to carry off all moisture. The outside should also be a little elevated, and have steps up from the areas of at least five or six inches in height. Hog-styes should likewise have several divisions, to keep the different sorts of swine separate; nor should a great many ever be allowed to go together; for it is found that they feed better in small numbers, and of equal size, than when many of equal sizes are put together. Proper divisions must, therefore, be made; some for swine when with the boar; others for brood swine, and for them to farrow in; for weaning the pigs, for fatten-

ing, &c. When convenient, the areas should be pretty large. And where it can be had, it is of great use to have water conveyed to them, as it serves many useful purposes."

Valparaiso Squashes.—Our friend and correspondent, Mr. A. Robinson, of Portsmouth, N. H. has raised 27 of these large South American Squashes, from two vines—they weighed from 15 to 20 lbs. each—the flesh is of a bright gold color, very close solid grain, boils tender, and is pronounced by Mr R. to be of a superior quality to any he has ever raised.

CHICKEN GRAPE.

Extract from a letter from John Adams, E. G. Georgetown, B. C. to the Editor of the New England Farmer.

I have purchased this year for the purpose of making wine, about 200 bushels of the chicken grape from persons that gathered them in the woods. I was surprised at the good quality of most of them. Many of the berries were as large and some larger, than the *Munier* or *Miller's Burgundy*. A bushel of clusters weighed from 34 to 36 lbs. and many of them were of fair quality for the table. A bushel of grapes produced nine quarts of pure juice. Some were more shriveled and produced from five to seven quarts of rich juice, to which I was obliged to add some water to dissolve the juice that adhered to the skin. From this experiment I felt quite satisfied that if the best native fall grapes were introduced into our vineyards, we should make a red wine that would bear a comparison with any of the wines now imported from Europe, for I have not tasted real good claret these twenty-five years; neither is the port such as we used to drink 30 to 40 years since.

Some of the best clusters of the grapes above mentioned were nearly a foot long, with shoulders, the berries the size of the claret grape; other bunches were from 6 to 8 inches long.

KNICKERBOCKER PICKLE.

We have several times, since the commencement of the *New England Farmer*, published a receipt for pickling beef and pork said to have been first used by Dutch families in the State of New York. It has been tried by many persons in this vicinity, and fully answered expectation. It is as follows. Take 6 gallons of water, 9 pounds of salt, half coarse and half fine, 3 pounds coarse brown sugar, 1 quart of molasses, 3 ounces sal. petre, 1 ounce of pearlsh.

Those ingredients form the pickle, which must be well boiled and carefully skimmed, and when quite cold poured over the beef or pork previously placed in the tub or barrel; then cover your barrel closely to keep out all dust. The pickle should be sufficient to cover the beef or pork. The above ingredients will make sufficient pickle for one hundred pounds of pork.

A respectable and scientific cultivator directs to deduct three fourths of the molasses used in this pickle. We presume that he approves of the other ingredients.

SWEET AUBURN.

The sale of lots at auction, yesterday, in the new cemetery at Cambridge, fully realized the highest expectations of all concerned. The first choice was sold to Samuel Appleton, Esq. for \$100; second choice to Benjamin Adams, for \$65; third to Abbot Lawrence, for \$50; several were struck off at an advance of \$30, besides a large number, at from \$10 to \$15 each. The number offered was 200, each containing 300 square feet.—*Trav.*

CHLORIDE OF LIME.

The disinfecting power of this salt was proved in a remarkable manner at the time of the July Revolution at Paris, in 1830. The *Journal des Connaissances Usuelles* for September, contains a letter from M. Chevalier to M. D'Arcy, in which the former states that in passing near the Morgue, (a place where persons found dead are exposed to view, in order that they may be owned and claimed by their relatives or friends,) after the memorable "Three days" he was offended by the putrid exhalations which rose from the corpses of some two hundred persons which had been deposited there. Fearing the consequences that might ensue, unless some preventive was adopted, he sent to the directors of the Morgue, and offered to supply them gratuitously with as much chloride of lime as might be necessary to arrest the infection.

His offer was accepted, and he proceeded to the place where the dead bodies were heaped up, and which they were about removing. He prepared a large quantity of the chloride and sprinkled it over them. As the bodies were borne away they exhaled a most fetid odor, but he persuaded the men who were employed in the work to wash their hands in a solution of the salt, every time they handled the bodies, which were also well sprinkled with chloride. The dry powder was scattered in every place where it was necessary, and the bodies as they were placed in the boat were covered with straw, over which the dry chloride was spread, and then sprinkled with water.

Notwithstanding the mass of putrefying matter the exhalations were completely overcome, or neutralized by the chloride, of which the quantity used was only thirty-five pounds, and cost, probably, less than two dollars.—*Boston Trav.*

New Haven against New England's sweet potatoes.—Mr Henry Daggett of this city, has this season raised from one quarter of an acre of ground sixty bushels of sweet potatoes. We challenged New England, but we say in addition, let this be beaten in Carolina; yea, in the West Indies, if it can. There are in this lot, the largest and handsomest potatoes that we ever saw, and we have been where they grow wild. There is one of the round kind that measures nineteen inches in circumference, and weighs five pounds and one ounce. Others are eighteen inches, and two feet long. This is no fish story, though it is a large one. Mr Daggett deserves a premium from every agricultural and horticultural society in the country.—*New Haven Republican.*

The *Portsmouth Journal* mentions several instances of consequences nearly fatal resulting from persons sleeping in an unventilated apartment warmed by charcoal. A caution on this subject needs to be repeated every winter. To sleep in a close room where there is a lighted lamp, not well trimmed, has also an injurious effect.

The melon.—Mr Reynolds has communicated to the Society of Arts in London a method of raising melons without earth, manure or water. He employs tanner's bark, saw-dust, &c, to promote the vegetation of the seeds.

WALNUT TREES.

These trees may be raised with trifling expense. Col. Adoniram Crane of Berkeley, in this

county, has a tree which he planted in 1814, from which he gathered a large quantity of Shagbarks of a fine quality the present season. The tree five or six feet from the ground, measures thirty inches in circumference.—The nut must be planted in the fall season in order to have the frost operate upon it. It may be planted either with or without the outside covering or husk upon it; the shell of the nut must not be cracked before planting. The tree thus raised begins to bear at five or six years old. Mr Crane has a nursery of these trees in a course of cultivation. *Thunton Reporter.*

Milk Sickness.—We have been informed by an old resident of this county, that for the last ten years he has been in the habit of putting tar in the troughs and of salting his cattle upon the tar; and of mixing the salt with it, as much as could well be done, and that when his cattle use the salt and tar freely, he has never lost one to his knowledge with *Milk Sickness*—but if his cattle stray or by any means are deprived of the use of the salt and tar, he is sure to lose them—he salts several times in the week, and very freely—we know that our informant lives in the midst of a neighborhood subject to this afflicting complaint and is worthy of all credit—Let others go and do likewise—the experiment can cost but little.

Cabbage Soup.—The liquor remaining in the pot in which cabbage, potatoes, and a sweet, fat piece of beef have been boiled, is a very pleasant soup. Most house keepers in the country throw it away or into the swill barrel.

The Water With. in Jamaica, which is like a vine in size and shape, and grown in dry districts, is so full of sap, that a plentiful draught is obtained, by cutting a piece two or three yards long and holding it to the mouth.

Sago.—This is the starch of a tree which grows in the East Indies. The natives cut the stem and branches in two, and dig out the pith; this is then washed, passed through a perforated copper-plate, to reduce it to grains, which are then dried and form Sago of Commerce. From the same tree is obtained a liquor, as pleasant as our wine. From the cotton, with which the leaves are covered when young, clothing is made; when older, the leaves are used instead of tiles for houses; the largest also serves for building; the two smaller yield a kind of hemp, fit for making ropes.

Two or three Compositors
Will find employment at this office. Nov. 30.

Presses for Sale.

For sale at this office, or by J. G. Rogers, at the Boston Type and Stereotype Foundry, one Supercyl Iron Smith Press, warranted perfect, and one Medium Washington Press.

Also, two medium Iron Inking Machines, of Fair-lamb's last improved manufacture. They have been used but a short time. Nov. 30.

Mackay Pigs.

For sale, 10 first rate pigs, of the genuine Mackay breed. They are about six weeks old, of good size and fine form. Inquire at the N. E. Farmer Office.

Fruit Trees.

Peach—Pear—Apple and Cherry Trees, very thrifty, and in fine order for setting, for sale at Wm. Buckminsters Nursery, in Framingham. Nov. 9.

Pear Seeds.

For sale at the Seed Store connected with the New England Farmer Office—
One bushel of fresh Pear Seeds, of excellent quality. Nov. 30.

Flooring Boards, &c.

Of hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr. 65, Broad street.

Seeds for Country Dealers.

Traders in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed they can be furnished at the New England Farmer office, No. 50½ North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as they can be procured in this country, neatly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and LATE CORN, &c. of different sorts.

[] The seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves. Nov. 12.

Grape Vine Plants.

For sale at the garden of S. G. Perkins, in Brookline, on the most favorable terms. The plants may be seen and purchased at the Garden at any time; or orders may be sent with Mr Perkins at his office, corner of State and Congress streets.

The vines are from one to four years old, in fine order, with wood enough of this year's growth attached to most of the plants to make a dozen or more vines.

Chasselas, common white, or Muscadine.

Chasselas de Fontainebleau, or *Thomery*.

Chasselas d'Orie, Bar Sur Aube.

Chasselas, red.

Chasselas, Moscat.

Black Hamburg.

Black Cape.

E-perione, black.

Frankenlaid, do.

St Peter's, do.

Zenfaedel, by some called the Black Prince; the bunches produced on this vine are very large.

Isabella.

Muscat of Alexandria.

Muscat, red.

Muscat, Grizzly.

Muscat, white frontenac.

Muscat, purple.

Constantia—the sweetest of all Grapes, and a great bearer; the berries contain but one seed generally, and sometimes none at all. SAMUEL G. PERKINS.

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery. Trays of all kinds, Fancy Goods, &c. &c, which he will dispose of at as low a rate as can be purchased in the city. [] Watches repaired and warranted.

European Leeches.

The subscriber has made such arrangements abroad as to enable him to be constantly supplied with the genuine medical Leech. All orders will receive prompt attention. EBENEZER WRIGHT,

46, Milk street, opposite Federal-st., Apothecary. August 8. eopf

Buckthoras.

Gentlemen in want of this valuable plant for live fences can have young quicks about 3½ feet high, for \$3 per hundred, and plants 2½ feet high, for \$2.50 per hundred, by leaving their orders at the office of the New England Farmer. They are raised in the vicinity of Boston, are in the very finest order, and will be well packed. A small charge will be added for freight.

White Mulberry Trees.

The subscriber has procured a plantation of White Mulberry Trees, of suitable size and age, which he offers at a low rate at his Nursery in Worcester, in lots to suit purchasers. O. FISKE.

Worcester, Nov. 22, 1831.

BOSTON VEGETABLE MARKET.

Prices at Faneuil Hall Market.—Cranberries, per bushel, \$1.60—Cauliflowers, per head, 17 cts.—Cabbages, per doz. 38—Sweet Potatoes, per bu. \$1.50—Chesnuts, per bu. 2.25—Shagbarks, do. 3.00—Onions, per bbl. 1.50—Winter Crookneck Squashes, per 100 lbs. \$1—Small Canada, do. 1.50—Carrots, 50 cts.

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

New England Farmer's Almanac for 1832.

Just published by J. B. Russell, at the office of the New England Farmer, 52, North Market Street, and Carter, Hendee & Babcock, Washington Street, The New England Farmer's Almanac, for 1832, by T. G. FISSENDER, Editor of the New England Farmer—the Astronomical calculations by ROBERT T. PAINE, Esq.

Cobb's Treatise on Silk.

Just published, and for sale at the Agricultural Warehouse and Seed Store, No. 50½ North Market street,

A Manual, containing information respecting the Growth of the Mulberry Tree, with suitable Directions for the Culture of Silk—In three parts—with colored engravings. By J. H. Cobb, A. M. Published by direction of His Excellency George. Lincoln, agreeably to a Resolve of the Legislature of Massachusetts. Price 37½ cts. Oct. 26.

MISCELLANY.

Earl Fitz William.—The following story is so pretty in itself, and so creditable to both parties, that we cannot refuse it a place in our columns. A farmer called on Earl Fitz William to represent that his crop of wheat had been seriously injured in a field adjoining a certain wood, where his Lordship's hounds had, during the winter, frequently met to hunt—and he estimated the damage his crops had suffered at 50*l*. The Earl immediately gave him the money. As the harvest approached, however, the wheat grew, and in those parts of the field that were most trampled, the corn was strongest and most luxuriant. The farmer went again to his Lordship: 'I am come, my lord, respecting the field of wheat adjoining the wood.' 'Well, my friend, did I not allow you sufficient to remunerate you for your loss?' 'Yes, my Lord, I have found that I have sustained no loss at all, and I have, therefore, brought the 50*l*. back again.' 'Ah,' exclaimed the venerable Earl, 'this is what I like—this is as it should be between man and man.' He then entered into conversation with the farmer, asking him some questions about his family, how many children he had, &c. His lordship then went into another room, and returning, presented the farmer with a check for 100*l*. 'Take care of this; and when your eldest son is of age, present it to him, and tell him the occasion that produced it.'—*English paper.*

Lady Kent.—Lady Kent artieled with Sir Edward Herbert, that he should come to her when she sent for him, and stay with her as long as she would have him, to which he set his hand; then he artieled with her that he should go away when he pleased, and stay away as long as he pleased, to which she set her hand. This is the epitome of all the contracts in the world, betwixt man and man, betwixt prince and subject; they keep them as long as they like them, and no longer.

To make Sealing Wax.—Those who use large quantities of sealing wax may find it economical to make it, which is very easy. Take equal weights of gum lac, vermillion, and pure Venice turpentine. Melt them over a gentle heat, and stir them well together. Take a detached portion of the mass, and roll it with the hand upon a plate of copper slightly heated; or rather it may be cast in a mould made on purpose, of plaster, of horn, or of copper. Instead of vermillion, other colors may be used, according to the tint which it is desired the wax may have.—*Jour. de Connoiss. Usuelles, Sept. 1831.*

To make Rice Bread.—Boil a pint of rice soft; add a pint of leaven; then three quarts of flour; put it to rise in a tin or earthen vessel until it has risen sufficiently; divide it into three parts; then bake it as other bread, and you will have three large loaves.

Polite Hint.—A courtier playing at piquet was much teased by a looker-on, who was short sighted, but had a very long nose, of course, put his face very close to his cards, when he made his observation. To get rid of so troublesome a guest the courtier drew out his handkerchief, and applied it to the nose of his officious neighbor. 'Ah! sir,' said he, 'I beg your pardon, but I really took it for my own.'

THE FARMER.—Happiness seems to have fixed her seat in rural scenes. The spacious hall, the splendid equipage, and the pomp of courts do not soothe and entertain the mind of man in any degree, like the verdant plain; the enamelled mead, the fragrant grove, melodious birds, the sports of beasts, the azure sky, and the starry heavens.

It is undoubtedly a fact, that in proportion to our population too many leave the occupation of the agriculturist, for other employments. If this arise from his being considered that the employment of the farmer is not respectable, it is a very great mistake. Everything is honorable, which is useful and virtuous. This is an employment instituted by God himself, and by him particularly owned and blest. It is that on which everything depends. True, it is laborious; but then labor brings health, and health is the foundation of the farmer, is the condition of independence. His little dominion is his own, his comforts are his own, and he is not at the mercy of the public whim and caprice.—It is not necessarily the case, in this happy country, especially, that the farmer must be a stupid ignorant man. He is taught in his youth the first rudiments of education, and he has many spare hours to read. In the heat of a summer's noon, and by the long winter evening's fire, he has much time for his books, and in this country they are placed within the reach of all.

From the Journal of Health.

Abstinence a Beautifier.—On entering, says the author of a Year in Spain, the cottage of the Hermano Mayor he came to the door to receive me, signed the cross over me, and pressed my hand in token of a welcome reception. Like other hermits, the Hermano Mayor wore a large garment of coarse cloth, girded round the middle with a rope, and having a hood for the head. The only covering of his feet consisted of a coarse shoe of half-tanned leather. Yet there was something in his appearance, which would have enabled one to single him out at once from a whole fraternity. He had a lofty and towering form and features of the very noblest mould. I cannot tell the curious reader how long his beard was; for after descending a reasonable distance along the chest, it returned to expand itself in the bosom of his habit. This man was such a one as, in any dress or situation, a person would have turned to look at a second time; but as he now stood before me, in addition to the effect of his apostolic garment, his complexion and his eye had a clearness that no one can conceive, who is not familiar with the aspect of those who have practised a long and rigid abstinence from animal food and every exciting aliment. It gives a lustre, a spiritual intelligence to the countenance, that has something saint-like and divine.

A good hook and a good woman are excellent things for those who know how justly to appreciate their value. There are men, however, who judge of both from the beauty of their covering.

Cider cake is very good, to be baked in small loaves. One pound and a half of flour, half a pound of sugar, a quarter of a pound of Butter half a pint of cider, one teaspoonful of pearl ash; spice to your taste. Bake till it turns easily in the pans, I should think about half an hour.

FRUIT TREES.

For sale at the KERRICK NURSERIES, in NEWTON, near Boston, a most extensive assortment of Apples, Pears, Peaches, Plums, Cherries, Apricots, Nectarines, Almonds, Mulberries, Quinces, Raspberries, Gooseberry and Currant bushes, Grape Vines of the best foreign sorts, and 25 finest varieties of Strawberries, including the most rare, productive and esteemed.

Also about 40 varieties of the most hardy ornamental trees and shrubs, and superb hardy roses, including Silver Fir, varieties of Spruce, Flowering House Chestnuts, Flowering Catalpas, Mountain Ash with beautiful clusters of red berries in autumn and winter, Purple Aescia, Three Thorned and Thornless Aescia, Bittersweet, Atlantic or tree of Heaven, Elms, American and Scotch, Sugar Maples, Weeping Willows, &c. do. Napoleon from St Helena tree, Honeyuckles. Many of the above sorts of trees of extra sizes, for ornamenting highways and commons.

WHITE MULBERRIES, genuine sort for silk worms, by the 100 or 1000 for plantations.

LEAVYELLA and CATAWBA Grape Vines, either singly or at reduced prices by the 100 or 1000.

CHINA ROSES, CHINESE CHRYSANTHEMUMS, GERANIUMS, &c. &c.

Written orders addressed either to JOHN or WILLIAM KERRICK, NEWTON, are regularly received by the daily mail, and will be promptly attended to, or they may if more convenient be left with J. B. Russell, at the New England Farmer office, where also, catalogues may be obtained gratis on application. But purchasers are invited when convenient to call and examine the trees, &c. for themselves, and make their own selections; but when this is not convenient, then let them forward their orders, relying that the very best possible selection will be made for them. Trees when destined for a distant place, are carefully packed either in clay or moss, and mats, and delivered whenever ordered in Boston free of any charge for transportation. cpd11 Oct. 19.

Immunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 67 South Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned. 30.

Pear Seedlings.

For sale at the Agricultural Warehouse, No. 52 North Market Street—

PEAR SEEDLINGS, of vigorous growth, and promising appearance, raised within six miles of Boston, in fine soil for nurseries—the largest size are from 18 to 24 inches in length, the whole plant; price \$10 per thousand; the second size from 12 to 18 inches in length, price \$5 per thousand. They will be suitably packed as wanted, for transportation to any distance. Oct. 19.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly bound and lettered, at 75 cts. per volume, by leaving them at the Farmer office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

Printed for J. B. RUSSELL, by L. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for printing received by J. B. Russell, at the Agricultural Warehouse, No. 52 North Market Street.

HEATING HOT HOUSES BY HOT WATER.

Boston, Nov. 25, 1831.

THOS. G. FESSENDEN, Esq.

DEAR SIR—Permit me to ask your opinion on the following points in relation to heating hot houses with hot water, as you are better informed perhaps, than any other person in this country upon the principles of the method generally; and being as I understand much interested in the subject may think it of importance enough to investigate such facts as are not already familiar to you.

Having as you know erected an apparatus for heating a house eighty feet long with hot water upon principles which I supposed to be correct in relation to the object I had in view; that is, to keep up a regular and safe heat, during our long winter nights, without the necessity of an attendant after the usual time of retirement to rest, and with a view to the economy of fuel by this method over that of heating by smoke flues, I have been somewhat surprised by opinions that I understand have been given by highly respectable gentlemen in this neighborhood, which if correct, render my labors useless and the expense I have been at a total loss; and for this error I am indebted to Mr Atkinson the inventor.

As some gentlemen have taken directions from me with a view to establish a similar apparatus, I think it my duty to make public my error, if I have committed one, that they may be prevented from falling into a like mistake; under these circumstances you will oblige me by showing the defects of my apparatus, that others may profit by your experience and knowledge on this subject, if it be no longer in my own power to do so. The first objection, I understand, which is made is to large boilers and large reservoirs; and as mine are of this description it is an important one to me. The second is to placing the upper pipe three inches below the rim of the kettles, it being contended that it ought to be placed at the highest point in them; and as my pipe is according to the first plan it must be useless. The third is depending on hot water alone; it being urged that there ought to be a brick or smoke flue also in the house. The fourth is the enormous quantity of coal or fuel that this mode of heating requires where the apparatus is large. And the fifth is one that does not immediately affect me, but does others who have two pipes running from the upper part of their kettles while they have but one lower pipe of equal size to return the water from the reservoir to the boiler. It is said that if there be not two lower pipes where there are two upper ones the one that returns the water to the boiler ought to be equal in size to both the upper ones.

In answer to the first objection, I must observe that the terms *large* and *small* in this case are relative, and cannot be defined except in connexion with the size of the house to be heated, that is, the number of cubic feet of air which the house contains, and the time that it is desirable to keep up the heat after the fire is extinguished.

There is no doubt that a house may be heated much sooner with a shallow broad bottomed boiler without any reservoir at all, or with a very

small one, than it can be with a large boiler and large reservoir; but the heating of the house quickly is not the only object to be obtained; you want not only to heat your house but to keep up a sufficient degree of heat many hours after the fire has gone out; to accomplish this there must be a quantity of water heated sufficient to produce this effect. Mr Tredgold says in his letter to the secretary of the London Horticultural Society in reviewing a communication from Mr Atkinson to that society on this subject, 'But the most important of the properties of the hot water method, as first tried, consists in the power it has of keeping up the temperature of the house for a long period without attention from the attendant; and it is entirely owing to the excess of fluid that it has this advantage over steam heat; and the exact knowledge we now have of the heat which water contains, in proportion to its temperature, enables us to calculate the time the cooling of the fluid will maintain the heat of the house.' That gentleman further says that gardeners object to large boilers, and large reservoirs, on account of the time it takes to heat them; but the excess of water over and above what is necessary to heat your house while the fire is kept up, is a reserve of heat to be given out after your fire is extinguished and he recommends as an improvement of Mr Atkinson's apparatus with a large boiler and large reservoir to pass the pipes through the water of the reservoir as thus—

That Mr Tredgold is in favor of large boilers and large reservoirs where a reserved heat is required to keep up the temperature of the house after the fire is out, and that he thinks them absolutely necessary, appears in many instances in his letter to the secretary. Referring to one of his shallow boilers he says; 'if a boiler have sufficient surface to receive the effect of the fire, and the whole apparatus contains as much water as will convey the heat from the fire to the heating surface in the time corresponding to its velocity, its capacity need not be further increased, except as a reservoir of heat to act when the fire ceases to burn.'

What does this mean? Why if you want a temporary heat, or one that can be kept up while your fire is burning under the eye of an attendant, a shallow or small boiler will answer your purpose; but not so if you want to keep up the heat any time after your fire has gone down. So he says again. 'Where heat is required only during the action of the fire, a large surface in proportion to its capacity may be used with advantage to give of heat over the descending pipe.' Mr Tredgold seems to think that where a reserved heat is required to keep up the temperature of the house

after the fire has gone out, large boilers cannot be dispensed with.

There is another theory maintained here by one of the gentlemen referred to, which is, that you should have a small boiler and a large reservoir, in place of two kettles of equal size; by which means, it is contended, you can heat any given quantity of water with less fuel, if not in less time than you can if the water is equally divided in the two vessels. I confess I cannot understand how this can be done.

Suppose for instance the size of your house should require 280 gallons of water heated, to keep up the temperature of the house eight hours after the fire has gone out; in one instance the water is equally divided into two kettles, 70 feet from each other, each containing seventy gallons of water, making 140 gallons; the rest of the water is contained in two pipes each 70 feet long with a bore large enough to contain the residue of the water, or 140 gallons more, making in all the 280 gallons to be heated; this is the case in my house.

In the other case the water is distributed into two kettles, the boiler containing only twenty gallons and the reservoir 120 gallons and the pipes, as before, 140 gallons; making, as in the preceding case, 280 gallons in all; can the 280 gallons of water in the last distribution be heated sooner, or with less fuel, to the temperature of 185 deg. than it can in the former one? This is a question of importance and if it can be truly answered in the affirmative, then I cannot account for the oversight of Mr Tredgold in not mentioning it as an improvement on Atkinson's plan, if it be one in fact.

But suppose that it could be heated with less fuel and quicker too; the question then arises, would it answer as well to keep the house at a proper temperature during the night at both its ends? The fire being extinguished the whole mass of water soon becomes of the same temperature; in the reservoir however you have six times as much water giving out heat as you have in the boiler; will not it be where the reservoir stands be kept warmer and warmer enough, when the other end of the house will be cold?—But Mr Tredgold has given plates of seven different modes of heating hot-houses by hot water, six of which differ from Mr Atkinson's, four of the six are with shallow boilers and no reservoirs;—one with a large deep boiler and no reservoir; and one with deep boiler and deep reservoir covered at the top with high upright pipes, both in the boiler and reservoir for the purpose of carrying the water over a door in the house; but the apparatus with a small boiler and large reservoir, he seems to have forgotten.—This may be seen in his letter to the Secretary of the Horticultural Society, No. vii, part iv. of the Transactions.—It does appear to me that if this mode of heating with a small boiler and large reservoir had possessed any advantages over two large kettles of equal size, Mr Tredgold must have seen it. I am more particular on this point, because several gentlemen have mentioned it to me as an improvement on my apparatus—not that I ever for a moment could understand, or believe in its efficacy.

The next objection made to Atkinson's apparatus is the placing the upper pipe three inches

below the brim of the kettle.—It is urged that it ought to be placed at the highest point in the boiler and reservoir.

Any one who looks at Mr Tredgold's plates will see that this is not the fact; and the very means by which the circulation is produced through the apparatus shows that Mr Atkinson is right in directing the upper pipe to be placed three inches below the brim of the kettles; for if you were to place your upper pipe near the rim of the boiler, the moment the water was heated to a sufficient temperature to produce a circulation, your boiler would overflow and you would lose all the advantage which is derived from its expansion.

Mr Tredgold says—'the aperture of the upper pipe should not be more than about an inch below the surface of the water, or as much as prevents its drawing air in an open boiler.' Now here is an inch of water allowed by Tredgold above the upper part of the upper pipe in the outset, when the water is all cold.—'If heat be applied to the boiler,' continues Mr Tredgold 'the effect of the heat will expand the water in the boiler, and its surface will in consequence rise to a higher level.' This he marks in his plate about one and half inches above the level of the water when cold; of course the water in the boiler is raised two and a half inches above the upper part of the pipe, and if there had not been sufficient space left above the pipe, it would have run over; and as the circulation depends on this head of water, through its tendency to produce an equilibrium, it cannot be dispensed with in any case, or in any apparatus, whether open or closed, shallow or deep, great or small, that I can perceive.

The third objection made to Atkinson is, that he depends altogether on his hot water without the auxiliary of smoke or brick flues, by the aid of which, it is said, the temperature for a long time may be raised many degrees above the heat from the hot water pipes, and that this heat ought not to be lost. I had conceived that one of the principal objects of heating with hot water, was to get rid of smoke flues; and Mr Tredgold seems to me to favor this opinion very strongly. He says in the letter to the secretary above referred to—'The obvious advantages of this method are

1st. The mild and equal temperature it produces, for the hot surface cannot be hotter than boiling water.

2d. The power of heating such a body of water as will preserve the temperature of the house many hours without attention.

3d. The freedom from smoke, and other effluvia of smoke flues.'

'In houses for plants,' says he, 'these advantages are most important.' Here then Mr Tredgold thinks one of the obvious advantages of hot water apparatus is to exclude smoke flues.

The fourth objection made to this mode of heating with large boilers and large reservoirs is on account of its great consumption of fuel; which, if well founded, is a very serious one, and indeed fatal to its usefulness where economy is an object. But I can see nothing in Mr Tredgold's communication which justifies this belief. From my own experience, which is to be sure but small, I should doubt the fact. On the contrary, I believe that a house eighty feet long may be kept at a proper degree of temperature during the twenty-four hours, by this method, with one third the fuel, to speak

within bounds, than a brick fire would consume in a building of the same dimensions. But I may be mistaken, and shall wait until I can test the fact, as I hope to be able to do the coming winter.

The fifth objection to Mr Atkinson is the introduction of two pipes at the upper part of the kettles to convey the water from the boiler to the reservoir and one only at the bottom to return the water from the reservoir to the boiler.

It is said that the pipe below must be as large as both those at the top or the circulation will be checked.—Is this correct?

When the water in the boiler is heated to a proper temperature it will be raised by expansion, as in the case before stated;—and although the density of the water in the boiler will decrease in consequence of its expansion yet as soon as the head or column of fluid in the boiler above the centre of the upper pipes is of a greater weight than the column or head in the reservoir taken from the same level, motion will commence along the upper pipes from the boiler to the reservoir; and the change this motion produces in the equilibrium of the fluid, will cause a corresponding motion in the lower pipe from the reservoir to the boiler,' so says Mr Tredgold.—Now when ten gallons of water are displaced from the boiler through the upper pipes, is there not a corresponding quantity let into the bottom of this vessel from the lower pipe immediately, to produce the effect above stated? What odds does it make whether the lower pipe be smaller or larger than the upper one? it can only discharge so much water in either case into the boiler as will produce the equilibrium above spoken of, and if the lower pipe be larger than the upper one the water from it will move more slowly; if it be smaller, it will move more rapidly. This at least is my view of the subject, and if I am wrong I should like to be corrected. If I am right, then it follows that if the two upper pipes, each 4 inches in diameter, take off ten gallons of water from the boiler in ten seconds, the same quantity will be replaced from the lower pipe (which is also a 4 inch bore) in the same period of time; but the motion of the water in the lower pipe will be twice as great as that in the upper pipes. The only reason why I should want my lower pipe as large as my upper one is, because the greater its caliber the more water there is to be heated to serve as a reserve heat; and the greater the surface over which this heat is given out after the fire is extinguished.

In an apparatus to be used only during the attendance of the gardener, if my upper pipe would give me heat enough to raise the house to a proper temperature, I believe a returning pipe of one third the size of the other would answer all the purpose required. The only question in my mind is, as the friction in small pipes is greater than in large ones, whether any obstruction arising from this cause would retard the motion?

There is one construction of apparatus by Mr Atkinson which has been erected here under his written directions, of which I confess I feel much doubt as to its operation; it is this—the boiler being in the shed behind the back wall of the house, has one upper pipe only leading from its top, to across the end of the house to a square iron box in the front of it.—From this iron box there are two upper pipes of the same size as the first named leading along the front of the house fifty feet into another square iron box; and from the side

of this box there is one upper pipe only to convey the water to the reservoir across the house to the back wall, where it is placed. From the reservoir there is only one returning or lower pipe back to the box in front of it, and thence to the box in front of the boiler, and thence to the boiler itself.—It is said this plan is entirely defective. I own I should prefer to have the two upper pipes run directly from the boiler to the reservoir and to have the lower pipe return in the same manner. But if Mr Atkinson communicated this plan to the secretary of the horticultural society, I am surprised that Mr Tredgold did not, in his review of that article, point out its defects. I should think that the acute angles where the pipes join the boxes would retard the circulation of the water. I should also apprehend that the single upper pipe leading across the house from the boiler ought to be large enough to convey as much water to the box in front of it, as is taken off by the two upper pipes that run in front of the building; but experiment alone can show the fact.

I have written you so long a letter I am ashamed to send it to you—but as you are as interested in the subject as I am and know much more than I do of its principles I trust you will excuse the trouble I am giving you to peruse and answer it.

With much esteem and respect, I am, dear sir,
Your obedient servant,

SAMUEL G. PERKINS.

By the Editor.—Although my respected correspondent has given me credit for much more science on the subject he has discussed than I possess, I cheerfully contribute my note to the treasury of useful information on.

Heating rooms, &c, by steam, is a modern invention, and the use of hot water for warming hot houses is of still later origin. In the London Philosophical Transactions for the year 1715, it is stated that Col. W. Cook suggested the idea of employing steam as a means of distributing heat. Steam has since been applied for that purpose in Great Britain and in the United States in various ways, and a great many patents have been granted in both those countries for real or supposed improvements in that branch of economy. 'The first of these Patents,' says Mr Tredgold, (*Treatise on Warming and Ventilating Rooms*, &c. p. 11.) 'was granted to John Hoyle, of Halifax, in 1791, for a mode of communicating heat to green houses, churches, &c. His plan consisted in conveying steam in pipes or tubes into, round or through the place to be warmed; the pipes being first raised to their highest elevation, and then descending with a gentle declivity to a cistern for the condensed steam: the supply of water to the boiler to be regulated by a ball cock, (*Rep. of Arts*, vol. 1, p. 300—303 old series.) This scarcely differs in anything from Col. Cook's plan, which had been known forty years sooner. In 1793 a patent was granted to Joseph Green, whose mode of application was different, and has had the honor of being adopted, with slight variations of form, by a number of later projectors. His method consisted in passing fresh air through a worm or pipe, immersed in hot water or steam, by which means the purity of the air was to be preserved. When the heat was conveyed to a distance, he says, 'I inclose the pipes through which the warm air is conveyed in large pipes to which the steam rises from the boiler.—(*Rep. of Arts*, vol. 1, p. 21—24, old series.) Col. Cook's idea was neglected, no doubt because it promised too much. Whoever attempted to warm a large suite of apartments by the spare heat of a kitchen fire would fail, because so small a quantity of heat is

quite inadequate to produce such an effect. But, when revived with less pretension, steam was found to be a convenient and economical mode of distributing heat.*

London says, 'Pipes of hot water have been proposed to be circulated through hot houses by Knight, (*Hort. Trans.* vol. iii); the plan was tried many years ago by the late Goult, gardener to Prince Potemkin, in the immense conservatory of the Tauridian palace at Petersburg.'—*Enc. of Gard.* p. 328.

The advantage to be derived from heating hot houses by hot water is the consequence of the great capacity of water for heat. Suppose a gallon of water was heated to 212 degrees, the boiling point, and a gallon of air was also heated to the same temperature. The water would contain, according to the lowest estimate, (for philosophers are not perfectly agreed on this subject,) five hundred times as much heat as the air. If the water and the air, when so heated, were each of them confined in similar water tight and air tight vessels, in contact with as much ice as each could melt in cooling, the hot water would be found to have melted at least five hundred times as much ice as the hot air. Water too, when heated, will be at least as much longer in cooling than air, of the same temperature, as it contains more caloric.

* Water, says an eminent philosopher, 'appears to possess the greatest capacity for heat of any pure liquid yet known, whether it be compared with equal bulks or weights; indeed it may be doubted whether any solid or liquid whatever contains more heat than an equal bulk of water of the same temperature. The great capacity of water arises from the strong affinity, which both its elements, hydrogen and oxygen, have for heat. Hence it is that solutions of salts in water, contain generally less heat in a given volume than pure water; for salts increase the volume of water, as well as the density, and having mostly a smaller capacity for heat, they enlarge the volume of water more than proportional to the heat they contribute.'"

It is, however, remarked by Mr Tredgold, that the boiling points of solutions of salt and some other liquids are higher than the boiling point of water. Linseed oil, for instance, will not boil until it is heated 600 degrees, or made almost three times as hot as boiling water. Consequently we should need only one third as much surface of pipe, and one third the capacity of boiler and reservoir for heating a given space with boiling oil as with boiling water. But solutions of salts are corrosive, and oil very inflammable, as Mr Tredgold correctly observes. On the whole, we believe there is nothing like water to seize and retain the heat produced by combustion, and prevent its escape into the open air before it has been subservient to any purpose of economy.—Steam is an excellent agent to carry and distribute heat. With the help of a little skill in its management, it will go where you bid it, and leave its commodity of caloric where most needed. But it carries but little heat at a load, in proportion to its bulk and temperature. It requires large surfaces of pipes or other receivers, in proportion to the space it warms. And in a few minutes after the fire which creates it slackens or is extinguished, the vessels it filled become as cold as the air which surrounds them. Hot water carries and distributes much more heat than steam in proportion to its bulk and temperature, requires less apparatus, and heated surface for emanating a given quantity of heat, and will continue to give out warmth for hours after its supplies from the fire place are cut off. But it must be dealt with according to the laws of hydraulics and hydrostatics, and though more efficient when it begins to act, is not so readily brought into action as steam.

With regard to large boilers, and large reservoirs, which Mr Perkins says are objected to, we can say nothing either from our own experiments, or from personal observation; and shall merely give the opinions of such writers as we have been able to consult; together with some remarks, founded on analogy, and the little experience we have derived from a portable apparatus, which we call a Steam and Hot Water Stove, (for which the writer has obtained letters patent) for heating apartments, &c., by the agency of hot water and steam. In addition to what Mr Tredgold observed, (as quoted above by Mr Perkins,) in favor of a large boiler, 'as a reservoir of heat, to act when the fire ceases to burn,' it may be stated that the experiments of Count Rumford, (*Essay* vi. chap. v.) are in favor of large boilers. For, in order to keep 508 pounds of water boiling, the expenditure of fuel by the hour was something short of one eighteenth part of the weight of the water; whereas, in a smaller boiler, holding only 284 pounds of water, the expenditure of fuel was more than one twelfth part of the water.—Mr Tredgold judiciously observes that 'the bottom of the boiler should have sufficient extent of surface to receive all the force of the fire, as far as the heat of it is capable of being extended, so as not to be less than 212 degrees; a greater surface will not generate steam; a less will not produce the greatest effect. And it is clearly a disadvantage to suffer the smoke of the fire to come in contact with the boiler after its heat is less than that of boiling water; for if it be continued in contact with the boiler, it will rob it of heat instead of adding to the effect of the fire.'

If the boiler is less than the reservoir, its perpendicular height should be at least as great, in order to insure the quick circulation of the fluid.

Mr Tredgold says, 'all other things being the same the velocity will be increased in proportion to the square root of the depth of the boiler; therefore in a boiler four times as deep the velocity would be doubled.'

Among the several plans, which Mr Tredgold has given as improvements on Mr Atkinson's, we should prefer the one sketched above by Mr Perkins, with this alteration, which might not however be an improvement.—The reservoir we would make much larger, in proportion to the boiler, than is there represented. We would do this because all water, however low its temperature may be, contains a large portion of caloric. A large quantity of water drawn from a well or taken from a spring in the winter time, and placed in open vessels in a cellar, not subject to frost, generally protects vegetables, &c., from being frozen. This is a fact known and practised upon by many a good housewife, whose philosophy never dreamt of the cause. This we will briefly explain. Water at the mean temperature of this climate contains more than 20 degrees of heat, which it must give out before it can freeze, and while freezing, it gives out 140 degrees, according to Dr Black. This heat is yielded to surrounding objects, including the vegetables, &c., in the cellar, which keeps the temperature above the freezing point of 32 degrees, till the water is frozen and can give no more heat. The vegetables, &c., will then freeze if the weather continues sufficiently cold, and no other supply of caloric is provided. We see no reason to dissent from the other statements of Mr Perkins, whose remarks appear to us judicious and scientific.

We hope the importance of the subject will apologize for the length of this article; and intend to resume the discussion as soon as our avocations and pre-engagements will possibly permit.

VARIETIES OF OAKS.

MR J. B. RUSSELL—

DEAR SIR—Observing in your paper that several persons have been forwarding *Acorns*, for a collection to be sent to the Horticultural Society of London, I take the liberty of including you, herewith, the list, or catalogue, of those which I have put up already this season, and forwarded to that Society, by the ship *Fanny*, from this port. They were all collected this fall, from this garden, and the immediate vicinity; and several other sorts, which failed to bear seeds, this year, will be sent to that society next fall. We always collect our *acorns*, and other seeds, from the purest standard plants, and do not collect them in the woods, nor purchase them from others, unless they are gathered from trees which we point out. Of the Oaks, in our woods, the mixtures, or hybrids, are infinite; I can collect 11 or 12 different sorts of acorns of the *Quercus alba*, and quite as many of the *Q. tinctoria*. Of the former we have here one tree which produces *blue acorns*; but that is owing to a diseased state of the tree.—Many of the trees, in this old garden, are the identical trees figured and described by the Michauxs, (father and son,) and by F. Pursh, all of whom made this place their residence, while in this neighborhood.

Respectfully, yours,

ROBERT CARR,

Bartram Botanic Garden,
Philadelphia, Dec. 2, 1831.

CATALOGUE OF THE ACORNS

Of North American Oaks, sent from the Bartram Botanic Garden, near Philadelphia, to the Horticultural Society of London, Nov. 1831.

[The names are according to 'Pursh's Flora of North America']

1.	Quercus alba	White Oak.
2.	" phellos.	Willow Oak.
3.	" heterophylla.	Bartram Oak, of Michaux.
4.	" aquatica.	Water Oak.
5.	" nigra.	Barren Oak, or Black Jack.
6.	" "	A variety of do.
7.	" tinctoria.	Black Oak, or Quercitron.
8.	" "	A variety of do.
9.	" discolor, or	<i>Q. tinctoria sinuosa</i> , of Michaux.
10.	" "	A variety of do.
11.	" coccinea.	Scarlet Oak.
12.	" "	A variety of do.
13.	" rubra.	Red Oak, or Champaign Oak.
14.	" "	A variety of do.
15.	" falcata.	Spanish Oak; also called Red Oak in some of the Southern States.
16.	" "	A variety of do.
17.	" palustris.	Swamp Spanish, or Pin Oak.
18.	" "	A variety of do.
19.	" batinisteri.	Bear Oak, Black Scrub Oak, or Dwarf Red Oak.
20.	" obtusiloba.	Upland White Oak, Post Oak, or Iron Oak.
21.	" macrocarpa.	Over-cup White Oak.
22.	" lyrata.	Over-cup Oak, Swamp Post Oak, or Water White Oak.
23.	" montana.	Rock Chesnut Oak.
24.	" bicolor.	Swamp White Oak.
25.	" sericea.	(<i>Q. pumila</i> , of Michaux.) Running Oak.
26.	" chinquapin.	Dwarf Chesnut Oak.

Naturalisation.—Since the discovery of the New World, our English gardens have received 2,345 varieties of trees and plants from America, and upwards of 1,700 from the Cape of Good Hope, in addition to many thousand which have been brought from China, the East Indies, New Holland, various parts of Africa, Asia, and Europe, until the list of plants now cultivated in this country exceeds 120,000 varieties.—*London Atlas.*

Sheep in Vermont.—It is estimated that there are 766,803 sheep in Vermont. The several counties contain as follows:—Bennington 52,416, Windham 55,542, Rutland 139,996, Windsor 109,787, Addison 112,787, Orange 73,155, Chittenden 55,449, Washington 40,856, Caledonia 43,748, Franklin 41,638, Orleans 23,797, Essex 6,976, Grand Isle 8,656.

Agricultural.

ADDRESS.

DELIVERED BEFORE THE JEFFERSON COUNTY
AGRICULTURAL SOCIETY,
AT THE ANNUAL CATTLE SHOW AND FAIR, AT WATERTOWN,
SEPT. 27, 1831.

BY MAJOR EDMUND KIRBY.

GENTLEMEN—I congratulate you upon the auspicious return of our anniversary. Our meetings are always attended by agreeable associations. They bring in satisfactory review the past, and excite cheering anticipations of the future. But this perhaps, more than any former occasion, is calculated to inspire grateful emotions.

The labors of our society, through a succession of fourteen years, under the able guidance and mainly through the indefatigable efforts of our presiding officer, have been, in an eminent degree, crowned with success. A better system of agriculture; the introduction of improved breeds of cattle, and the cultivation of more intimate social relations among ourselves, are some of the fruits of these labors. And at no former period, since our organization, have the prospects of the farmer been so decidedly encouraging as at present. This favorable state of things must be ascribed to a combination of other causes with that just noticed.

We are blessed with a country admirably adapted to the pursuits of agriculture. Our climate is salubrious; our soil possesses a high degree of fertility; its productions are abundant and varied; our position enables us to resort, with the facility of water transport, to the New York or the Montreal markets, as either shall offer the highest inducements; above all, our great artery, the Black River, flowing through the centre of the county, presents for thirty miles a constant succession of water power, already becoming the favorite seat of the mechanic arts, and diffusing activity and vigor through our whole population.

With these great natural advantages, we should be wanting to ourselves if we were not a prosperous and a happy people. That we have not been entirely regardless of them, is manifested by all the circumstances of our condition. It is but about thirty years since the first inroads of cultivation were made upon the solitudes of the forest, and we have advanced to a population of fifty thousand souls. We already begin to enjoy the benefit of a home market from the various manufacturing establishments and flourishing villages, which are springing up in every part of the county. Many of our public edifices and private dwellings are constructed of the most durable materials, and in a style to do credit to a country older and more advanced in the arts and in wealth. The neat stone farm houses with which the county is studded at every point, impart an air of solid comfort, not surpassed in what have been regarded, as the more favored regions of our land.—Especially, it is believed, that the exports from the county of Jefferson, of the products of her own soil, are greater than those from any other county in the state. Other districts are distinguished for some leading staple, to the production of which, the farmer bends every effort. We happily combine, in a remarkable manner, the products of tillage with those of grazing, and send to market a large surplus of live stock as well as of grain.

A liberal support of public institutions, is the characteristic of a high-minded generous people:

and to deserve such a character, is a fair object of honorable ambition. It is a gratifying reflection, that the labors of this society have contributed in some degree, to acquire for Jefferson county a good name abroad. And could our farmers be made sensible of the respect which attaches to the county, from the circumstance of our association being so well sustained, I am confident, that they would to a man, contribute to our funds, and enable us by a more extended list of premiums, to reach all the objects of production.

But however well others may think of us, we must not conceal from ourselves, that we are yet but upon the threshold of improvement, and that the whole field lies expanded before us. Though much has been accomplished, still more remains to be done, demanding united efforts and the most persevering zeal.

While I offer a few suggestions upon some of the defects in our system, I am conscious that the contribution I shall be able to bring to the common stock, will be humble indeed; for, my life having been devoted to other pursuits, I have but a very limited experience to draw upon, and must make amends for my lack of knowledge, by the abundance of my zeal for the cause in which we are engaged.

A leading defect in our system is the occupation of farms too large for our means of cultivation. This arises from the cheapness of land and dearth of labor. How many of us grasp more land than we can manage to advantage, and how frequently are we seen toiling behind the proper season of our work, with every operation hurried, and not done properly, nor in its appropriate time. Seed is sown too late, upon ground imperfectly prepared; a feeble growth ensues, which comes forward struggling for the ascendancy with noxious weeds. In laying down to grass, we often practise the miserable economy of saving seed by not using one half enough; and to supply the consequent deficiency of fodder, resort is had to pasturing our meadows fall and spring. In a few years June grass and Blue grass predominate, and the crop becomes not worth the expense of harvesting; when we break up, to go through the same unproductive process. What farmer can thrive under such management? Most of you will say that this picture applies to my neighbor's farm, not mine. The exceptions are numerous and honorable; but is it not true, in some of its parts, of too many of us?

The remedy is simple and obvious. Let us limit our efforts to such a compass that we can till thoroughly all that we attempt to cultivate. Our toil will then become a pleasure; everything will be done appropriately, and an abundant harvest will crown the year with gladness.

To keep land dry, clean and rich, are fundamental principles, which if carried out fully into practice, will not fail to insure a constant succession of good crops. With slight exceptions, nature has provided us with the first of these requisites by the undulating surface of our soil. The second is to be attained by a diligent use of the plough and the hoe. As to the last, we have much to learn. The preparation and application of manure has occupied much of the attention of scientific cultivators in all ages and countries; and volumes are filled with details of experiments; upon the various methods of restoring to the soil the properties which we are constantly abstracting from it.

Our soil, originally covered by a rich vegetable mould, the accumulation of centuries and for a while yielding abundantly, even under the most imperfect cultivation, becomes, in process of time, partially exhausted by the severe and injudicious course to which it is frequently subjected. Relying upon its natural fertility, we have too much neglected the means, amply within our reach, of preserving its productive powers at their highest pitch. There are various modes of applying manure by which it may be made to contribute to the fertility of the soil; but it is of importance to know in what way the greatest good is to be derived. In regard to barn yard manure, almost the only kind in use among us, when applied as a top dressing to grass land, though the succeeding crop will be essentially benefited, yet much of its virtue is wasted by evaporation. It is unquestionably better to apply it on land under tillage. Until of late years it was not common to use it till thoroughly rotted; but numerous and critical experiments have established the fact, that more than half its fertilizing properties are thus lost; and it is agreed by the best modern authorities, that it should be hauled out and ploughed in before fermentation takes place, in order that the gases evolved by that process, may pervade the soil and impart to it their stimulating properties.

Wheat constitutes one of our most valuable products, affording under proper treatment, a sure and rich return for the labor of the husbandman. It forms a prominent object of cultivation upon almost every farm, and yet there is no crop in the management of which more ignorance, or negligence prevails. Our wheat ranks with the best in market; and it is an object of importance to preserve this character, for the difference of price between grain of first and that of inferior quality, is a handsome profit upon the whole operation of raising it.—But it must be confessed that the reputation of our county for wheat, suffers from the gross negligence of some, who sow foul seed in October and harvest weeds, chaff and smut in August.

In raising wheat, three things demand attention. The proper preparation of the ground; the selection of clean seed, and the sowing of it in good season.

Newly cleared land will yield good crops of wheat under almost any treatment; and with such the practice of letting it follow oats, peas, or corn will continue. But upon our older farms it will be found more profitable to discard fallow crops, and to prepare for wheat by a naked summer fallow, taking care to turn up the soil to the full depth of the plough, and to reduce it to a fine tilth.

In regard to seed, it is a law of nature that like begets like; and if you wish to harvest a crop of chaff, you cannot better insure one than by sowing it. I know it to be the settled opinion of many of you, that wheat, affected by the frosts of winter, or rains of spring, degenerates, and by some strange process of nature becomes chaff. Numerous facts have helped to give currency to this opinion. But men of science tell us that this is impossible, because chaff belongs to a different order of plants, and can no more grow from a grain of wheat than a pine tree can grow from an acorn. But whether this be true or not, it more nearly concerns us to know that chaff will vegetate and produce its kind. If we sow it therefore, we shall assuredly reap it. I have seen this pest come in where I know the seed wheat was

clean; but I ascribe it to chess having been brought on with the manure; or to its lying dormant in the ground; for it is ascertained that some seeds will lie in the ground for ages, and then vegetate when brought within the influence of the atmosphere.

We are not much troubled with smut, and with a little more attention to our seed should be still less so. The same law prevails in regard to it as with chess, it uniformly reproducing itself; and if seed entirely free from it cannot be procured, it should be steeped twenty-four hours in lime water, which will correct the evil.

In this climate, late sown wheat is peculiarly liable to be thrown out by the frost and winter killed, however well the ground may have been prepared for its reception. According to my limited experience, the proper time for sowing, is from the middle to the last of August.—The operation should be closed with the Roller, an implement which is fast coming into general use and furnishes its own recommendation. It is especially useful where seeding down to grass, for it leaves the surface smooth for the scythe: but it is of great service in sowing all small grain, by breaking the lumps to pieces, and pressing the earth around the seed, causing it to vegetate more certainly and more evenly.

The advantages of early sowing are these. The plant becomes well rooted, and acquires sufficient strength to resist the frosts of fall and spring; which are so apt to heave out and destroy the feeble plants of late sowings. In the spring, it is prepared to make vigorous offsets and comes forward rapidly, unaffected by the draughts, which sometimes prevail at that season, and occupies the ground to the exclusion of weeds and noxious plants.

A rotation of crops, resting upon a basis of wheat and grass, filling up one or two intermediate years with spring grain, such as corn, oats, barley or peas, will keep our old farms in good condition; and combined with a well selected stock of sheep, and neat cattle, will bring them to high point of productiveness.

In farming, whatever is worth doing at all is worth doing well.—This maxim applies especially, to the selection of stock. It is as easy to raise a colt of high blood, as it is an inferior one, and at four years old, the former will be worth twice as much as the latter.

Efforts are making by several members of the society, to introduce the improved breeds of neat cattle. Our pens today, exhibit specimens of both the Devonshire and short horn Durham breeds, crossed upon our common stock, from various parts of the country. We have also the gratification, through the liberality and enterprise of Messrs Bostwick and Buck, and several other gentlemen of Lowville, of a fine display of the full blood Durham cattle, which have been introduced by the former gentleman into Lewis county, from the celebrated collection of Colonel Povel at Philadelphia, and an opportunity is afforded us of thus realizing one of the important benefits of our society, of comparing these two breeds of cattle with each other, and both with our common stock. No man, I think, can be at a loss which to prefer. So far as I am informed, wherever the short horn Durhams have been introduced, they have challenged competition, and been pronounced superior for draft, for the dairy, and for the butcher. Our long nourished prejudice is in fa-

vor of red cattle; but it will yield, when the superior excellence of the Durham breed becomes more generally known; and we shall no longer consider white marks as a blemish.

Some are so blinded by prejudice, that they ascribe the acknowledged superiority of the improved breeds of cattle, solely to the greater care and attention bestowed upon them. Admitting this to be the case, and that they are, intrinsically, no better than the common breed, yet if from fancying them so, we can be thus easily misled to bestow such attention, in fitting them for market, as to make them at three years old, bring the price that our present stock does at four, which I believe will be the case, it is a sufficient reason for incurring the expense of their introduction. But in truth, there is as marked a difference between them and the original stock of the country, as there is between the ungainly prairie hog, and the compact grass breed, which is rapidly supplanting it in all parts of the country. It is asserted that the same difference exists in the expense of keeping them, as between these last animals; that the Durhams in particular, are comparatively small eaters, and take on fat more readily than any other cattle.

One of the most serious evils to which the farmer is exposed, is the fluctuation of the market for the products of his labor. This will ever be the case while we are dependent for the disposal of our surplus, upon the policy or the wants of foreign countries. A steady market, at remunerating prices, is all we ask, and this, in regard to one of our most valuable staples, we have now a right to count upon.

Protecting duties upon wool and its manufactures have stood the test of experience. Both the wool grower and the manufacturer, are prospering under them, while they operate injuriously upon no part of the country, nor upon any class of community, inasmuch as the fabrics of wool can be purchased at lower prices than they could before these duties were imposed.* Having been adopted deliberately, and operating beneficially, we may regard them as part of the settled policy of the country.

The domestic supply of wool is yet below the demand, and notwithstanding the high duties, large importations are constantly made. These will continue several years, insuring to the wool grower a liberal price. But when a full supply shall be produced in the country, and importations cease, competition will regulate production, and it will continue to bear a fair price.

There is no part of the country better adapted to the raising of sheep than this. From the best information, it appears that our sheep winter as well, or better than they do in any of the extensive wool growing countries. The destructive maladies, which sometimes sweep off whole flocks in Europe, are unknown among us. There is no stock that multiplies more rapidly than this, and

*A bale of coarse woollen cloths was recently imported into Charleston, S. C. from England, and the payment of the duties refused, for the purpose of testing the constitutionality of a protecting tariff, before the legal tribunal.

It is stated in a Charleston paper, that the actual cost of that cloth, including freight, insurance, exchange &c., but exclusive of duties, was sixtytwo cents per yard. It was sold at Charleston, 'AT THE FAIR MARKET VALUE,' for sixtyeight cents per yard. From which it would appear, that the domestic manufacture of such goods, has so reduced the market price, that the foreign article cannot be imported, EVEN FREE OF DUTY, and yield a reasonable profit.

none more readily reduced. We may bear in mind also, that no other stock is better calculated to promote the fertility of the soil. Everything then invites attention to this branch of husbandry, and no farm should be without a flock of fine woolled sheep.

Of the various breeds of sheep to be found in the country, the Saxon is in highest repute, and its wool brings the highest price in market. The extensive importations of Saxon sheep, during the last few years, place them within the reach of every farmer, and bunks of full blood, and of every grade of mixture, may be procured without going out of the country. These animals thrive in our climate without any extraordinary attention, and crossed with our common sheep, much of the fine fleece of the Saxony, is combined with the larger and more vigorous carcass of our native breed.

To be concluded next week.

We have gathered a few scraps which were used at New York. There can be no harm in showing them in advance of long reports; and among these is one which refers to the effect of the tariff on iron manufactured in the west. The prices referred to are at Pittsburgh.

In 1828, bar iron sold for	\$196 a \$210 per ton.
Now the price is	100
In 1828, boiler iron was	350 per ton.
Now it is	140

In 1828, sheet iron was scarcely in the western market—value at	18
---	----

Now it is manufactured in Pittsburgh, sufficient for the valley of the Ohio, at	8 50
---	------

In 1815 a 1820, cut nails were valued at	14 a 15
--	---------

Now the same kind sells for	6 a 7
Hoop iron in 1828 was worth	250
Now it sells for	120
Axes in 1820 were worth	24
Now they sell for	12

Scythes are now fifty per cent lower than in 1824.

In 1820, iron hoes ground sold for	9
------------------------------------	---

Now steel hoes ground are worth	4 a 4½
---------------------------------	--------

The same remarks apply to spades and shovels; and socket shovels sell now for 4½, which in 1820 were worth 12.

English vices in 1820 were worth	20 a 22
----------------------------------	---------

A better article is now made in this country, at	104
--	-----

The same article in 1824 sold for	18½
-----------------------------------	-----

Braziers' rods (imported) in 1824 sold for 14 per lb. now our manufacturers supply them at 130 per ton, ¾ to ¾ inch in diameter.

Within the last 8 years there have been erected 12 new furnaces in Kentucky near the Ohio.

6 on the Alleghany,	
4 on the Monongahela,	
21 in west Pennsylvania,	
8 rolling mills in Pittsburgh.	

Steam engines are now fifty per cent lower than in 1820.

Within the last year, more than 100 steam engines have been made in Pittsburgh, and it is thought that upwards of 150 will be finished in 1832.

Some other items may hereafter form another collection, that will go to strengthen arguments.—U. S. Gazette.

John Randolph, of Roanoke, advertises in the Nat. Intelligencer, his whole collection of horses for sale—terms low, and any credit given on good security, the owner having no further use for them.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, DEC. 7, 1831.

SHOW OF BUTTER AND CHEESE.

Yesterday was the day assigned for the Exhibition of Butter and Cheese, at Faneuil Hall, for the liberal premiums offered by several gentlemen of Boston, and by the Massachusetts Agricultural Society. About 60 lots were presented from various parts of New England; the quality of the butter was considered generally superior to that of last year.

The following award has just been announced by E. HERSEY DERRY, Esq. Chairman of the Committee:—

PREMIUMS ON BUTTER.

- 1st premium of \$100 to Luther Chamberlain of Westborough, Mass.
 2d ditto of \$50 to Henry Sprague of the Boylston Farm, Princeton, Mass.
 3d ditto of \$30 to Seth Davenport of Mendon, Mass.
 4th ditto of \$20 to Samuel Sawyer, 2d, of Sterling, Mass.
 5th ditto of \$15 to Gabriel Parker of Westboro, Mass.
 6th ditto of \$10 to Mrs Lydia Page of Haverhill, Mass.

PREMIUMS ON OLD CHEESE.

- 1st premium of \$100 to Ebenezer Tidd of New Braintree, Mass.
 2d ditto of \$50 to John Matthews of New Braintree, Ms.

ON NEW CHEESE.

- 1st premium of \$50 to Roswell Converse of New Braintree, Mass.
 2d ditto of \$30 to David Lee of Barre, Mass.

We shall next week publish the Report of the Committee, with a particular account of the names and residences of the competitors, &c.

FARMER'S WORK FOR DECEMBER.

The farmer should obtain his year's stock of fuel as early in the season as possible, and before the depth of snow in the woodlands renders it difficult to traverse them by a team. It would be better for farmers, generally speaking, where wood is not cheap and plenty, to use the saw instead of the axe in preparing wood for the fire. It is said that a fire composed of billets of wood, not more than 14 inches long, will give more than two thirds as much heat into a room as that made of wood of double the length; and that billets of from 3 to 4 inches in diameter, on a medium will be found most economical.

A valuable paper, by the Hon. J. Welles, originally published in the Mass. Agr. Repository, recommends cutting hard wood trees between 40 and 50 years of age, and the writer states that 'though trees may shoot up in height by standing longer, yet the period of the most rapid vegetation is mostly over and by this means much of the under growth is destroyed.' Mr Welles is of opinion that in cutting over a wood lot to obtain fuel it is best to take the whole growth as you proceed. He observes that 'we have been condemned as evincing a want of taste in cutting off our forests without leaving what it would take half a century to produce, a shade near where it is proposed to erect buildings. The fact is that trees of original growth have their roots mostly in the upper stratum of earth, and near the surface. A tree acts upon its roots, and is acted upon by the wind, sustaining in common with the whole forest the force of this element, and it becomes accommodated or naturalized to this pressure. But when left alone or unsustained, it is borne down by the first gale, often to the injury of property and even of life.' The Farmer's Assistant likewise says 'if woods are old and decaying the better way is to cut all off,

as you want to use the wood and let an entire new growth start up which will grow more rapidly.'

PLANTING FRUIT SEEDS.

MR FESSENDEN—Your correspondent M. of Maine, asks for information respecting the proper course to pursue in planting fruit seeds and stones. You have assigned sundry reasons for their failure, but the true one I apprehend has not been stated. From long experience on this subject I have found that the action of a severe winter frost is essential to their vegetation. If this doctrine be correct, the depth of snow remaining through the winter on ground not previously frozen, as was the case here, and probably in Maine, was a sufficient cause for the failure. Whether the action of frost in itself conduces to the vegetation of this kind of fruit, or whether it only facilitates it by preparing the envelope to give way to the imprisoned seed in its efforts to obtain heat and light, which are essential, are questions which I cannot with confidence determine. I have cracked stones that had been secured from frost and planted them in the spring, when no vegetation ensued. Perhaps they had been kept too dry. I intend to renew the experiment with some I have reserved for the purpose in a moist cellar. In planting fruit seeds and stones, my custom has been to excavate the surface, and to throw the stones into the cavity when the earth is moist, and cover it with a board, or what I have found better, to put them into some shallow vessel level with the surface and cover it with a thin sod. After preparing my ground in the spring I crack the stones, and lightly cover them in trenches. On account of the great prevalence of the wire worm I have some seasons omitted to crack the stones, that the seed might be longer protected by the shell. Not a dozen where I expected thousands made their appearance, in this case, last spring. After a frosty winter, I have not found it useful to disturb the shell. This failure I consider a suspension only, with but the loss of one year's growth, as we may calculate from present appearances that there will be frost sufficient before next spring to open the shell.

For a few years past I have adopted an additional method. After saving the stones from the fruit consumed, for the purpose of planting, as above mentioned, (Dr Darwin's pulp I consider of no use) I tread into the earth what remains under the tree. These stones I find will vegetate from ten to fifteen days sooner than those otherwise managed, and become much larger and more vigorous. When the stem is a little hardened I take them up with a trowel and transplant them in the nursery. I am now mostly dependent on the birds for my mazzard cherry stocks. Two years ago they furnished me with two thousand trees which grow two feet in height the first season, and furnished trees sufficiently large for budding.

Respectfully your friend and servant,
 Worcester, Nov. 28, 1831. O. FISK.

WINTER WHEAT.

MR FESSENDEN—Having seen your notice of the receipt of a quantity of the Black Sea White Flax wheat, and feeling desirous of promoting the cultivation of this very valuable grain, I can state for the information and encouragement of those farmers who may have doubts of its success in New England, that it has been raised here

every season since 1827, the yield varying from 20 to 28 bushels per acre. It has been twice sown on an old plain (the soil of which is a fine gravel) which has been under cultivation more than 100 years.—The soil of the field in which I raised it last season is a light loam.—From what I have seen of this wheat I am satisfied that it is a more certain crop than rye.—It has been raised by several of my neighbors and I have never known an instance of its blighting. I have found it necessary to manure more highly where I sow wheat than where I raise rye.

PLANTING PEACH STONES &c.

A correspondent in the last New England Farmer wishes to be informed of the best method of planting the peach and other fruit stones, and as we are all prone to think our own mode best, I take the liberty of stating mine. I take a box in the fall, throw in a little earth and place such stones as I wish to plant on it—then fill the box with earth and place it in an exposed situation and let it remain until I plant my garden, when I empty my box and collect the stones and crack them; take out the meats and plant them in rows 2 or 3 inches deep. If your correspondent will try this method I believe he will find it a good one, if not the best.

Yours &c,

E. A. E.

Killingworth, Con. Nov. 29, 1831.

PARMENTIER'S HORTICULTURAL GARDEN FOR SALE.

We understand that Madam Parmentier finding it inconvenient to carry on the Horticultural Botanic Garden at Brooklyn, has determined to dispose of it. This offers a fine opportunity for a person disposed to enter upon that business. The establishment contains about fourteen acres of ground, inclosed by a very high stone wall laid in lime mortar, and is situated at the junctions of two of the most public turnpikes on Long Island, within two miles of New York. The stock of saleable trees consists of 13,726 Forest Trees, 10,616 Grape vines, 10,000 Pear trees, 3,000 Cherry trees, 6,200 Apple trees, 1,621 Quince trees, 600 Plum trees, 361 Apricot trees, 2,460 Peach trees, 2,100 Mulberry trees, and 6,300 Shrubs, exclusive of the trees in the alleys and borders, Rose bushes and seedlings. We are not informed as to the terms on which the establishment is to be sold. We regret that any circumstance should render it necessary for Madam Parmentier to dispose of the establishment. The recent death, however, of her son, on whom she so much relied to take charge of it, seems to have influenced her determination. The late Mr Parmentier expended an immense amount of money on the place, besides several years of hard and incessant toil, and we know it to have been his most anxious desire that his family should keep possession of it. But he did not foresee the melancholy change that was so soon to take place. If any female is qualified to carry on such an establishment, then is Mrs Parmentier—assisted as she is by one of the most intelligent and active young ladies (her daughter,) we ever met with. But all who have such concerns, even of small extent, know the hopelessness of being able to get assistants who will take that peculiar care so indispensable to success. Mrs Parmentier and her daughter are well qualified to manage the whole concern so far as females can be; but then there are thousands of instances requiring the eye of the proprietor which females

cannot supply. We shall endeavor to obtain the terms of sale, and will render all the assistance in our power both to Madam Parmentier and those wishing further information on the subject.—*An Farmer.*

Boston.—If no unfavorable political or other event occurs the next Spring and Summer will exhibit scenes of uncommon activity and prosperity in and near Boston. Ten stores are to be built on the City wharf—a block of stores is to be erected on Kilby street—Commercial street is to be extended 1200 feet, and built upon probably—the works for the terminus of the Lowell Rail Road will be prepared, and the making of the Road will be commenced and prosecuted with spirit—Tremont street will be extended towards Roxbury—and undoubtedly numerous individuals intend to erect houses and stores, and are maturing their plans.

Besides the above enterprises some of the preparatory labor on the Providence, Taunton and Worcester Rail Roads may be expected to be commenced the next season.—*Boston Centinel.*

The first year of travelling on the Liverpool and Manchester railway has expired—during a part of the time, however, there was not full accommodation for either passengers or goods, yet it seems that 416,000 persons have travelled its whole distance, and about 34,000 persons short distances—a total of 450,000—and whose fares reach 99,000, stg.—a prodigious sum. The exact sum produced by the carriage of goods is not ascertained, but it is estimated at 90,000. This is surely a convincing proof of the utility of Rail Roads, and the favor with which they are regarded by the community. In this country we have no doubt they will prove as profitable and popular.

The Glasgow and Grankirk railway was formally opened at the end of September. The locomotive engines performed their journeys in capital style, conveying elegant carriages and barouches filled with passengers at the rate of 20 miles an hour. It presented another splendid triumph of science and art.

Wool.—We have been furnished with a statement showing the number of pounds of wool, that have been imported into Boston during the years 1829, 1830, and the 1st, 2d, and 3d quarters of this year.

	Pounds.
Imported in the year 1829,	707,242
Do. do. do. 1830,	424,589
Imported in the 1st, 2d and 3d quarters of this year,	2,491,846

Boston States.

Peruvian Cotton.—We have seen a specimen of the Peruvian cotton recently imported at Boston from the Pacific. The quantity imported is nearly 400 bales, or 60,000 pounds, and it cost in the country of its growth only one cent a pound. The loss of weight in ginning is about 60 per cent. The plant from which it is obtained, we are informed, is a tree, which grows spontaneously in the western parts of South America.—*A. Y. Ad.*

American Manufactures.—The Methuen Company manufacture Pickings, Drillings, and Sheetings; the quantity made is one million one hundred and thirty-seven thousand two hundred yards, viz: 517,200 yards of Drillings and Tickings, and 590,000 yards of Sheetings. The hydraulic power is derived from a fall of 40 feet, operating on a water wheel of one hundred and eight feet in circumference, by 14 feet wide, which is said to be the largest wheel of the kind in North America, and probably the largest in any country.

Cyphering Slates.—At Delaware Water Gap, 20 miles above Easton, in Bucks county, (Penn.) where the rocks are piled up 1200 feet high, James M. Porter has a manufactory of Cyphering Slates operating by water power. They are smoothed, framed ready for sale, superior to imported ones, each in two minutes. Last year it made 4200 doz. slates, and will finish 5000 dozen the present year.

Culture of the Vine in Pennsylvania.—A gentleman near Harrisburgh is said to have made this year, from the produce of a vineyard, planted four years ago, and occupying only 3 acres, 18 barrels of wine, worth \$20 each.

Broom Corn Seed has been sold in Northampton from 17 to 25 cents per bushel. The opinions of farmers vary much as to the value of this article. More than 50,000 bushels were raised in this vicinity the past season.

'Proceeding the whole Pork'—Mr Thomas Clapham, of Portsmouth, N. H. killed a Hog a few days since, thirteen months and thirteen days old, weighing, when nicely dressed, 532 lbs. When he bought him he was one month and thirteen days old, and weighed 30 lbs.—gaining in one year, 502 lbs.

A tavern near the London Fish Market, (Billingsgate) is a-seated to sell upwards of 4000 glasses of gin, between 4 and 8 A. M. many of the fish-women and porters consuming 10 to 12 glasses before breakfast.

Liverpool salt has been found very injurious to butter, which it makes soft, gummy and rancid. Near Liverpool it is not used for preserving butter, beef or pork, but only for culinary purposes. Turks Island salt, washed, dried, and ground in a clean mill, is the best for butter.

NOTICE.

A stated meeting of the Massachusetts Horticultural Society will be held on Saturday next, at the Rooms of the Society, at 11 o'clock, A. M.

R. L. EMMONS, Secretary.

Pear Seeds.

For sale at the Seed Store connected with the New England Farmer Office—One bushel of fresh Pear Seeds, of excellent quality. Nov. 30.

Mackay Pigs.

For sale, 10 first-rate pigs, of the genuine Mackay breed. They are about six weeks old, of good size and fine form. Inquire at the N. E. Farmer Office.

Flooring Boards, &c.

Of hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr, 65, Broad street.

Seeds for Country Dealers.

Traders in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed that they can be furnished at the New England Farmer Office, No. 50 1/2 North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as they can be procured in this country, neatly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and SWEET CORN, &c. of different sorts.

THE seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves. Nov. 12.

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c, &c, which he will dispose of at as low a rate as can be purchased in the city. Watches repaired and warranted.

BRIGHTON MARKET.—Monday, Dec. 5.

[Reported for the Chronicle and Patriot.]

At market, this day, 1470 Beef Cattle, 162 Stores, 1220 Sheep, and 1210 Swine. About 70 Beef Cattle, 400 Sheep, and 600 Swine have been before reported.

PRICES.—Beef Cattle—Market quick at an advance, say for barrelling Cattle 25c. per hundred; better qualities not so much. We quote for extra \$5 25, prime 4 83 a 5, good 4 50 a 4 83, thin 3 25 a 4 50.

Barrelling Cattle—Mess 4 25, quick; No. 1, 3 75.

Stores—High prices are asked—very few sales.

Cows and Calves—A few sales but no prices noticed.

Sheep—Prices did not vary much from last week—we noticed sales at 1 75, 1 88, 1 90, 2 25, 2 50, and \$3—some wethers were included.

Swine—No sales effected.

New York Cattle Market, Dec. 2.—In market this week 800 head of beef cattle, a short supply. First rate cattle are very scarce, and worth \$6.75; inferior from \$4.50 a 6. Sheep and lambs in great demand, very few in market; prices have averaged considerably higher, full 50c. a head on sheep. Sheep are worth from \$3 a 5, and numbers that were fine sold at \$6; lambs 2.25 a 3.25. Dressed pork, sales brisk at 4.75 a 5.25. Good cows and calves are in demand.—*Daily Ad.*

IN the New York market only the quarters of Beef are weighed, the hide and rough tallow being included without weighing. At Brighton, the hide and tallow are weighed as well as the quarters.

MISCELLANY.

The following extracts are from a small pamphlet lately published by Lily & Ward, and Carter & Reader, entitled

KNOWLEDGE FOR THE PEOPLE.

OR, THE PLAIN

WHY AND BECAUSE.

Why does a silver, or metal tea-pot, when filled a second time, produce worse tea than the earthenware vessel?

Because the heat retained by the silver, or metal vessel, so far exhausts the herb, when the water is first poured in, as to leave very little soluble substance for a second infusion; whereas, the reduced temperature of the water in the earthenware pot, by extracting only a small portion at first, leaves some soluble matter for a second infusion.

Why is it advisable to pour boiling water into the tea pot before the tea is made?

Because the vessel being previously warm, may abstract less heat from the mixture, and thus admit a more powerful action.

Why is it recommended to add only a small quantity of boiling water at first?

Because only the water immediately in contact with the herb can act upon it; and it cools very rapidly; especially in earthenware vessels: it is therefore clear that the effect will be stronger where the heat is kept up by additions of boiling water, than where the vessel is filled at once, and the fluid suffered gradually to cool.

Why is a strong infusion of green tea an effectual poison for flies?

Because of the prussic acid it contains.

Why is coffee so seldom well made in England?

Because, 1st. The berries are over-roasted, their proper color being that of cinnamon; 2d. The coffee is ground too fine; 3. Not enough coffee is used; 4th. It is usually overboiled, by which means the bitter principle is extracted from the berries.

Why are we in some measure indebted to the French for our present abundant supply of coffee?

Because all the coffee grown in the West Indies has sprung from two plants taken thither by a French botanist from the botanic garden at Paris. On the voyage the supply of water became nearly exhausted; but so anxious was the Frenchman to preserve the plants, that he deprived himself of his allowance in order to water the coffee plants. Formerly coffee could only be got at a great expense from Mocha in Arabia.

Why do foxes, if kept confined, lay their eggs without shells?

Because they cannot then get at any earth which contains the material requisite for the shell. Dr Paris, in the *Linnaean Transactions* shows that if the legs of hens be broken, they will by their eggs without shells until the fracture is repaired; nature employing all the time in circulation for the purpose of reuniting the bones.

Why are certain small foxes called 'bantams'?

Because they were first introduced here from Bantam in the Isle of Java, in the year 1683.

Why are eggs preserved by rubbing them with butter?

Because the butter closes the pores in the shell, by which the communication of the embryo with external air takes place. The embryo is not however, thus killed. Varnish has a similar effect. Reanour covered eggs with spirit varnish, and found them capable of producing chickens after two years, when the varnish was carefully removed.

Why is the coloring of cheese unobjectionable, provided it is genuine?

Because the seed, or morita, by which the coloring is produced, is slightly purgative and stomachic. It is produced by a bush, or small tree, mostly tropical.

Why have white veils a tendency to promote sun-burn and freckles?

Because they increase the power of the sun's light.

Why are white hats and dresses worn in summer?

Because dark colors absorb most heat; white therefore, reflects most heat, and is cooler wear. A white dress in winter is good, because it radiates or receives little heat. Polar animals have generally light furs. White horses are both less heated in the sun, and less chilled in winter, than those of darker hues.

Why does a flannel covering keep a man warm in winter, and ice from melting in summer?

Because it both prevents the passage of heat from the man, and to the ice.

Why does a person with a cold in the head or catarrh from the eyes and nose, experience so much more relief on applying to the face a linen or cambric handkerchief than one of cotton?

Because the linen, by conducting, readily absorbs the heat and diminishes the inflammation, while the latter, by refusing to give passage to the heat, increases the temperature and the pain. Popular prejudice has held that there was a poison in cotton. —*Frædell.*

Why is cotton warmer than any other fibrous thread?

Because the fibres of cotton, when examined by the microscope, will be seen to be finely toothed: this explains the cause of their adhering together with greater facility than the fibres of other species which are destitute of teeth, and which cannot be spun into thread without an admixture of cotton.

Why does oiled silk, or other air-tight covering, laid on a bed, preserve greater warmth than an additional blanket or more?

Because the oiled silk prevents the ventilation of the person by the slow passage of air, as through the texture of the blanket.

Why does worsted differ from yarn?

Because separate threads of wool are more twisted for the worsted, of which stockings and stuffs are made, than for the yarn, of which blankets, carpets, &c. are made. Worsted is named from its being originally manufactured in great quantities at Worsted in Norfolk, once a large town, but now reduced to a village; the manufacture being removed to Norwich and its vicinity.

Why is woollen cloth advantageous?

Because of the readiness with which it allows the perspiration to escape through its texture, its power of preserving warmth to the skin under all circumstances, the difficulty of making it wet through, the slowness with which it conducts heat and the softness, lightness, and pliancy of its texture.

Why are blankets so called?

Because they were first made in 1340, by one Thomas Blanket, and some other inhabitants of Bristol.

Why do pearl-ash and water remove grease spots?

Because the pearl-ash unites chemically with the grease, forming a species of soap, which easily washes out.

Why is pipe-clay used for scouring cloth?

Because pure clay, or alumina, has great affinity for greasy substances.

The Yankees.—One man at Charlestown, Massachusetts, has gathered 352 lbs. of squashes from one seed—another at Portsmouth plucked an apple from one of his trees that weighed 1 lb. 10 oz.—and the core of a third dexterously shook a quince tree, and eat a peck of golden fruit! A fourth makes about 2400 dollars a year by the manufacture of shaving boxes to assist the operation of multiplying the beards of southern gentlemen—a fifth grows water-melons weighing 30 lbs. So they go on. With anything—from a shaving box to a ship, from contriving wooden nutmegs to the use of the bayonet—from making cider to handling 22-pounders, the Yankee always wishes to 'go ahead'; and he will sit down, with a penknife, to make a clock out of cedar shingles—or enter for a three years' voyage to the Pacific to harpoon whales—just as it happens! Two of them some years ago, took a trip to Canton in an old sloop, in which they built an oven and commenced the manufacture of gingerbread; and, having gathered money, returned with a 'considerable' cargo of teas, which they picked up 'in trade.' And one who had recently, peradventure, returned from a voyage among the frozen islands of the south to catch seal—lately managed a team of one hundred and fifty pairs of oxen at a cattle show, marching and countermarching them like a well drilled company of soldiers, at command! We may next hear of him teaching a school, or hammering horse shoes, building a mill, weaving cotton table cloths, or making mouse traps! His only motto is 'ONWARD'—always onward.—*Niles' Register.*

Progress of Refinement.—A Philadelphia Editor has modified the vulgar and hackneyed expression, 'Going the whole Hog?' by substituting the following more polite and genteel words.—'Proceeding the whole Pork!'

Cobb's Treatise on Silk.

Just published, and for sale at the Agricultural Warehouse and Seed Store, No 503 North Market street, A Manual, containing information respecting the Growth of the Mulberry Tree, with suitable Directions for the Culture of Silk.—In three parts—with colored engravings. By J. H. COBB, A. M. Published by direction of His Excellency Gov. Lincoln, agreeably to a Resolve of the Legislature of Massachusetts. Price 37 1/2 cents. Oct. 26.

Ammunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned Jan. 1

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer's office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

COMMUNICATIONS.

ANTIDOTE TO THE POISON OF CHERRY LEAVES.

Junius Plam, Dec. 9, 1831.

MR FESSENDEN—In consequence of the note in your paper of 5th October, relative to the poisoning of sheep by eating the leaves of wild cherry trees, on the 19th of same month I put a note in your paper hoping to have procured further information on the subject. Not obtaining as I had hoped, I was induced to address a letter to S. M. Tully, Esq. of Saybrook, Connecticut. I have this day received an answer, which I now inclose you for publication in the next New England Farmer, as I think it calculated to do much good. It convinces me that I have suffered the loss of very many sheep and lambs for several years past without knowing the cause.—My pasturage is high and dry, and rocky, and being an island they have water at command; round the borders is a belt of wood, and in it very many of the wild red and black cherry trees, large and small, on which I have now no doubt they have eaten at pleasure—and probably by eating little at a time in passing a small plant of it, the disease may have been a long time in their system without causing a speedy death as described by Mr T. The eating his large tree gave a large quantity of feed on a sudden, of which it appeared his sheep ate greedily, causing a sudden death. I have directed every wild cherry tree and bush to be cut down while without leaves and carefully watched to prevent a further growth, and hope to derive benefit from it.—It should another year I will let you know it, as I know of no other plant which could have caused the damage we have experienced. I wish some of your medical subscribers would let us know if my conjecture is correct, that a sheep may eat a little at a time of a poisonous plant, and have the poison some time in their system before death ensues.

Yours respectfully, JOHN PRINCE.

Saybrook, Conn. December, 5, 1831.

JOHN PRINCE, ESQ.

SIR—I received a line from you a few days since respecting a notice that appeared in a public print this fall some time, with my signature, in relation to the poisonous qualities of the wild cherry, and should have paid earlier attention to your request, but have been prevented through a multiplicity of engagements; but I now hasten to give you all the information in my power.

A few years since I had 16 or 18 sheep that had access to a wild cherry tree that had been felled some time in the forenoon; they ate of the wilted leaves, which I was ignorant of, until one or two hours after, when I discovered that they were sick, and soon ascertained the cause; two or three of them died in 20 or 30 minutes after I first observed that they were sick, and others appeared to be in the agonies of death, when Capt. Noah Scovill, a gentleman residing in the next village, who happened to be then passing by, and seeing the situation of the sheep, recommended the plantain as a speedy cure. I applied it according to his direction, to some that were apparently but

just alive and they were almost instantly relieved and to the best of my remembrance nearly cured in 4 or 5 hours; others more slightly affected seemed to be well in one or two hours after the plantain was used. The recipe was this—take a handful of the leaves of the common plantain, bruise them and pour on a little hot water, squeeze it through a cloth, add a little cold water that it may not scald the animal, and it may be given immediately; less than half a pint is a sufficient dose for a sheep. As I do not recollect ever having seen a bullock poisoned in consequence of eating cherry leaves, I cannot speak with confidence of the plantain, as an anti-lye, but have no doubt that it would be as useful for neat cattle as for sheep. I am aware that some of our botanists and physicians think that the plantain possesses no medicinal property whatever; but that it operated as an antidote against poison, or a corrector of the stomach in the case above referred to, is, I think, placed beyond a doubt, as it can be substantiated by the testimony of 4 or 5 adults now in my family, and several of the neighbors, whose veracity, where they are known, cannot be questioned; neither can there be any doubt, in the case I have described, but that my sheep were poisoned with wild cherry leaves, as they were seen by some of the neighbors, eating leaves from the tree that had been felled, and they could certainly get nothing else at all hurtful; in addition to this, I caused one or two of those that had died to be opened, and found the leaves in the stomach, though in small quantities; I should think but a small handful in each.

As to appearances of the disease, in sheep, I should think there was something a little peculiar at first, the ears drooping, panting with the mouth open, and tongue considerably out, trembling, staggering, falling, convulsion, and death soon following. I believe in most cases the poison of cherry leaves operates in 3 or 4 hours.

In this part of Connecticut, the wild cherry, to use the popular name (the botanical name I do not now recollect) is that which produces the fruit for making cherry rum, and in our forests grows to a large size; it is not however so abundant, as walnut, oak, chesnut, birch or maple, but is about as common as ash, beech, elm, &c; when grown into large trees and cut, they seldom grow from the root; but if cut when small, they shoot abundantly, indeed it is difficult to subdue them; where there are but few, a little salt, or brine, will effectually destroy them, as it will all vegetation; but this expedient would be both tedious and expensive. The wild cherry is more common in our cultivated fields than in the forest: its growth is more rapid, it is more fruitful, and there are more birds to scatter the seeds; from this circumstance, they generally shoot up by the fences, where the grass and weeds are not kept down.

Many of our farmers consider the wild cherry nearly as hurtful to English grain in producing blast, as the barberry, and I am almost certain that its shade is more injurious to any crop, than that of any other tree.

A writer in one of the New Haven papers (I do not now recollect which) some time in the summer past, observes, that the wild cherry is not injuri-

ous to cattle or sheep, when dry, or green, but only when in a wilted state; whether this is a fact that may be relied on I am not able to say, but apprehend they are most hurtful when in a wilted state, as I have often seen cattle cut of it when green without any apparent injury.

It is several years since I have been obliged to use the recipe above described and though it has been in my possession some time, I did not make it known to the public through the medium of the press, as I supposed it to be in common use, but any service that I can render an individual, or the public, in this way, will be done with cheerfulness.

With sentiments of esteem, I remain,
Sincerely your friend and servant,

SAMUEL M. TULLY.

P. S. In respect to the raising of sheep, I would remark that the farmers in this vicinity consider high and rocky land the best for sheep; the pasture is more sweet, and nutritious and the air more pure and healthy.

Remarks by the Editor.—The foregoing papers are very interesting, and important, and the writers have laid us under great obligations, and we think, greatly benefitted the public by their communication. If any of our medical friends, or others can give information on this subject we shall receive it with gratitude and give it an immediate insertion in our paper.

HEATING HOT HOUSES.

MR FESSENDEN—When, and where, were the opinions published upon which Mr Perkins' ingenious and elaborate commentary was written which appeared in your last No. 2? If not printed, to whom were they addressed? Did Mr Perkins publish the whole or only part, and if part, was that part given in his own words, or in the words of the writer? Was it a criticism of Mr Perkins' own plan, or of some other? I ask this, because, at the outset Mr Perkins treats it as a critique on his own works, and in a tone of anxiety. Yet afterwards, it would seem to have been a criticism on a different plan, because it speaks of two upper pipes, which I presume from his own description Mr T. H. Perkins' apparatus has not.

Is it not possible, that Mr Perkins has misconceived or misapprehended the writer whom he answers? The reason I ask this is, that in the very brief view he gives of the writer's objections, it is plain, that he has sometimes misunderstood him, and he may have so done in other cases. I select a very important one. Mr Perkins represents the unknown writer as objecting to his plan of inserting the upper pipe 3 inches below the top of the boiler. To this objection Mr Perkins replies, that this is necessary, because otherwise the water would overflow. Now it is plain that Mr Perkins did not perceive the force of the objection.

The objection was made to this very defect of the boiler, which required such a waste of metal, space, and heat.

If Mr Perkins will reexamine the sketches of the new boilers in Tredgold's and Mearns' articles in Loudon's Gardener's Magazine, he will see that they are close boilers, and the upper pipe is insert-

ed at the top. The pipes and boiler are always entirely full. When therefore heat is applied to the boiler, the water having no room to expand within the boiler is forced along the pipe by the expansive force of the increasing volume, and rises in the reservoir instead of the boiler. Boilers on this principle existed with me before the publication of Tredgold's essay, and the advantages are obvious and great.

I could point out some other opinions which I think erroneous into which Mr Perkins has fallen, as to smoke flues, and the passage of water in a lower pipe of half the size of the upper, but it is obvious, that he has no confidence in his own opinions on this last point, or he would have spared the expense of his heavy lower pipes, or even now he would substitute a two inch and a half lower pipe in place of his five inch, by which he would save the heating of 40 gallons of water, or one seventh part of his annual consumption of fuel.

I presume he will admit that 250 gallons requires more fuel to raise their temperature to a given height, than 210 would.

But there is something, so new in discussing the merits of opinions which the public have never seen and perhaps never can see without a breach of good faith, that I forbear further discussion.

This however, I will add, that nobody ever doubted the entire competency of Atkinson's plan to heat the houses to which they are applied, but the great objection has been that they are too good for the depth of the purses of those who cannot afford to throw away 1000 in every 2000 pounds of coal, which the suppression of the smoke flues probably produces. More than half of all the hot houses &c, &c, of England are now heated by smoke flues, and among the rest the new and expensive hot house of Thomas Andrew Knight and the splendid ones of the Duke of Devonshire built last summer are now heated by new built smoke flues. 'Twenty five years' personal experience induces me to say, that were I compelled to discard either my steam, and hot water apparatus, or my smoke flues, I should not hesitate to give up the two first. For this I could assign very many forcible reasons, but I select one which is sufficient. I heat my houses for about 6 months at the cost of 30 dollars only. They are together 60 feet by 16 and 12. In moderate days I only warm by the flues at a gentle rate, just to keep the houses dry. If I was obliged to get up low steam or moderately hot water every day, it would cost me 90 dollars. The former expense is better suited to my feelings.

ROXBURIENSIS.

The Southern Agriculturist for November last contains its usual quantity of valuable original matter. Among the communications we notice one from Judge Buel, 'on the culture of fruit trees in the Southern states,' from which we extract the following:

The apple produces best on a primitive formation, but gives the richest fruit and cider on the transition, abounding in calcareous matter and stones. The pear likes a moist loam inclining to clay, and the plum one still more adhesive—the cherry thrives on a lighter soil than the pear, and the peach probably does well with you on your lightest sands. There are exceptions to these rules. The breaking pears, such as the Saint Germain, &c, do best on a light sandy soil, that is, here they give the best fruit. The same may be said of several apples, as the Downton pippin,

and those generally containing the highest concentrated juices. The peach should be transplanted at one year's growth from the bud, and the apple, pear, plum and cherry at two. Plants of this kind, worked on suitable stocks, are more profitable to the purchaser than large trees, produce good crops sooner and are thrice as apt to live when transported to a distance. I know this will seem paradoxical to men unacquainted with vegetable physiology, yet it is a truth admitted by every experienced nurseryman. A small tree is or ought to be, taken up with its roots nearly entire; while a large one must suffer a great diminution by the operation. The first, having its organs entire, receives but a slight check in growth by the change. Far different with the large one. For want of the usual supply of sap which the roots supplied, the sap vessels contract and become callous, the wood becomes sickly for want of the usual circulation, and if the plant lives it seldom if ever regains its vital energy. Besides, large trees are often those which have been rejected for years in the nursery, on account of stunted growth or unhealthy appearance, and then sold to the admirers of large trees. There can be no imposition in a healthy young tree; while the packing, transportation and prospect of living, give to it a manifest advantage over a large one. For myself I would rather buy of the age I have described, than accept large ones as a gift.—*Western Tiller*.

SUNFLOWER OIL

Is extracted in the same manner as linseed, except that the seed is hulled by passing it through a machine for the purpose. Mr Barnitz of York, Pa. informed us that the production of linseed oil is declining rapidly, and that sunflower oil would soon supersede it altogether, as it is much more profitable to the farmer. The sunflower oil has been tried in paint, and found to be admirably adapted to it, as it dries with great facility. For lamps it answers a good purpose, and in some respects is superior to sperm, especially in its perfect freedom from all offensive smell. For the table we think it will certainly supersede olive oil, as it is much cheaper, and to many of a more agreeable flavor. For the last purpose we have used a great deal of it, and while we can get it shall certainly never use olive oil. By Mr Barnitz's mode of extracting it he gets a gallon from every bushel of seed. Many persons suppose that they have only to take their seed to a common oil mill, and get a gallon of oil from a bushel; but this is a mistake; the seed must be freed from its hull, and to do this a machine (of the structure of which Mr B. will give every information,) must be used. Mr Barnitz has made a large quantity of this oil this fall, and showed it to us in all its stages. He at present gives 50 cents a bushel for sunflower seed, and gets a dollar a gallon for the oil. When the business gets established the price of seed will be considerably more or that of the oil less, as at the present prices a mill steadily at work would be very profitable; the oil cake nearly pays for the extraction of the oil, it being an excellent article of food for horses and cattle.—*American Farmer*.

When inexhaustible coal mines were discovered, we were told that the poor would have coal exceedingly cheap; but it seems that the more coal discovered and the more companies established, the higher is the price of coal. Why is this? How is this?

FEEDING CATTLE IN OHIO.

A correspondent of the Scioto (Ohio) Gazette, has sent to the editor of that paper some facts relative to the business of 'Stock Feeding,' which is extensively carried on in the Scioto Valley. From these it appears that the first stock or store cattle were driven to an Eastern market in the year 1801, and the trade continued successfully for three years. It was soon found that there was no market at home for the surplus grain raised in Ohio, and the distance too great to send it to the eastward for sale; in consequence of which a citizen of Chillicothe determined to try the experiment of fattening cattle at home. Sixty head were fed in the year 1804, and the owner drove them to Baltimore, the nearest market, and to his great astonishment the project proved profitable. The succeeding year from two to three hundred were driven to the same market. In 1808, a drove was sent to Philadelphia, and subsequently others to New York and Boston, and the number now exported from the Valley alone amounts to ten thousand head per annum.

The cattle, however, are not all raised in Ohio; more than half of them are collected from different parts of the Western States, the difficulty and labor of which are exemplified in the following paragraph from the letter referred to.

'Our cattle dealers think nothing of mounting their horses and riding two, three, four, five, six and seven hundred miles in search of stock, and when they procure and collect a drove, follow them for months through the wilderness, carrying their provisions on pack horses and encamping in the woods and prairies until they reach here; then graze or feed, them and proceed with them to an eastern market. Thus have cattle been purchased at the Council Bluffs, up the Missouri, driven back and forth, and then sent on foot to the Philadelphia, New York and Boston markets, and from thence shipped to the West Indies—the entire operation of which consuming something like three years.'—*Hamp. Gaz.*

A CHALLENGE.

William Cobbett offers to bet any Yankee upon the face of the earth, *one hundred pounds*, the conditions of which bet are, that the said Yankee shall plant an acre of corn next spring in one piece, and Cobbett will plant an acre of corn in Old England; the Yankee shall have his acre standing and growing in some place within ten miles of the City of N. York. When the Yankee shall declare his corn to be ripe he shall have a square rod of it measured and from this it shall be declared how much corn the Yankee has standing upon his acre. The Yankee is at liberty to appoint one of his countrymen residing in England, to take an account of the amount of Cobbett's crop. That there may be no dispute about big corn or little corn, and the difference or amount of crop, or the difference there is in great corn and small corn in filling the bushel, the question is to be decided by the weight of shelled corn; that is to say, a rod of ground, impartially taken, shall have the ears taken off, husked and shelled upon the spot, and then weighed, and the question to be decided by the weight. Cobbett says he is perfectly serious in his challenge, and that he makes it to convince the people of the United States that the English can grow as good corn as we can and even greater crops.

EXHIBITION OF BUTTER AND CHEESE.

The Committee on Butter and Cheese, consisting of E. HERSY DERBY, GORHAM PARSONS, Esq. (assisted by Hon. PETER C. BROOKS, in the place of BENJAMIN GUILD, Esq. prevented by sickness, from attending,) report as follows:

That they are highly gratified with this year's exhibition—in both articles it greatly exceeded that of the last. For Butter there were the following entries, viz:—

No.	By whom Entered.	Where Made.	Weight.	Price sold for per lb.	Remarks.
1	Sanford Howard,	Hallowell, Me.	310	17 to 20	6 firkins.
2	Jude Kimball,	Lyndon, Vt.		18 to 19	10 do.
3	Robert Gilson,	Ryegate, Vt.	1400	16 to 17	10 do.
4	Thomas Sparhawk,	Walpole, N. H.	350		7 do.
5	Ichabod Everett,	Ellerica, Mass.	131		3 do.
6	Alexander McKee,	" "			
7	Henry Sprague,	Boylston Farm,			
8	" "	Princeton, Mass.	1300	25 to 35	20 do.—Took 2d premium, \$50.
9	Ziba Johnson,	Feacham, Vt.			
10	Wm. Warden, jr	Barnet, Vt.		16	7 do.
11	Wm. Bachop,	" "	2000	18 to 20	40 do.
12	Wm. Shearer,	" "		17	7 do.
13	Jacob Wilson,	Spencer, Mass.	100		2 tubs.
14	Calvin French,	Needham, Mass.			
15	Wm. E. Eager,	Northborough, Mass.	623	17 to 20	10 firkins.
16	Jacob Osgood,	Andover, Mass.			
17	Moses R. Bouve,	Barnet, Vt.		16 to 16½	11 do.
18	Silas Demis,	Barre, Mass.	310		7 do.
19	Lydia Page,	Hardwick, Mass.	335		3 do.—Took 6th premium, \$10.
20	Sampson Peirce,	New Braintree, Mass.			2 do.
21	Richard Hildreth,	Sterling, Mass.			2 tubs.
22	Seth Davenport,	Mendon, Mass.	325		7 firkins.—Took 3d premium, \$30.
23	Luther Chamberlain,	Westboro, Mass.	553	32 to 37	7 do. Took 1st premium, \$100.
24	Charles Lee,	Barre, Mass.	400	23	7 kegs.
25	John Prince,	Merino Island, N. H.	316		7 firkins.
26	Mary Noyes,	Byfield, Mass.	150		
27	Peter Thacher,	Attleboro, Mass.			2 pots.
28	Walter Bigelow,	Worcester, Mass.	310	20 to 21	6 firkins.
29	Mary Clark,	Northampton, Mass.			
30	Jonathan Waite,	Whately, Mass.			
31	B. & T. Lynde,	Guilford, Vt.	550		7 kegs.
32	Charles Cutter,	Weston, Mass.	131		4 pots and 2 boxes.
33	William Spring,	" "	106		5 pots and 1 box.
34	Fitch Winchester,	Southboro, Mass.	368		8 kegs.
35	Cloud Harvey,	Barnet, Vt.	600	20 to 22	26 firkins.
36	William Gilkerson,	" "	800		5 do.
37	Samuel Sawyer, 2d,	Sterling, Mass.	108		4 kegs.—Took 4th premium, \$20.
38	Oliver Sampson,	Weston, Mass.	000		2 tubs.
39	John Gilkerson,	Barnet, Vt.	000		5 firkins.
40	Nahum Hardy,	Waltham, Mass.	70		2 do.
41	Thomas Watts,	Peacham, Vt.		15½ to 16½	7 do.
42	Alanson Stevenson,	" "	15		
43	Calvin French,	Boston.			
44	Nathan Cushing,	Woodstock, Vt.	216	22	3 tubs.
45	Gershom Cobb,	" "	272	26 to 28	8 firkins.
46	Stephen Metcalf,	Croydon, N. H.	400		6 do.
47	Gabriel Parker,	Southboro, Mass.	450		4 do.—Took 5th premium, \$15.
48	Peter Harwood,	Hardwick, Mass.	312		6 do.
49	Abijah Fisher,	Dedham, Mass.	125	25	5 pots and 1 box.
50	Oliver Johnson,	Sterling, Mass.	68		6 firkins.
51	Jonathan Dudley,	Charlton, Mass.	450		5 do.
52	Levi Woodward,	Dresden, Me.	260		
53	Gershom Cobb,	Pembroke, Mass.			
54	A. J. Allen,	Boston.	100		3 kegs.

In addition to which there were a great many applications from individuals, who not having complied with the regulations of the Society, could not be allowed to come in competition for the premiums.

For Cheese there were the following entries, viz: 1 from Maine, 1 from New Hampshire, 2 from Vermont, and 14 from Massachusetts.

ENTRIES OF CHEESE.

55	Henry Sprague,	{ Boylston Farm,	527	8	New.
56	Jude Kimball,	{ Princeton, Mass. }		8½	New.
57	Jacob Wilson,	Lyndon, Vt.		7½ to 9½	Old.
58	Samuel S. Woods,	Spencer, Mass.		{ 8½ to 11 0.	
		New Braintree, Mass.	347	{ 8½ to 9½ N.	
59	Elisha Matthews,	" "			Old and new—took 2d prem. on old, \$50.
60	Welcome Newell,	" "			
61	Daniel Hunter,	" "			
62	Ebenezer Tidd,	" "			Old—took 1st premium on old, \$100.
63	Roswell Converse,	" "			New—took 1st premium on new, \$50.
64	William Tufts,	" "			
65	Job Rainger,	" "			
66	Sampson Pierce,	" "			
67	B. & T. Lynde,	Guilford, Vt.	650		
68	H. Brewer,	Framingham, Mass.	654		Old and new.
69	David Lee,	Barre, Mass.			Took 2d premium on new, \$30.
70	John Prince,	Roxbury, Mass.	420		

The quantity of butter was extremely large, estimated by the Committee to be little short of thirty thousand pounds; the greater part of which was of a very superior quality, and put up in very fine order. Some of it was in lumps and balls and arranged most fancifully in boxes, tubs and pots. The Committee feel constrained however to say, that although it appears beautiful to the eye, yet from their experience it is a mode they cannot recommend for Butter designed for winter consumption. They almost invariably found, that when a large surface was exposed to the influence of the atmosphere, it was more or less injured from that cause. They would in future recommend, that when Butter is not designed for immediate use, it should be packed in firkins or casks, by which a smaller surface will be exposed to the air.

There was a lot of Butter of 4 firkins, sent by Mrs Mary Noyes, from the Fatherland Farm in Byfield, for exhibition only, the quality of which was thought excellent by the Committee.

The Cheese in quantity did not compare with the Butter, more particularly the old Cheese, but the most of it both old and new, was of a very superior quality.

The Committee have had a very arduous and responsible duty to perform. They were assisted in their decision by some of the most judicious persons that the city of Boston and its environs could furnish: they feel under great obligations to Edmund T. Hastings, Esq. Col. Thomas Davis, William Stickney, Grenville T. Winthrop, and Newhall A. Thompson, Esqrs. the two last kindly officiated as Secretaries; also to Messrs Warren, Barry & Park, who rendered their services to the Committee for awarding premiums on Butter and Cheese, in selling the same, as expressed in the advertisement, free of charge. The Committee and their assistants devoted the whole of Tuesday from early morn until dark, without a moment's intermission, to the examination, and have concluded to award the premiums as follows:—

ON BUTTER.

- 1st premium of \$100 to Luther Chamberlain of Westborough, Mass. for entry No. 23.
 2d ditto of \$50 to Henry Sprague of Princeton, Mass. entry No. 7 and 8.
 3d ditto of \$30 to Seth Davenport of Mendon, Mass. for entry No. 22.
 4th ditto of \$20 to Samuel Sawyer, 2d, of Sterling, Mass. for entry No. 37.
 5th ditto of \$15 to Gabriel Parker of Southborough, Mass. for entry No. 47.
 6th ditto of \$10 to Mrs Lydia Page of Hardwick, Mass. for entry No. 19.

ON CHEESE.

- 1st premium of \$100 to Ebenezer Tidd of New Braintree, Mass., for old cheese.
 2d ditto of \$50 to John Matthews of New Braintree, Ms. for old cheese.
 3d premium of \$50 to Roswell Converse of New Braintree, Mass. for new cheese.
 4th ditto of \$30 to David Lee of Barre, Mass. for new cheese.

The Premium Butter sold as follows:

- 1st premium from 32 to 37 cents per pound.
 2d " " 25 to 35 " "
 3d " " 26 to 27 " "
 4th " " 26 " "
 5th " private sale.
 6th " 23 cts. per lb.

E. HERSY DERBY, Chairman.

Boston, Dec. 7th, 1831.

Agricultural.

ADDRESS,

DELIVERED BEFORE THE JEFFERSON COUNTY

AGRICULTURAL SOCIETY,

AT THE ANNUAL CATTLE SHOW AND FAIR, AT WATERTOWN,

SEPT. 27, 1831.

BY MAJOR EDMUND KIRBY.

Concluded from page 165.

Nothing marks more strikingly the progress in agricultural science, than the degree of attention which is paid to gardens and fruit. They constitute a thermometer, by which to judge the character of the farmer. Attached to every farm house, there should be a neatly cultivated garden, with a compartment allotted to vegetables, another to choice fruit, and a third to shrubbery and flowers, which last should be under the exclusive direction of the female part of the family. This may be attained without any interference with the ordinary work of the farm, and besides being a great ornament, would constitute a source of substantial enjoyment, to all the inmates of the house. A little attention to the garden, loads the table of the laboring man with the choicest delicacies of the vegetable world, supplying at once a cheap and wholesome diet; and affording a delightful retreat for the family in the hours of relaxation from work.

In the early stages of the settlement of the country, attention was mainly directed to provide the necessities of life, and an almost total disregard of its refinements and delicacies prevailed. Hence it is, that our farms and gardens are so scantily stocked with fruit trees. Public attention, however, is awakening to this deficiency, as the numerous young and thrifty orchards in every direction testify; but upon this subject much remains to be done; for it is not sufficient to plant orchards of seedling trees, and then leave them to the sole care of nature, to be overrun with grass, moss, and shoots from the roots; or to be browsed by cattle, and finally to become black-hearted and die of premature old age. Young fruit trees require as much attention as young corn, to preserve them in a healthy state. The ground should be manured and kept loose around the roots, in order to give them an opportunity to expand and impart vigor to the stock. They should be carefully pruned, at the proper season, which, in this climate, is not till after the leaf begins to open in the spring; and finally, if not already done in the nursery, they should be grafted or inoculated, with choice varieties, so as to supply the table through the various seasons of the year.

There are several nurseries in the county, especially that of Mr Hepp, in Le Ray, from which good selections, of grafted fruit, may be made; we may also resort, with great facility, to the excellent nursery of Judge Buel, at Albany, which is situated in a climate not unlike our own, and trees from them succeed admirably here. This nursery has been formed under the care of a gentleman distinguished for scientific and practical attainments, who has been at infinite pains in collecting, both from Europe and America, the most valuable varieties of every kind of fruit, suited to the climate. These can be procured from him, upon the most reasonable terms; and by means of the Erie and Oswego canals, may be brought, at a trifling expense, into the centre of the county, without any of the damage arising from land carriage.

We may now name the grape among our most sure and productive fruits. It is but little more than four years since the foreign varieties of this excellent fruit were, through the instrumentality of your President, introduced to any considerable extent, into the county; and this year the crop is most abundant, wherever those vines were disseminated. Our warmest acknowledgments are due to that gentleman, for the enlightened and persevering zeal, with which he has advocated this culture, contending against indifference and prejudice, till a high degree of success has crowned the effort.

I am not so sanguine as some, who suppose that we shall at once enter upon the business of making wine: this may follow. But I regard the grape as a most valuable acquisition to our table fruits. It is as easy of cultivation as the currant, with a little additional care in trimming, pruning, and laying down the vines, all of which operations will not occupy time enough to be taken into the account. Of the numerous varieties of native and foreign grapes, in bearing in the county, all have uniformly remained unaffected by blight or mildew, which prove so destructive to most of the foreign varieties, in many parts of the country. This we probably owe to some peculiarity in our soil, or climate, hitherto unexplained.*

On land recently cleared, the stumps form a serious obstacle to cultivation. They occupy a considerable portion of the ground, and are exceedingly unsightly. The common hard wood stumps, forming the mass of our forests, decay and disappear in a few years, but the pine and hemlock, with their roots spreading wide upon the surface, remain for ages, a great annoyance to the ploughman: their removal, therefore, is worthy of serious consideration. Pratt's Stump Extractor, provides the means of getting rid of them at comparatively little expense, and by converting them into fences, where they will answer a useful purpose for years, they are made themselves to repay the expense of removal.

I estimate that two hundred and forty such stumps, prevent the plough from taking effect upon an acre of ground. With the above machine, they may be taken entirely out of the earth, with

*The adoption of our soil and climate to the production of the grape, is now placed beyond a doubt, by the uniform success which has attended the culture of numerous native and foreign varieties, in almost every kind of soil and exposition, in all parts of the county; as well of the foreign varieties, introduced from the nurseries at Albany and New York, as of those imported directly from France by Mr Le Ray de Chamont and distributed gratuitously among the members of this society. Of these last, a vine, the Meunier, in Major Brown's garden in Brownville, a cutting four years ago, produced two hundred fine clusters last year, and more than three hundred this season. General Lawrence of Brownville, presented to Mr Le Ray, thirty-nine beautiful clusters from a vine in his garden of those distributed and planted last year. Among the great variety exhibited upon the day of the Fair, all of which were perfectly ripe and of delicious flavor, were several clusters of the white Sweetwater, weighing more than a pound each, from vines in Judge Ten Eyck's garden at Watertown, planted but two years ago. Clusters of white, black, and purple grapes were exhibited from the garden at Le Raysville: some the produce of a vine planted three years ago, which gave several clusters the very first year, more the second, and no less than fifty-six this season. In Europe, vines rarely bear the first year, but when they do they fail the second year. None of these vines are trained against walls.—Doctor Guthrie of Sackett Harbor, one of the most successful cultivators of the grape in the county, contemplates going extensively into the vineyard culture of the vine.

all their roots, at twelve and a half cents each; and they may be removed to the borders of the field, and formed into a fence for as much more.—Placed upon their sides contiguous to each other they at once form a barrier against horses and cattle, and by trimming in the straggling roots, they may readily be made good against sheep and swine. Two stumps will make a rod, and the fence is better looking, and occupies less ground than the common rail fence. Thus then, if this estimate be true, which I have reason to believe to be so, from recent inquiry in the county of Washington, where this machine is in full operation, and where the stumps form one of the most common kinds of fence, for sixty dollars, an acre of land may be brought into use in our best fields, and a hundred and twenty rods of good fence constructed, to say nothing of the great embellishment the farm will receive by the operation.

A great benefit derived from our free institutions, and one best calculated to perpetuate them, is the general diffusion of intelligence among the laboring classes through the press. By this means, all the operations of government are made to pass in review before us.—Within a few years, several papers have been established, in different parts of the country, devoted exclusively to the interests of our vocation, marking distinctly, a new era in the agriculture of the country.—It is no longer considered a pursuit, adapted to the meanest capacity, to be embraced by those only, who cannot obtain a livelihood by any other means. Men of capital and education, are devoting themselves to it, and having become familiar with its details, they, through this channel, shed the lights of science upon our path, and place our profession upon its true elevation.

Among the most efficient agents in this good work, are the *New England Farmer*, published at Boston, the *Genesee Farmer*, at Rochester, and the *New York Farmer*, at New York. These papers are filled with valuable information upon all the details of husbandry and domestic economy, and form a cheap mode of conveying instruction upon the operations, from which we draw our subsistence. Experiments upon various modes of culture are detailed with accuracy which enables us to embrace improvements with confidence; while we are warned against failures. They contain also ample directions for the management of fruit trees: a subject upon which we are singularly deficient.

Three bushels of wheat will pay the yearly subscription to either of these papers, and would form a judicious exchange for the farmer, for I think that no one can habitually read one of them, without deriving instruction from it to ten times the value of its cost.

Prudence, perhaps, admonishes me not to approach a subject, which has been heretofore repeatedly urged upon your notice from this place, without awakening that interest which its importance demands. But, when I recollect to what slight circumstances, we owe the introduction of some of the most valuable staples of the country, I am encouraged to make a few remarks upon the silk worm; a culture which bids fair, at no distant day, to afford employment to a numerous class of our population.

The thrifty appearance of several young nurseries of the white mulberry, which furnishes the food of the silk worm, shows that the tree may be cultivated among us, without difficulty;

and a successful experiment this season, by the President of the society, in rearing the worm, removes the only doubt that the business may be made a source of profit to every man, who has room for a few mulberry trees. The cocoons produced in the United States, have been pronounced superior to those of Europe, and those produced by Mr Le Ray de Chaumont are believed to be equal to any in the country.

The management of the silk worm is perfectly simple, occupying but a few weeks in the spring and all the labor may be performed by females, by the aged, and by children. It is asserted by one of our distinguished countrymen, now in the Mediterranean, and who is preparing a digest of a very simple mode of cultivating the silk worm, and preparing the silk, adapted to the most simple form to the use of families, that its cultivation is not as troublesome as the cultivation of flax, and infinitely more certain and profitable.* He remarks, you will be surprised at the simplicity of all the means of obtaining silk, and of the little trouble attending it.

But facts make a stronger appeal to the understanding than arguments. It is stated in the New England Farmer, that the town of Mansfield, in Connecticut, alone, has produced this season, five tons of silk, worth in market, eighty-five thousand dollars. This rich source of wealth is within our reach, with little other effort, than to plant the mulberry tree; which is as easy of cultivation as the apple tree.

This culture recommends itself to our notice in a peculiar manner. In older parts of the country, especially in some of the New England states, it has already become a question of public discussion, how the daughters of a numerous class of farmers, are to find employment, which shall prevent their growing up in idleness, a burden to their parents, on the one hand; or going out to service in the families of their more wealthy neighbors, on the other. The spinning wheel and the loom, have until lately afforded occupation for that class; but the improvements in machinery, by which the woollen manufacture is at present prosecuted, and the extensive substitution of cotton stuffs for woollen, in household use, throw female labor out of competition. The culture of silk seems to afford the desideratum required; for the whole operation may be performed by female labor, and that too with such facility, that a single female may, in a few weeks, without extraordinary exertion, produce silk to the amount of a hundred dollars.

The appropriate education and employment of females, in all ranks of life, is a concern of the highest importance; for precisely upon these two circumstances, does her usefulness depend. Among barbarous nations, woman is reduced to the level of the beasts of burden; and among some of the people of the old world, she is denied the common attribute of humanity; with both, she derives from man merely that degree of consideration and protection, which he extends to his other property. It is only under the Christian dispensation, that she rises to the full enjoyment of her just rank, and participation in the concerns of life. The customs of society, having a just regard to that refinement and delicacy, which attach to the female character, and constitute its greatest charm, have excluded her from occupations deem-

ed peculiarly masculine; from participation in the business of legislation and government; from exercising the function of public teachers of our holy religion; and from the labors of our field. But in the domestic circle she shines pre-eminent. There she crests her throne, and from it silently influences the affairs of men. Encouraged by her smiles, we are stimulated to the performance of our best actions.—Much of the prosperity enjoyed by our society, may be ascribed to the zeal with which the objects of our institution have been promoted by the fair daughters of Jefferson county. They have entered into a spirited competition for our premiums, upon the various articles of household manufacture, that most valuable and fertile source of national wealth; and above all, they have uniformly, as upon the present occasion, cheered us by their presence at our anniversary meetings. While such continues to be the case, our society will be perpetuated and its benefits will be diffused.

From London's Magazine of Natural History.

ON HARES TAKING THE WATER

I think I am enabled, by decisive facts, to settle all doubts respecting the capability or inclination of hares for taken the water; a curious point of natural history, which has drawn the attention of some of your correspondents at various times. Near my residence there is a large sheet of water, in which there is a small island at no great distance from the shore. Conceiving that the spot might be made a convenient receptacle for hares or rabbits, I at various times, as opportunities of catching them occurred, turned out several of each species; but was surprised, on subsequent visits, never to meet with a single individual. For a time I thought that they had been drowned in attempting to escape, or been starved from a deficiency of proper food; though, as the island abounded in rich vegetation, untouched, of course, by cattle, I could not so easily admit the latter supposition. One day, however, on landing, I was startled by a large hare bounding up, which I knew could not be one placed there by myself, as many months had elapsed since I had repeated my experiment of peopling the island. On seeing her rise, I immediately returned to the boat for a dog which had accompanied me; when, to my surprise, I saw her in the act of swimming towards the mainland at a steady pace, and before I could cut her off, she had effected a landing, and, after shaking herself, went away at full speed. On examining the island, I found a regular hare track from the point whence she started, through the rich grass, to her seat; an evident proof that she was in the habit of crossing the ferry, and resorting for the day in a situation which she had wisely selected, as removed from alarm of dogs, guns, and sportsmen. This is not the only instance I have to offer: another occurred in the case of a three-fourth-grown leveret, which accidentally fell into my hands, and whose motions I determined to watch after landing it on the island. For a time it ran about in a state of uneasiness, when, as if aware that it was under restraint, it made for the nearest point to the land, and without a moment's hesitation, as a matter of course, plunged boldly into the water, and, like its more experienced predecessor, swam on shore with the greatest ease and confidence.—E. S., F.L.S. July 21, 1831.

SNAKES TAKING THE WATER.

SIR—I was not aware until I read the article on this subject that any doubts had been entertained respecting it. Snakes will not only enter freshwater ponds and rivers, but will cross considerably channels of the sea. About thirty years since during my first excursion into North Wales I met by accident at Carnarvon with the Rev W. Bingley, author of *Animal Biography*; we engaged a fishing-smack, to sail for a day on the southern coast of Anglesea, and to land us on those parts we wished to examine. It was a brilliant cloudless day, in the month of August. On our return in the evening, I was surprised by a sudden cry of the bontinn, when, about fifty yards south of the vessel, we saw a snake, with its head raised about one foot above the water, progressing rapidly towards the Isle of Anglesea: the snake was then in the broadest part of the Menai, nearly a mile from land on either side of the straits. The head and neck had an oscillatory motion. One of the men in our vessel threw out a small cork boat, and with oars and the most dreadful imprecations hastened to arrest the progress of the poor animal, which appeared to have no power of escape by diving. After a few strokes with his oar, the man succeeded in frowning the snake, and bringing it into our vessel. It was nearly a yard in length, and differed in no respect from the common snake. Mr Bingley, who was well acquainted with that part of Wales, said that snakes abounded in the southern part of the Isle of Anglesea; and were frequently seen crossing thence to the Carnarvonshire coast. The common people entertain many superstitious notions respecting them, and their association with demons and wizards; this, he told me, was the cause of the rage with which our Welsh boatman pursued the snake we had just taken. It is curious to imagine now an animal like the snake could first ascertain the existence of land across a strait so broad as the Menai on its southern end; and by what instinct it was first impelled to undertake so long a voyage of discovery.

Lain, Sir, yours, &c. ROBERT BAREWELL.
Hampstead, June 7, 1831.

P. S.—The frequent passage of snakes across the Menai, to and from the Isle of Anglesea was further attested by fishermen whom I questioned respecting it. They said that the snakes generally deposited their eggs on the low grounds on the Anglesea coast.—R. B.

Hares taking the Water.—I once saw a hare that was closely pursued spring into a river about 20 yards wide, and swim boldly across it. Rabbits will take water when less pressed, as I have seen four, and heard of more, to do so, which might have easily escaped without getting wet. In one case, although a man stood on the bank which the rabbit was striving to gain, and the bank was not more than 1½ ft above the water, the rabbit dived, and made its escape.—Henry Turner, Botanic Gardens, Bury St Edmunds, May 15, 1831.

Lotteries.—The evils resulting from lotteries are beginning to excite the attention of the Philadelphians. Public meetings have been held. A committee has been appointed to memorialize the legislature—another to collect facts. If the latter committee perform their duty faithfully the effect will be overwhelming.

* Com. Porter's Letters.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, DEC. 14, 1831.

'Knowledge for the People.'—Lilly and Wait, and Carter and Hendee, have just republished the fourth number of this delightful little work. It is devoted to zoology; the modes and habits of life of birds, explanations of the phenomena of their flight, migration, &c. We consider this one of the most popular and truly useful publications of the day. The following extract is taken from the present No.

BIRDS

Are extremely important creatures in the economy of Nature in general; although their immediate utility to mankind is infinitely less than that of mammifera. They destroy innumerable insects; and the thoughtless extirpation of some birds, supposed to be noxious, as sparrows, crows, &c, in many districts, has generally given rise to an infinitely more prejudicial multiplication of vermin. Other birds destroy larger animals, as field-mice, snakes, frogs, lizards, or consume carrion. Many extirpate weeds. On the other hand, they assist the increase and propagation of animals as well as plants. For instance, it is known that wild-ducks, in their migrations, carry impregnated spawn into remote ponds, &c, and thus stock them with fish.* Many birds swallow seeds, which are subsequently expelled whole, and thus extensively dispersed: as the doves of Banda, with the nutmeg. The excrement of sea-birds matures bare cliffs and coasts, so as to render them capable of producing useful plants. Many species of falcons may be taught for the chase, as well as the cormorant for taking fish. Many birds, together with their eggs, fat, &c, serve for food: the entire skins of sea-birds for the clothing of many Northern nations; the feathers for stuffing beds, for writing, for various and often costly ornaments; in which respect, also, they form an important article of trade among many savage people, particularly the islanders of the Pacific Ocean.—*Blumenbach.*

* Insects have also been known to stock ponds on hills with fish. The large water-beetle, which feeds upon the spawn of fish, occasionally, in the evening, climbs up the stems of rushes, &c, out of the water, so as to take wing; in these circumstances it has been caught, and, on being put into water, has been found to give out the spawn with which it had gorged itself previous to taking flight, both in a digested and undigested state; so that, on trial, it has been found to produce fish of various kinds.—*Jameison.*

State of Society in Natchitoches.—A new paper just started at Natchitoches in the Southwestern part of Louisiana, gives us some curious information on the holiday amusements of the inhabitants of that remote section of the country. A foot race is to be run on Christmas day between two old fools, one aged 68, the other 72; large bets were pending on the result. They had better prepare for another and a final race. It is stated also that there is 'fine sport in the way of horse racing every Sunday. Jockeys would do well to attend, bet run high,' &c, &c; there is but one church in the place and that is *Roman Catholic.*

Capt. Mackay's Pigs.—Capt Mackay killed two of his pigs, last week, 20 months old, which when dressed weighed 1218 lbs.

EXTRAORDINARY COW.

MR FESSENDEN—

SIR—I have observed in your Farmer frequent accounts of the celebrated imported breeds of cattle by J. H. Powell, Esq. particularly of a Cow, in No. 20 of the present volume. From that some might be led to suppose that we have no native cows in the country, which can bear a comparison to those therein mentioned. But when a person owns one, which evidently possesses equal qualities, I think that the account of it, in your journal, would be interesting if not useful to the public; especially if she be of entire native breed. I therefore give you an account of one owned by Mr A. Curtis of Newton, Mass. from which has been made over 12 lbs. of butter per week, week after week, under the following circumstances, viz. she was pastured in a very ordinary (Needham) pasture, or I might say a very poor pasture, compared to those in which farmers generally pasture good cows. Besides the greatest quantity of cream was not obtained, which might have been under judicious dairy management. Her milk was put into common tin milk pails filled nearly full, and placed in a common cellar, and the milk skimmed but once. The milk was better, (to use Mrs Curtis' expression) after being skimmed than many cows' milk is before skimming. As they use the milk for the family they do not care to get the greatest possible amount of cream from it. Now, sir, I do not believe that there is a cow of the imported breeds in the country from which can be made more butter in one season, nor butter of a better flavor or color, with the same keeping and management with the milk, than can be made with the cow I allude to. As to the richness and color of this butter it is not surpassed by any brought to Boston Market.

It is not made with a view to effect a sale of the Cow; for I saw Mr Curtis refuse \$75 for her last summer, and I do not believe that he would part with her for twice that sum. But my object is to convince the public that we have stock equal to the imported breeds, and to induce farmers to preserve their fine stock, and not kill the calves for veal, as is the usual practice in the vicinity of large towns; as this is more frequently done with a calf from a good cow than from a poor one. I will give a description of the cow, as respects her size, shape, &c, if any one wishes it.

Respectfully, yours,

Boston, Dec. 5, 1831.

E. C.

Poisonous Confectionary.—The Journal of Health has an article which goes to show the danger of a too free use of colored confectionary by children. The articles used in coloring are sometimes poisonous—or, at least, medicinal—such as red lead, gamboge, red precipitate of mercury and even copper. Though the most diversified colors for confectionary may be obtained from the most harmless ingredients, yet such are not always used. The deep colored paper used in wrapping loaf sugar, has also been found upon analysis to contain both arsenic and copper.

Tennessee will soon have to buy land for its teeming population. A law of that state gives 200 acres to each child, where three or more are produced at a birth, and the applications are not un frequent. On the 1st inst. a man from Smith County, applied for 600 acres.

HORTICULTURAL PREMIUMS.

At a meeting of the committee of the Massachusetts Horticultural Society on fruits on Saturday, the 3d Dec. 1831, the following premiums were awarded:—

For the best summer pears (Dearborn's Seedling) to Hon. H. A. S. Dearborn, \$4 00
For the best Autumn pears (Bourne du Roi) to John Prince, Esq. Roxbury 4 00
For the best native Pears, (Dix,) to Madam Dix, 4 00

This fruit appeared to great advantage the present season, fully sustaining the high reputation it had heretofore attained.*
For the best peaches (to Mrs Mackay of West-ton) 4 00

For the best foreign grapes cultivated under glass (Black Hamburg) to Mr Charles Senior of Roxbury, 5 00

Mr Senior also presented some very large and fine clusters of Black Hamburg of open culture grown under his care in the garden of Mr Haynes; the latter not being a member of the society the committee regret not being able to award a premium.

For the best foreign grapes of open culture (Black Hamburg) to Mr Charles Lawrence, Salem, 5 00

For the same, to Mr C. Cowing of Roxbury 5 00

With regard to this fruit the largest clusters presented by Mr Lawrence and Mr Cowing were of precisely the same weight, and the berries equally beautiful and although the product of Mr Lawrence's vine (4 years old) was the largest, it having produced this season 56 clusters of ripe fruit, several of which exceeded a pound and the largest a pound and a half in weight, yet so very similar were these beautiful specimens, that the committee have thought it best to award the society's premium to both.

For the best native grapes (Isabella) to Mr Samuel Pond of Cambridgeport, 3 00

For the best gooseberries (five varieties of Lancashire) to Mr Samuel Walker of Roxbury, 2 00

For the best strawberries (Keens' seedling) to Mr David Haggerston, Charlestown, 2 00

For the best Raspberries, red and white Antwerp, to Hon. H. A. S. Dearborn, 2 00

In consequence of the season having been so unfavorable for cherries, plums, apricots, and nectarines, very few were exhibited and none which were thought to be worthy of premium; the same remarks will apply to apples, although of the latter fruit a few handsome specimens were presented.

By order of the committee,
S. DOWNER, Chairman.

* See New England Farmer, vol. viii. page 161.

France, in 200 years, constructed 900 miles of canal; England, in 70 years, 2752 miles: and the United States, in 14 years, 2500 miles, of which there are in Pennsylvania 900.

It was stated on Sunday last, in the pulpit, by one of the clergy, that nearly 20,000 persons are sick in Boston—this, though about one third of our population, we think is no exaggeration.

An English publication states that the annoyance of grass or weeds springing up between the stones of pavements and in gravel walks, &c, may be got rid of for years, by watering with a solution of lime and sulphur in boiling water.

FISH PONDS.

In some part of Europe, fish ponds are very valuable property. They might become so in this country, if properly stocked and attended. Particularly might this branch of business prove valuable in the neighborhood of our large cities. A late English paper mentions that in some of the ponds in Hampshire, five acres of water support 1250 brace of Carp and Tench, until the stock are fit for market, and have obtained an average size of 2 lbs. per brace, and consequently weigh 2500 lbs. at ninepence per pound, the price at which they are usually sold to the London fish-mongers, will amount to 93l. 15s. the value of five acres of land so employed for 3 years.

A recipe to prevent Boots from taking water.

Take seneca oil and gum elastic; one ounce of the latter to be cut into thin shreds and dissolved, in a pint of the former, and when dissolved, which will be in a few days, the boots are to be completely saturated or charged with the mixture. The manner of preparing the boots is as follows: Take a sponge, and rub the mixture in until the leather will absorb no more of it; the boots are then laid by for a day or two, when the process is repeated. The soles as well as the uppers are to be thus rubbed, and the operation is to be performed either before a fire or in the sun.

BOSTON MARKET.

The snow has fallen so level, that travelling is excellent in all directions through and from the city; and the prices of country produce are such as to induce farmers to improve the present opportunity to visit us. Whole hogs are selling at 6½ cts. per lb. for large size—5½ for small ones. Green oak wood, \$9 per cord—Pine, \$6.50. Cranberries, \$4.50 per barrel. Chesnuts, \$2 to \$2.50 per bushel. Shagbarks, \$4 per bushel. Eggs, 30 to 33 cts. per dozen. Charcoal, 40 cts. per basket.

Mr H. Dean, No. 61 Beacon front Market, has some fine cheeses from Herkimer county, N. Y.; they are of fine quality, and excel in magnitude any we have seen, a few of the largest weighing 137 lbs. each—they were sold at 17 cts. per lb.

NOTICE.

Doctor Ward's Address before the Massachusetts Horticultural Society in September, has recently issued from the press of Messrs J. T. & E. Buckingham. Members of the Society and subscribers to Mount Auburn, are requested to call at the office of Z. Cook, Jr, 7½ Congress street, for a copy.

NOTICE.

An adjourned meeting of the Massachusetts Horticultural Society will be held on Saturday next, at 11 o'clock; the seeds from Albany will be distributed.

R. L. EMMONS, Secretary.

Tea Wheat.

A few bushels of this very valuable variety of spring Wheat is this day received, for sale at J. B. Russell's Seed Store, No. 50½ North Market street, from the vicinity of Lake Erie. Persons in want of it are advised to call soon, as the supply is small, and many were disappointed, in not being able to get the Black Sea Winter Wheat, from the same source. One kernel of this wheat was discovered in a chest of tea in St John, New Brunswick, in 1823, from which the present variety has been disseminated. See N. E. Farmer, vol. ix, page 105—and vol. vi, page 82.

Pear Seeds.

For sale at the Seed Store connected with the New England Farmer Office—
One bushel of fresh Pear Seeds, of excellent quality.

Mackay Pigs.

For sale, 10 first rate pigs, of the genuine Mackay breed. They are about six weeks old, of good size and fine form. Inquire at the N. E. Farmer Office.

Flooring Boards, &c.

Of hard Southern Pine, or Eastern White Pine, furnished to order, neatly planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, JR, 65, Broad street.

Seeds for Country Dealers.

Traders in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed that they can be furnished at the New England Farmer office, No. 50½ North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as they can be procured in this country, neatly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and SWEET CORN, &c, of different sorts.

¶ The seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves.

Nov. 12

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c, &c, which he will dispose of at as low a rate as can be purchased in the city. ¶ Watches repaired and warranted.

Black Currant Wine.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street, Boston.

A further supply of superior old Black Currant Wine, made under the inspection of John Prince, Esq. Roxbury; an account of its stringent and detergent properties in various complaints, will be found in the N. E. Farmer, vol. 9, page 267, written by S. W. Pomeroy, Esq. and the late Doct. J. G. Coffin. It is highly salutary in many summer complaints. Doct. Coffin states: 'It has been attended with remarkable success in the early stages of cholera morbus and dysentery—and again also in the later stages of these diseases, after the symptoms of inflammation or febrile excitement had ceased. It has been strikingly remedial in the low states of typhoid and bilious fever. The late Capt. Gilchrist, who for several years followed the Patavia trade, and who had always suffered an attack of the severe cholera which proves so destructive of human life in that climate, used to say that after he had this wine with him, and took two glasses of it every morning, he escaped the disease. On one voyage, his mate, who had not taken the wine, was seized with this complaint, when a bottle or two stopped its progress. We have not room to enumerate many other morbid affections in which this wine has proved useful. In sore throat it has for many years been considered almost a specific remedy.—Price 75 cts. per bottle.

For Sale,

A fine Farm, lying in Dorchester, six miles from the old State House, containing 90 acres—consisting of mowing, pasture, orchard and wood; a few acres of it is salt marsh, situated at South Boston.

There is a handsome two story house in good repair, finely situated on a hill, having a very commanding prospect of the country, handsomely finished; a large barn with an excellent cellar under it for vegetables, shed room, pigsty, &c, &c; a farm house, nearly new, and ice house—the whole combining as pleasant a situation for a gentleman as can be found in the vicinity; the land is in good heart, and would make an excellent milk farm; 60 tons of hay have been cut from it this season, and 10 cows kept on it; it is the farm formerly owned by John Gray, Esq. For further particulars apply at the New England Farmer office.

BRIGHTON MARKET—Monday, Dec. 12.

[Reported for the Chronicle and Patriot.]

At market, this day, 836 Beef Cattle, 526 Stores, 1100 Sheep, and 2449 Swine. About 1000 Swine have been before reported.

PRICES.—*Beef Cattle*—The best qualities (market cattle) sold a little higher, but barrelling Cattle were not in so great demand, and were taken at rather less. We shall quote for extra \$5 23 a 33, prime 5, good 4 62 a 4 88, then 3 a 1 37½; we noticed one or two yoke taken at 5 50.

Barrelling Cattle—The barrellers were unwilling to pay last week's prices: some Cattle were purchased at less. We quote for Mess 1 a 4 25; No 1 3 50 a 3 75.

Stores—Many sales effected at former high prices.

Working Oxen—We noticed sales at 55, 59, 60, 72, 73, and \$80.

Cows and Calves—At 18, 21, 23, 25, 28, and \$40.

Sheep—Dull: sales, in lots, at 1 75, 1 84, 1 92, 2 17, and 2 25. Some beautiful wethers were at market, but not old.

Swine—Market glutted! We have reported some of the best to 6 times. About 150 only were sold this day. One lot of 30 selected Barrow Shotts at 4½; one of 10 selected at 4. Retail, 3½ a 4 for sows, 4½ a 5 for barrows.

New York Cattle Market, Dec. 9.—In market this week about 800 head of Beef Cattle, from 2000 to 3000 Sheep and Lambs, for which there has been rather a slow sale. Beef Cattle sales have ranged from \$5 50 a 6, some few very fine 7. Sheep \$2 to 5, a few extra fine Cosset wethers 7 50; Lambs 1 50 a 3. Dressed Pork—Large lots have arrived this week: sales at \$3 a 5 50, the fair average 5 25. Live Hogs—What few have been in, sold at 4 00. Cows and Calves—Sales dull, 20 a 35—average about \$25—*Daily Ad.*

MISCELLANY.

The following seductive song may amuse some of our readers; but will be powerless, in such prosperous times as the present. We copy it from that excellent paper, the *Detroit Courier*, in which it has been recently republished.

THE MICHIGAN EMIGRANT'S SONG.

Tune.—John Anderson my Jo Join!

Come all ye Yankee Farmers
Who'd like to change your lot,
Who've spunk enough to travel
Beyond your native spot,
And leave behind the village
Where Pa' and Ma' do stay,
Come follow me and settle
In *Michigan*.

I've heard of your *Penobscot*,
Way down in parts of *Maine*,
Where timber grows in plenty,
But darn the lot of grain;
And I have heard of *Quoddy*,
And your *Piscataqua*,
But these can't hold a candle
To *Michigan*.

And you that talk of *L'armount*,
Why what a place is that;
Be sure the gals are plitty,
And cattle very fat;
But who among her mountains
Mid clouds and snow would stay,
When he could buy a Prairie
In *Michigan*.

And there's your *Massachusetts*,
Once good enough, be sure;
But now she's always laying on
Taxation or manure;
She costs you pecks of trouble,
But de'il a peck can pay,
While all is scripture measure
In *Michigan*.

Then there's your land o' *Blue Laws*,
Where deacons out the hair,
For fear your locks and tenets
Should not exactly square;
Where beer that works o' Sunday
A penalty must pay,
While all is free and easy,
In *Michigan*.

What country ever grewed up
So great in little time,
Just popping from the nursery
Right into like its prime;
When *Uncle Sam* did wear her,
'T was but the other day,
And now she's quite a lady,
This *Michigan*.

Upon the river *Clinton*,
Just thro' the country bark,
You'll find in shire of *Oakland*
The town of *Pontiac*—
Which springing up o' sudden,
Scar'd wolves and bears away,
That used to rove about there,
In *Michigan*.

And if you follow downwards,
Why *Rauchster* is there;
And further still *Mount Clemens*
Looks out upon *St Clair*;
Besides some other places
Within *Macombia*,
That promise population
To *Michigan*.

Or if you'd rather go to
A place called *Washtenaw*,
You'll find upon the *Huron*
Such lands ye never saw;
Where ships come to *Ann Harbor*
Right through *La Plaisance bay*,
And touch at *Ypsilanti*
In *Michigan*.

Or if you keep a going
A great deal further on,
I guess you'll reach *St Joseph's*,
Where everybody's gone;
Where everything, like Jack's bean,
Grows monstrous fast, they say,
And beats the rest all hollow
Of *Michigan*.

Then come, ye Yankee farmers,
Who've mettle hearts like me,
And elbow-grease in plenty,
To hew the forest tree;
Come take a Quarter Section,
And I'll be bound you'll say,
This country takes the rag off,
This *Michigan*.

HOUSE-KEEPING.

The true economy of house-keeping is, simply the art of gathering up all the fragments, so that nothing be lost. I mean fragments of *time*, as well as *materials*. Nothing should be thrown away so long as it is possible to make any use of it, however trifling it may be; and whatever be the size of a family, every member should be employed either in earning or saving money.

If you have a greater quantity of cheeses in the house than is likely to be soon used, cover them carefully with paper, fastened with flour paste so as to exclude the air. In this way they may be kept free from insects for years. They should be kept in a dry cool place.

Instead of covering up your glasses and pictures with muslin, cover the frames only with cheap yellow cambric, neatly put on, and as near the color of the gilt as you can procure it. This looks better, leaves the glasses open for use, and the pictures for ornament, and is an effectual barrier to dust as well as flies. It can easily be re-colored with saffron tea, when it is faded.

The fumes of brimstone are useful in removing stains from linen, &c. A strong flower water can be held in the fumes of a brimstone match, the color will soon begin to change, and at length the flower will become white. By the same process, fruit stains or iron moulds may be removed from linen or cotton cloths, if the spot be previously moistened with water.

When plain tortoise shell combs are defaced, the polish may be renewed by rubbing them with pulverised rotten stone and oil. The rotten stone should be sifted through muslin. It looks better to be rubbed on by the hand. The jewelers afterwards polish them by rubbing with dry rouge powder, but sifted magnesia does just as well—and if the ladies had rouge, perhaps they would, by mistake, put it upon their cheeks, instead of their combs; and thereby spoil their complexion.

Frugal Housewife.

The buttons on the coat of John Hancock were of silver, and of American manufacture—the device, a shepherd shearing his sheep—the motto, 'you gain more by our lives than by our deaths.'

In Berkshire county, lately, a gentleman observed a very corpulent man passing, and inquired who it was: 'Why, that is Mr —, father of the town.' 'Bless me,' said the inquirer, 'and he seems just ready to be delivered of another town.'

Spirit of candor.—'Where are you going, Sawney?' said one Scotch journeyman baker to another. 'E'en to the club, mon, to contradict a bit, was the sapient reply. How much existing opposition is precisely of this description.

Simple cure for Intemperance.—If a person addicted to and fond of frequent drinking of spirituous liquors, will for a week or two adopt a mild diet of bread (or suppaun) and milk, he will find that he has no desire for strong drink. One great cause of drinking, is animal diet and excessive indulgence. Where milk, or vegetables are the chief diet, there is no intemperance. What an easy remedy for one of the most degrading and destructive evils of the age! and who that has been in the habit of intemperance, would not wish, at any sacrifice or self denial, to save his family, as well as himself, from shame and ruin.—*N. Bedford Mercury*.

Receipt for a Cough.—Take of liquorice, antimonial wine, and pargoric, each one ounce—dissolve the liquorice in a pint of warm water and boil it down to a half pint; when cold add the wine and pargoric—take one table spoonful three or four times a day.

If the patient has pain in the bones, relief will be found by taking a pint bowl of white balsam tea, on going to bed.

The above is offered during the present influenza, by one who has tried it himself, and known it to be used by numbers with signal success.—*N. Bedford Mercury*.

A mechanic in the north has invented a machine for seminaries, which by means of steam, not only warms the room, but flogs all the boys on a graduated scale according to their offences.

Cobb's Treatise on Silk.

Just published, and for sale at the Agricultural Warehouse and Seed Store, No 501 North Market street, A Manual, containing information respecting the Growth of the Mulberry Tree, with suitable Directions for the Culture of Silk.—In three parts—with colored engravings. By J. H. COBB, A. M. Published by direction of His Excellency Gov. Lincoln, agreeably to a Resolve of the Legislature of Massachusetts. Price 37½ cents. Oct. 26.

Ammunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 6: Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned Jan 1.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[P] No paper will be sent to a distance without payment being made in advance.

GOVERNMENT REPORTS.

LEAVES OF THE WILD CHERRY.

To the Editor of the New England Farmer.

SIR—I noticed in your useful paper of the 11th two communications respecting the poisonous quality of the leaves of the WILD CHERRY, and felt a degree of alarm at the determination of one of the gentlemen to cut down and exterminate every tree and bush under that name, while I was carefully preserving some in my garden for its valuable medicinal virtues. I have given a strong decoction of the twigs of the wild cherry tree again and again, to men, women, and children, with the happiest effects, according to the indications. Nevertheless Mr Prince and Mr Tully may be right in their denunciation of the wild cherry tree as it regards sheep, especially if they mean the *Prunus lauro-cerasus*, while I mean the *Prunus virginiana*. The fruit of both of them are used indiscriminately, in making that common sleighing-dram, cherry rum, which men and women may partake of at this cold season without risk of dying the death of a sheep, and that as a rare and innocent luxury. [?]

For diarrhoeas, and in certain stages of protracted dysenteries, I have never found a better remedy than a decoction of the branches of the wild cherry tree in summer, and of its roots in the winter. I am therefore anxious that it should not be condemned and executed without a fair trial.

It is true that the twigs, leaves, and roots of the same tree have often differing qualities, and give out their *quintessence*, or essential medicinal qualities, some more to hot water, some to spirit and some when taken in substance into the stomach in form of powder; the last of which may be deleterious, and the others not. Again, some quadrupeds can feed on some plants, that others turn from with aversion; as the goats will eat belladonna which scarce any other animal will touch. All eschew tobacco except man.

I wish some gentlemen of leisure and scientific discrimination would make a series of experiments to determine facts respecting the two species or rather varieties of the wild or indigenous cherry tree. I say *indigenous*, because if you burn down a lot of trees of any sort, the wild cherry most frequently grows up from out the ashes. Besides the native cherry tree is next to our maple the handsomest wood for the cabinet maker; it is the New England mahogany.

Mr Tully speaks in commendation of the common plantain as a speedy remedy in sheep poisoned by the wild cherry. If by common plantain he means the *Plantago lanceolata*, there is not in the whole materia medica a more universal alexipharmic or counter poison, than the common plantain, growing everywhere about our yards and barns; if applied to the poisoned sores made by the stings of the bee, wasp, or hornet, it surprisingly soothes the anguish and diminishes the angry swelling. Some have said in print, that where the toad is bitten by any venomous reptile or insect, he straightway has recourse to the leaf of the common plantain. 'Make experiments, and observe nature,' says Lord Bacon, and so says your humble correspondent,

Cambridge, Dec. 17, 1831.

B. W.

AGRICULTURAL PREMIUMS.

MR FESSENDEN—

SIR—The subject of agricultural premiums is of great importance. The amount of money distributed in this way by the State and County societies is considerable. It has always proved a powerful means of exciting competition and enterprise and care; and these are the great instruments of public improvement. It is on every account desirable that this public bounty, so honorable to the State and to individuals, should not be abused, nor improperly applied; and that it should be rendered in the highest degree possible available to the public spirited objects for which it is bestowed.

I have nothing to say of the abuses of the bounty, for I know of none; but there are conditions of its bestowment, which the Societies have a right to make, and which, if they do not make and rigidly exact, the public fail of some of the principal advantages of these bounties, which they might expect.

There are two objects to which these premiums are adapted; first to ascertain what can be done; and second, when anything valuable is done, how it was done; to induce individuals to make experiments, inventions, and discoveries in agricultural science or practice; and to secure for the agricultural public the advantage of such experiments, inventions and discoveries, by a full detail, not only of the results, but the means and process by which such results were obtained. If the public pay a bounty or reward for any agricultural experiment or produce, they have a right to know how they themselves may realize a similar produce. The mere fact that a man has raised so many bushels of corn to an acre; or exhibited an animal weighing so many pounds; or produced butter which is adjudged, and with perfect justice, deserving of the splendid premium of one hundred dollars, are of little consequence to the public, compared with knowing in respect to the crop, what was the nature of the soil, the manure applied, the kind planted, the distance of the plants, and the time of planting and gathering; in respect to the animal, the stock from which he is derived, the manner in which he has been reared, the quality and quantity of the food which he has consumed, the general mode of attendance and the balance of loss or gain in the experiment; and in respect to the butter, from how many cows it has been produced, the nature of their pasture and keep, the mode of setting the milk, the time of taking the cream, the manner of churning, the quantity and kind of salt used, and the way of putting it down for market.

In the Medical Society of Mass., I believe it is a standing rule that if a member makes any fortunate discovery in medicine, or composes a pill or draught or cataplasm of extraordinary efficacy, he is required to make it known to his brethren under penalty of expulsion. I do not know that there is any disposition on the part of the agricultural community to keep anything secret in any of their operations; though the celebrated Bakewell, the famous breeder of stock in England, is said to have concealed until his death the principles of the art by which he effected such extra-

ordinary improvements in his live stock, and obtained such immense profits. But certainly where men receive the public bounty in the form of premiums, the public might justly claim to know the means of their success, otherwise they are debared the most important advantages, which they expect from these premiums.

I have been led to these remarks by the character of the agricultural reports with which we are generally furnished, and which contain little else than a string of names, the article exhibited, and the amount of premium awarded.

These are about as interesting, excepting to the successful competitors and their friends, as a column in a spelling book or a list of names of towns or representatives in the Register.

These suggestions are offered with perfect respect to those gentlemen upon whom devolves oftentimes the difficult task of awarding these premiums. In cases of crops, the Mass. Society have always and very properly required a particular account of the cultivation. This with every Society and in every practicable case should be an invariable rule.

In respect to animals, which have been honored with premiums this year, whether milch cows, fat animals, or others, scarcely in any of the reports with which your paper has been filled, has there been any specification of their produce, valuable properties, descent, mode of keep or feed, and other circumstances, which it is desirable to know. In the report of the award of the liberal premiums for the produce of the dairy recently bestowed, we have none of these particulars in regard to the dairy management, which we greatly want, and which would be of essential service to the community. Perhaps they are heretofore to be given. But whether now to be given or not, is it not desirable that in all future awards the successful competitors should be required, before the premium is paid, to give a detailed account of their dairies, their cows, feed, management of their cream and milk, and mode of churning or cheesemaking; and that these details should be fully laid before the public?

Salem, Dec. 15, 1831.

II. C.

EXACTNESS.

Actual experiment is certainly the best of all teachers in agriculture as well as in every other art or science. Here facts are infinitely better than theories. But experiments to be relied on cannot be too accurately performed; and in order to be made beneficial to others must be most exactly and completely detailed. Nothing can be further from exactness than the habits of our common farmers. They seldom weigh or measure anything, and in nine hundred and ninety-nine cases in a thousand you will find them satisfied with 'guessing that a thing is about so.' They guess that a certain cow gives about so much milk; that they cut about so many tons of hay; that they have about so many bushels of corn or potatoes to an acre; without ever taking any pains to ascertain the facts. Now all these things are susceptible of exact measurement, and conjecture in these cases is perfectly vague and deceptive. It often does much injury, for the exhi-

dence with which men speak in cases where certainly they have no right to be confident, leads the too credulous and inexperienced into false expectations and pernicious mistakes. I have myself been often disappointed by such confident misstatements, and have long since become so perfectly skeptical in regard to all such accounts as to regard them, let them come from what quarter they will, with no attention, unless they are detailed in so exact a form that their authors are willing to make oath to them. They are but too often of a character to remind us of the testimony of a witness, given on the stand, who being asked how large was the stone with which he saw the defendant strike the plaintiff, after various attempts to describe it, 'guessed that it was about as big as a piece of chalk.'

H. C.

WATERING FRUIT TREES WITH SOAP SUDS.

MA FESSENDEN—If the following facts are worth publishing in your valuable paper, the whole or any part of them are at your disposal. In the spring of 1828, I purchased (as I supposed) a number of English cherry trees, which were in 1830 pronounced by good judges to be Mazzards. As the trees had been set out two years I felt unwilling to cut them down. In August I had them inoculated. Seeing a statement I think in the *New England Farmer*, about that time, or previous, that soap suds was valuable for watering fruit trees, I accordingly began by watering one of my cherry trees. I found in a few weeks the buds, which had been put into the tree began to grow, and continued to grow until the frost came; while the buds in my other trees remained as they were. I began last spring to water the remainder of my cherry trees, which I continued to do through the summer. I have been well paid for fifteen minutes each week, thus employed. My trees have grown more the summer past than they have for three summers before, and now each tree has six branches, from three to five and a half feet in length, besides many side branches; all growing from what were last spring mere buds. I am satisfied that trees watered weekly with suds, or sink water, may be brought to maturity in half the time that usually occurs.

A CONSTANT READER.

Manchester, Ct. Dec. 15, 1831.

From the American Farmer.

NEW THEORY OF BOTS IN HORSES.

Watkinsville, August 1, 1831.

MA SMITH—Should you think the following of sufficient value, I wish you would have it published in the *Farmer*. A late writer says he has tried all the remedies for bots without success. Had he stopped here I should have thought him a person of correct observation; but when he says 'chickens chopped up and thrust down the throat of a horse while warm,' he relies on more than all the other remedies he has tried for the relief of a paroxysm of bots. I conceive prejudice has, even in spite of himself, got the better of his judgment. Also, when he says, 'hickory ashes and salts, given twice a week, is a preventive,' judgment gives way to old prejudice. I say all horses have bots, more or less, at particular seasons; that the most healthy and fat horses have them most abundant; that they never kill or injure horses; and that there is only one way to reduce them, which is to starve the horse, and use him badly, till he

becomes very poor. I now give you my reasons for saying so. Those who have dissected many horses know, that poor horses never have near as many bots as fat ones; this is a fact that none can dispute, who have experience. Hence I say, make a horse poor and you have a certain means of diminishing the quantity of bots. I have never known a horse out of use, in a pasture, said to have died of bots; this I believe no one will dispute. Almost all the horses said to have died of bots, were fat, well kept horses, in use. This I believe will also be acknowledged. Now, when we come to the real truth, very few, and I believe not one horse ever has died of bots; the death which cholera caused, is put upon a very harmless insect, and which is, doubtless, necessary to the health of the horse. It is said that dissection proves death to have been caused by bots, because the bowels are found perforated. It is not more certain, that rats will never eat a hole through a vessel at sea below water mark, than that bots will not eat a hole through the bowels of a living horse. If what I state as fact will not be taken as such, what I relate will prove it. A very fine saddle horse had the humerus dislocated; I purchased him for a trifle several weeks afterwards, thinking I could reduce the dislocation. The animal, otherwise, was in good health; he was bled till he fell; I then with ropes and other contrivances put the joint in place. I never saw a horse bled so much before he fell; he got up and walked a few steps, and fell dead. I had him opened immediately, and found a great many bots; and the part where they were most abundant very much perforated; some appeared to have just begun to eat, and some had gone about half through. My brother's race horse killed himself leaping over a fence; he was the best horse I have ever seen, and very fat. A few hours after, he was opened and found to be very full of bots, and the parts nearly eat up. Now the fact is, that the bots while the horse is living, never injure him; but so soon as he is dead, they begin to eat wherever they are, and very quickly make the punch or gut into a honey comb. Hence, when cholera kills a horse, his death is sudden, and his bowels being filled and perforated by bots, he is thought to be killed by them. Some years ago, a gentleman drove up to the tavern where I was, about mid-day, in the heat of summer; he had a very fine pair of greys—the horses were taken out and put in the stable; but before they were fed his boy came to inform him that one horse had the bots. I went to look at him; he had all the symptomatic horses generally have when thought to have bots; I begged to be allowed to prescribe; but a horse doctor's prescription was more valued; accordingly, a chicken's bowels were forced down the throat, the horse rapidly grew worse; another horse doctor told of wonders he had done with coppers; accordingly the horse was drenched with that. In a little time the other horse was taken the same way; the symptoms were exactly similar. I now again offered my services, stating to the gentleman, that as both horses were fed alike, drove alike, &c., it was reasonable they might both be taken with cholera, at or near the same time. While examining this horse and arguing the case, news came that the first one was dead. The last one was now given up to my direction; he was bled till he fell, one ounce of laudanum poured down his throat, and his flanks well rubbed; in a little time he was well—the dead horse was now opened, and as I expected, many bots were found, and his

bowels perforated. To convince this gentleman more fully, I now repeated experiments I had tried before. Twelve two ounce phials had bots put in them; one had milk put in it, another water another nothing, as a standard; we then filled the others with a strong solution of copperas, a solution of arsenic, aqua fortis and water, a solution of corrosive sublimate, &c. Nine of them being filled with such things as were thought to be most likely to kill them. The arsenic, copperas, and aqua fortis, appeared to have no effect on them; they appeared fully as contented as those in the water. Those in the laudanum, however, moved less than the others, remaining apparently dead at the bottom of the phial, but moved when touched; after keeping until we were all satisfied that nothing that a horse could take would injure them, they were all thrown away. But how comes it that the bowels of horses are found perforated by bots? If we recollect the conduct of all insects that infest living animals, we should only expect bots to do as they do; after death, worms in the bowels of children crawl out at the mouth and anus very often; lice leave the dead; ticks loose their hold on dead cattle as soon as they die; fleas will not remain on dead dogs or dead hogs—All insects that live on or in animals, endeavor to make their escape as soon as the animal dies; and bots, so soon as the horse dies, endeavor to make their escape by eating a passage out. Or else, knowing the animal is dead, eat a last meal from choice. Will it not appear strange that bots raised in the bowels of a horse, and never using flesh as food, should, all of them at the same time, change their appetite and commence eating his bowels? In horses said to have bots, a common symptom is to bite their sides; this is said in fact to be the best symptom by which to distinguish bots from cholera. Dissection will prove that, some horses that do not bite their sides, are very full of bots; and some that bite their sides do not bite near the place the bots are found.

Now all these facts and many more that I could mention, for I have paid much attention to the disease, convinces me, that bots never injure horses; but that horses in use, fed on dry food, subject to irregularities in exercise, in food, and in drink, are subject to cholera, which often proves fatal. When opened after death, the bowels are found perforated by bots, and death is supposed to be caused by them. But if death occurs at some seasons from any cause, and the bowels are found perforated in the same way, which dissection will prove to be the case, doubts should arise as to the horse being killed by bots. If a horse have the symptoms said to be produced by bots, and be opened the moment of death, and his bowels be not found perforated, it should confirm us in our opinion that bots do not destroy horses; and dissection will always prove this to be fact. Observe, the horse is to be opened the moment he dies, for it is astonishing how quickly they commence eating, after the horse dies. If not opened with this express view, we shall always be too late. I had one horse taken in this way; every preparation was made before he died, and as soon as he breathed his last breath he was opened; the bots were found attached to the bowels, but none appeared to have begun to eat; before the bowel could be taken out and carried home, it was perforated like a honey comb. Now, if, as I have stated, which any person can try, the bot lives apparently contented in arsenic, copperas, aqua fortis, &c., &c., what hope can we have that the

horse's stomach can bear anything that will injure bots? Some even think that melted wax can be poured down the throat of a horse, and hold bots fast when it cools; can any person think a horse's bowels could bear wax melting hot without killing the horse, or that it would not cool before it reached the bots? The fact is, stabled horses at particular seasons, discharge bots without taking anything. I have several times found them in the stable when nothing had been given, and at those seasons when medicine is given, bots are found, if examination is made, and they will be found if examination is made when no medicine is given. Any person that will try experiments, often repeated, will come to the conclusion that we know of nothing that can be given to a horse that will destroy or even disturb the bots. If I could depend upon anything from the experiments I have tried on living bots out of the horse, it would be to supply them with laudanum, and then give brisk cathartics.

But how to come to the treatment: a horse is taken with a violent choleric, rolling on the ground biting his side, sometimes much swollen, and other times little or none; apparently in great pain. It is pronounced a case of bots, and while we are preparing chicken bowels to cram down his throat, solutions of copperas, &c., &c., to destroy the bots, the animal dies with choleric; an hour or so afterwards he is opened and his bowels found perforated by bots; we are satisfied he died from bots, without reflecting that these same bots were in him yesterday; that some cause more than mere worms in them must have caused them all to change their appetite so suddenly; that if they really did cause the death of the horse there would be no preventive, as experiment would prove that nothing as yet known would disturb them before they would have time to kill the horse; and whether they might not have commenced perforating the bowels after the horse died. One experiment by opening a horse before he was fully dead would convince all that bots were not the cause of death. The proper way to treat the horse would be to give an ounce of laudanum as soon as he is taken; then bleed until he fills; while down give two quarts of castor oil and rub his flanks hard and continually; if he is not swollen he will be almost certain to recover; but if he swells very much and becomes unable to rise, as a last resort fearlessly plunge a long bladed knife into his flank just where there is a curl in the hair; much air will escape at the wound, and in most instances the horse will be better immediately. It is probable, if this operation were performed sufficiently soon and boldly, it would seldom fail.

R. R. HARDEN.

From the New York Farmer.

USE OF THE TOMATO

IN QUICKENING THE ACTION OF THE ABDOMINAL VISCERA.

MR FLEET—Like most persons of studious or sedentary habits, I often find myself more or less incommode, and my health impaired, by inaction, of the stomach and bowels, so as to be under the necessity of resorting to medicine, principally cathartics. In order to enable your readers perfectly to appreciate what I am about to say of a remedy, this state of the bowels is always in some degree accompanied with a sense of straitness of the chest, and besides a general uneasiness, and

lassitude, yet with the head ache, or some degree of pain in the region of the liver. It seems to me a recurrence of those symptoms that accompany attacks of what is called, by my physicians, a liver complaint, to which I have been a good deal subject. The appetite, instead of being keen becomes imperfect, with a peculiar taste of the month, as if something was wanting, and in the functions of digestion, to constitute perfect health, for which cathartics are only a temporary relief not a remedy.

The common Tomato, used in making gravy, at once removes this taste of the month; in a little time quickens the action of the liver, and of the bowels, and removes all the above noticed symptoms and feelings. I regard it as an invaluable article of diet, or, if you please, as of medicine, or of medical dietetics. With me, it has always been an object of solicitude, to find out such diet, as should supersede the necessity of medicine. Except in pickle, which I cannot use, I eat the Tomato in every imaginable mode of dressing, and find it perfectly adapted to my wants. In the hope of being some use to others, these facts are stated. The Tomato is of great use to me. It is raised with less trouble than any other vegetable that I have any knowledge. It was first planted six years ago, drops its own seed into the ground, and has produced bushels, every year since, with no other trouble than once digging the same ground, in spring, and one or two hoeings, on a spot of perhaps six feet square. It makes a good pickle, and is raised with one hundredth part the care, labor, and trouble, of an equal quantity of cucumbers. But, one other object, remains to be stated. I incline to the opinion, though without having yet fully tried it, that the Tomato may be made into a rich sauce, for meat, and be kept through the year, or from season to season of the fruit.* The gravy, I know, even in the hottest weather of summer, will keep, perfectly unchanged, for several days, in a common open dish, in a pantry; and this I know, because, as my cook does not like the article, I have contrived to keep it over, when she neglects my directions. If properly prepared, and bottled, and well corked, it would certainly keep good, in an ice house, or perhaps in a common cellar, or under water, of a low and uniform temperature. At any rate, if found to be as useful to others, as it is to me, it will be quite desirable to find out how it may be best preserved for use. As a pickle kept in brine, or vinegar, I could not use it, and I am inclined to think its good qualities would be much diminished, for any one, by this mode of preservation. It seems to me, that, of all the articles of diet, or medicine, that have come to my knowledge, the Tomato acts most directly upon the liver, and thus in the bile. Publish this if you please, and let others try it, and make their own observations. I know that several persons, of my acquaintance, have derived alike benefits from the use of it.

Constitutionally predisposed to a torpor of the liver, and the abdominal viscera, I have, through life, been subject to the necessity of using cathartics, until having discovered the good effects of the Tomato. In all cases, except in such as above described, my flow of animal spirits have always been uniform, rather abundant than otherwise,

* French cooks have a method of preserving them in the form of cakes first having cut them into small pieces, or ground into powder.

sustaining severe mental effort, even to 12 and 16 hours each 24, for weeks in succession, always without other stimulant than ordinary food and drink. Wine never exhilarates, except as it increases my general health; and ardent spirits always depresses the tone of my mind. How far they may be regarded as peculiarities, I know not, but think proper to state them, for the sake of a clear understanding, and in a sincere desire to be useful to others. I have never known the effect, even in the slightest degree, of any sort of intoxicating drinks. Health exhilarates, and ailments depress my spirits. When afflicted with inaction of the bowels, head-ache, a bad taste of the month, straitness of the chest, and a dull and painful heaviness of the region of the liver, the whole of these symptoms are removed by Tomato sauce, and the mind, in the course of some few hours, is put into perfect tone, like a new violin. The facts certainly merit a narration, and I can but hope they may be of use to many persons. The true plan of life for men of mind, and especially for men of study, and much mental effort, is, so to live, as to have our food supply all that is necessary of medicine. A wise man will soon learn to relish what agrees with his temperament, and reject all else, in food and drink. To which I will only add, that much employment of the mind, particularly in men of slow habits of the body, slow actions of the bowels, calls for a larger proportion, than they generally use, if temperate men, of liquid food or drink.

H. G. S.

October 23, 1831.

Domestic.—Export of Domestic Cotton Goods from the United States, for

1826, amounting to	\$1,138,125
1827, do	1,159,414
1828, do	1,010,232
1829, do	1,259,457
1830, do	1,343,183

—besides the goods which have been consumed in the Mexican trade, and those smuggled into Canada.

'Practice Laughs at Theory.'—The New York Journal of Commerce says—three thousand bags Brazil coffee were sold yesterday at 12 cents, deliverable on the reduced duty of 1 ct. lb.

That is—the duty will be only one cent per lb., but last year, when it was five cents, the average price of coffee was only 11½ cents—so a reduction of the 'tax' has increased the price. The duty instead of being kept in the country, really goes into the hands of the foreign grower who graduates his prices with reference to the duties, &c., here. This is sound 'free trade' logic, though common sense rejects it—as it does the whole doctrine.—Niles' Register.

'A Curiosity.'—A friend has placed in my hands (says Niles' Register) 'The Calcutta Gazette and Daily Advertiser' of 27th May, 1831—which among other widely spread advertisements, contains the following.

'Mazkenzie Lyall & Co. will sell by public auction at the Exchange Commercial sale rooms, this day, Friday, 27th May, 1831, ten bales fine American sheetings, bleached and unbleached, as fully detailed in the catalogues now in circulation.'

Steam engines are made in Pittsburg for less than half the price paid for them in 1818, and cheaper than they are in Liverpool and Manchester.

From the Journal of Health.

CAUSES OF DISEASE.

The causes of most of our diseases, or at least of that numerous class which it is in our power entirely to prevent, may be enumerated thus:

1. *Insufficient Exercise.*—He who does not spend several hours every day in some active exercise—as walking, riding on horse-back, or in some amusement which calls nearly all the muscles into play, must inevitably suffer from a diminution of bodily strength, defect of appetite, and imperfect digestion, and become sooner or later the subject of disease.

2. *Late rising and late retiring.*—There are few things which contribute more to shorten life, than the habit of keeping late hours, and consequently of rising from bed late in the morning. The advances of weakness and disease from this cause are, it is true, by very gradual steps, but not the less certain to be ultimately felt.

3. *Breathing impure air.*—A constant supply of fresh air is even more important than of food or drink. An individual may, for a long time, control the sensation of hunger, or even the more imperious one of thirst; but life will most certainly be destroyed, if pure air be withheld from the lungs for a very short period. The air is rendered impure by being loaded with animal and vegetable exhalations, by its free circulation being prevented by a number of persons breathing it when confined in a close chamber, and by the processes of fermentation and combustion.

4. *Insufficient ablutions of the body.*—It is not enough for the preservation of health, that merely the hands, the feet, and the face be washed frequently, but that the whole surface of the body be repeatedly purified, by immersion, in a bath of appropriate temperature. To all the frequent use of the bath is an important means of preserving health, but to none more so, than to the laborer and mechanic: to such the time and means for bathing should be afforded in every city, and in every extensive manufactory, wherever situated.

5. *Inattention to the cleanliness of clothing and dwellings.*—Independently of the injury which the health of individuals suffer from a neglect of strict personal and domestic cleanliness, the contamination of the air, from the decomposition of filth, accumulated in and about a dwelling, has not unfrequently communicated disease to whole families and neighborhoods. Repeatedly white-washing the walls of a house, and scrubbing the floor, is not merely, therefore, a source of tasteful comfort, but a direct means of preserving health.

6. *Food rendered pernicious by modern cookery.*—*Adulterations in foods and drinks, and abuse of appetite.*—While a moderate quantity of plain, wholesome food—in other words, the food in ordinary use, is essential to the maintenance of life—all excess in its use—all complicated processes of cookery, and every artificial means, whether by high seasoning, variety of dishes, or foreign flavors, of keeping up the appetite beyond the wants of the system, are decidedly injurious. Every species of adulteration, also, to which our food or drink is subjected, from whatever motive, detracts from its wholesomeness. Let it be recollected, too, that the health and strength of the body are not supported by the quantity of food consumed, but only by so much as is capable of being converted, by the powers of the stomach, into pure chyle and blood.

7. *The use of intoxicating drink in any quantity.*—The only wholesome drink, the only one adapted to the wants of the system is pure water. Every drop of alcohol which is taken into the stomach, whether in the form of ardent spirits or fermented liquors, produces injury; and when its use is habitually indulged in, even though absolute drunkenness be not occasioned, the powers of life are gradually undermined, and the system laid open to the inroads of serious and even fatal diseases.

8. *Defective and improper clothing.*—Injury to health may be caused either by the clothes being inadequate to defend the wearer from the cold, or from sudden changes in the weather, by their impeding the free motions of the limbs, or by their compressing or binding too firmly some part of the body.

9. *The influence of cold.*—In the more opulent ranks of society disease is produced occasionally by the unequal and imperfect diffusion of warmth throughout an apartment—by exposure to the night air or inclement weather, after being heated in crowded apartments, or by exercise; as dancing, &c. In the poorer and improvident classes, cold, during winter, is a continued and fruitful source of suffering and disease.

10. *Intense and protracted application of the mind.*—Alternate rest and activity, as well of the body as of the mind, are essential to the support of health. Long continued mental application, whether in study or the cares of business, wears out the system, and exhausts the powers of life even more rapidly than protracted manual labor.

11. *Giving way to the passions.*—Experience fully proves, that nothing contributes more effectively to guard the system from disease, and to prolong life, than a calm and contented state of mind. Individuals who give way on every occasion to the influence of passion not only injure materially their health but are often promptly destroyed. Violent anger and ambition, jealousy and fear, have produced the speedy death of thousands. In cultivating an amiable, peaceful, and virtuous disposition, therefore, a man not only insures his happiness but promotes his health also.

12. *The unnecessary or imprudent use of medicine.*—Domestic quackery has ruined many constitutions. A dose of medicine taken with the view of preventing an attack of disease, not unfrequently invites one which otherwise would not have occurred. The absurd practice of losing blood, or taking purgatives and other remedies in the Spring and Autumn, under the erroneous idea that by so doing the blood is rendered more pure, should be carefully avoided.

From Foster's Health Almanac.

DIETETIC MAXIMS.

1. A healthy appetite is to be acquired by early rising—regular exercise in the open air—a cheerful mind, and abstinence from intoxicating liquors.

2. The food should be eaten slowly, so that it be well masticated and mixed with the saliva.

3. Animal food is sooner digested in the stomach than vegetable; but it is more stimulating or heating to the system. Flesh that has been long salted, dried hams, beef, &c., are less nutritive than fresh meat.

4. Farinaceous and vegetable food, generally, is slower of digestion than animal, but it is less

heating—many kinds of vegetable food are very nutritive.

5. Solid food, or food of a certain fibrous or pulpy consistence, is more fitted for digestion in the stomach than rich soups, jellies, and all highly concentrated sauces.—The latter are rendered more digestible by the addition of bread.

6. Fish are not so nourishing as the flesh of land animals, and with many stomachs entirely disagreeable. The white fish, when in season, are generally lighter, and less apt to disagree with the stomach than the red.

7. In summer the food should consist principally of vegetables; in winter, a larger amount of animal matter may be taken, especially by the laborer.

8. Boiling renders food more tender and digestible, but it deprives it of a considerable portion of its nutritive principle.

9. Animal food should not be over-boiled—vegetables should be boiled until perfectly tender.

10. Roasting dissipates less of the nutritive parts of the meat. Roasted meat is therefore, more nourishing than broiled, but much more stimulating.

11. Bread constitutes a wholesome addition to all our meals. It should be perfectly raised, fully baked, and one day old.

12. Salt, and on occasions, a very moderate quantity of pepper are safe and grateful additions to our food. Beyond this, however, all seasoning becomes injurious.

13. Eating of a number of different dishes at one meal, oppresses the stomach and interferes with digestion. This is not to be understood, however, as condemning the proper admixture of animal and vegetable food at the same meal.

14. All excess in eating should be avoided, but the quantity of food proper to be taken at one time depends entirely on the constitution, age, habits, degree of health, season of the year, climate, &c. The best guide is to be found in the calls of a healthy appetite.

15. Health, and strength of body, depend upon the health of the stomach, and consequent perfection of the digestive powers, much more than upon the quantity or even quality of the food taken.

16. Water is the most wholesome drink. Toast and water—sweetened water, or water with a slight addition of a vegetable acid, are useful diluents during the summer.

17. Distilled and fermented liquors impede digestion; and when drunk to any extent, invariably destroy the tone of the stomach, and of the system generally.

18. The stomach ought not to be over-distended with fluids during, immediately preceding, nor after a meal.

19. When the stomach is weak, very little fluid should be taken during or after eating. Dry solid food requires more dilution than that which is juicy or fluid.

20. Exercise should be used in the intervals between meals, but not immediately before or after them.

CLEANLINESS.

The author of 'Journal of a Naturalist,' speaking of insects, says,—The perfect cleanliness of these creatures is a very notable circumstance, when we consider that nearly their whole lives are passed in burrowing in the earth, and removing

nuisances; yet such is the admirable polish of their coating and limbs, that we very seldom find any soil adhering to them. The meloe, and some of the scarabaei, upon first emerging from their winter's retreat are commonly found with the earth clinging to them; but the removal of this is one of the first operations of the creature; and all the beetle race, the chief occupation of which is crawling about the soil, and such dirty employs, are notwithstanding remarkable for the glossiness of their covering, and freedom from defilements of any kind. But purity of vesture seems to be a principal precept of nature, and observable throughout creation.—Fishes, from the nature of the element in which they reside, can contract but little impurity. Birds are uneasingly attentive to neatness and lustration of their plumage. All the slug race, though covered with slimy matter, calculated to collect extraneous things, and reptiles, are perfectly free from soil. The fur and hair of beasts in a state of liberty and health is never filthy, or sullied with dirt. Some birds roll themselves in dust, and occasionally, particularly beasts, cover themselves with mire; but this is not from any liking or inclination for such things, but to free themselves from annoyances, or to prevent the bites of insects. Whether birds in preening, and beasts in dressing themselves, be directed by any instinctive faculty, we know not, but they evidently derive pleasure from the operation, and thus this feeling of enjoyment, even if the sole motive, becomes to them an essential source of comfort and of health.

From the Journal of Health.

CROWDED ROOMS.

In an English work, entitled the Philosophy of Medicine, containing numerous extracts on the nature of health and disease, we find the following striking, but as we have, every reason to believe, authentic anecdote.

“A lively young lady, who came to Bath, to put herself under the care of Dr M. Adair, gave a rout and insisted that the doctor should be of the party. The room was small, and the company very numerous. He had not been long seated to the card-table, before a young gentleman, his partner, fell into a swoon. The doors were immediately thrown open to afford him fresh air, and the sash lifted up and both the gentleman who swooned, and the young lady, Dr Adair's patient, who were invalids, were much injured by the sudden exposure to a current of cold air. How the rest of the company were affected, says Dr Adair, I had no opportunity of knowing; but my own feelings and sufferings, for many hours after I retired from this *evening* convinced me of the dangerous consequences of such meetings. On declaring, a few days after, to one of my brethren, a man of humor, my resolution of writing a little philippic against routs, he archely replied: “Let them alone, doctor; how could this place otherwise support *twenty-six* physicians?”

This fact, says our correspondent, to whom we are indebted for this article, serves to show, better than a thousand arguments without it, the danger of injury from confined air in close apartments. Hence we see that when we invite our friends to enjoy with us the pleasures of the social circle, we may incontinently be the means of rendering both them and ourselves miserably, by the poison of a corrupted atmosphere. Besides, how

often do we find hundreds, and thousands, of individuals occupying a room with closed doors and windows, for an hour or two together! Much of the yawning, and dullness, and inattention of religious assemblies, is often produced by similar causes, though usually ascribed to a different origin. Crowded assemblies would do well to recollect that they are rendering the atmosphere absolutely poisonous, at the rate of at least a gallon a minute or a hoghead an hour to an individual; and they are making it more or less impure and unwholesome with every breath. This happens too when the atmosphere is the most pure and dense. In hot weather, as the air is highly rarified, and other causes of impurity exist in greater abundance, it is poisoned at a much more rapid rate than in other circumstances; and this should remind us of the necessity of a stricter attention to ventilation.

Our unenlightened readers, may be edified by the following—

RECIPE FOR A ROUT:

“Take all the ladies and gentlemen you can collect, and put them into a room, with a slow fire. Stew them well. Have ready twelve packs of cards, a piano-forte, a handful of prints or drawings, and put them in from time to time. As the mixture thickens, sweeten it with politesse, and season with wit, if you have any; if not, flattery will do, and is very cheap. When all have stewed well an hour, add some ices, jellies, cakes, lemonade, and wines; the more of these ingredients you put in, the more substantial will your rout be. Fill your room quite full, and let the steam run off!”

FAT CATTLE.

It is impossible to ascertain at what time the people on Connecticut river began to fatten oxen in the stall for the Boston market. The first notice on record, that we have observed, is a vote of the town of Hatfield in August, 1703. In taking the list in the spring preceding, fat cattle were included; this, it seems, was a subject of complaint, because the cattle were driven to market soon after the list was taken; the town therefore voted not to include them. It is evident from this vote that a considerable number of oxen were stall-fed in Hatfield at that time.—The business must have been commenced in that and other towns some years before—probably as early as 1690, or 140 years ago. The first notice in Northampton is in the inventory of the estate of Nathaniel Dwight, March, 1712; it includes four fat oxen, besides several yokes of working cattle. After this, fat oxen in the spring are noticed in Hadley, Deerfield, Westfield, &c. In 1724, three fat oxen belonging to the estate of Benjamin Lyman, Northampton, were appraised at 12 pounds each. In February, 1729, Samuel Clark, (father of the late Benjamin Clark) sold six fat oxen for 20 pounds each; and in March, 1730, his neighbor John Baker, sold six oxen at the same price. In March, 1732, Jonathan Strong, John Miller and Joseph Hawley, (father of Maj. Hawley) sent each a yoke of cattle to Boston. Mr Hawley's oxen brought 45 pounds, and the others a less price. In March 1729, Doct. Thomas Wells of Deerfield went with a drove of fat oxen from Deerfield to Boston; he was gone 10 days, charged 4l. 15s. for his expenses and services. The money in circulation at that period was a depreciated paper currency, called bills of credit. The 45 pounds for which Mr Hawley's cattle were sold was not probably worth more than 45 or 50 dollars in silver. We are

thus particular, in order to show that stall-feeding cattle was a business of some importance in the towns on Connecticut river more than 100 years ago. It has been much extended since, and it is believed that the farmers of Hatfield now stall-feed three times as many oxen as were fattened in all the towns in Old Hampshire 100 years since.

In 1731 there were only eleven towns in the county of Hampshire, viz. Springfield, Northampton, Hadley, Hatfield, Sunderland, Westfield, Deerfield, Northfield, Brimfield, Southfield and Enfield; the two latter are now in Connecticut. There were settlements at Cold Spring (Belchertown) the Elbow (Palmer) and some other places.—*Hamp. Gazette.*

Canker in Fruit Trees.—A paper on this subject has been read before the Caledonian Horticultural Society, by Mr Peter Campbell, gardener at Coalston, in which this experienced gardener gives it as his opinion that the cause of canker in fruit trees is a stintedness of growth that takes place from a bad subsoil, and the ground not being properly prepared before the fruit trees are planted. An experiment he has tried proves he says, to be an effectual cure for that disease, so far as he has hitherto experienced. There were upwards of seventy espalier fruit trees taken with canker, that had entirely given up bearing; twelve of them had only been about twelve years planted. The soil these trees grew in was of a sandy nature, and was formerly a bog full of springs, with veins of black sand about eighteen inches below the surface. By examining the roots that went down into these veins of black sand, they were found to differ from the other roots, and some parts were quite swelled and overgrown, compared with other parts of the same root, so that it had more the appearance of a tuberous than a fibrous root, and the wood itself was very seriously injured in the interior. He instantly proceeded to clear away the soil from the roots, with care so as not to injure them, first to the distance of three feet from the trunk of the trees all round, and afterwards as much under the trunk as could be got out; he cut off the tap roots that went right down, and also all the roots that were diseased, and proceeded to clear away the soil another foot round the tree; a layer of bricks &c. being laid on the bottom, he then filled up the hole with good mould mixed with rotten cow dung, beating in every course below the trunk of the tree with a beater made for that purpose. He then proceeded to prune off the tops of the trees, not leaving a branch nor bit of wood that had canker in it on any of the trees. By this treatment, he says, the trees are become quite healthy, and free from any moss or lichen, and without the least appearance of canker.

To destroy thistles, fern and coltsfoot.—Having once a pasture field, says a correspondent in the English Country Times, that seemed one entire bed of common thistles, and having occasion to carry manure across it to another field, I observed all the thistles completely killed wherever the carts went; I therefore set to and rolled the whole field with a cast iron roller, once in the latter end of May; and twice in the beginning of June. The field has been free from thistles ever since. The expense was only 35s. per acre. Fern and coltsfoot I have exterminated in the same way.

NEW ENGLAND FARMER

BOSTON, WEDNESDAY EVENING, DEC. 21, 1831.

REPORT ON BUTTER.

As a few inaccuracies occurred in the table of entries for the premiums on Butter as published in our last, we have been desired to republish it, by the chairman of the Committee, who drew up the Report.

No. 1	Sanford Howard,	Hallowell, Me.	6 firkins.

68	Stephen Metcalf,	Croydon, N. H.	6 do.

In addition to which there were a great many applications from individuals, who not having complied with the regulations of the Society, could not be allowed to come in competition for the premiums.

For Cheese there were eighteen entries, viz. 1 from Maine, 1 from New-Hampshire, 2 from Vermont, and 14 from Massachusetts.

AGRICULTURAL CONVENTION.

A convention of delegates is called in the New York papers to meet in the city of Albany on the 14th of February, 1832, to be composed of individuals engaged in agriculture from the various counties of the state, for the purpose of forming a State Agricultural Society.

Edinburgh Review—Lilly and Wait have just republished the 10th No. of this able journal, which contains articles on the following subjects: Croker's Edition of Boswell's Life of Johnson—Greek Philosophy of Taste—Southey's uneducated Poets—Tones in the Theory of Rent—Public Amusements: Pretensions of the Evangelical class—Moore's Life of Lord Edward Fitzgerald—Crombie's Natural Theology—Life and Writings of Fuseli—Rossi on Criminal Law—State of Protestantism in Germany—House of Lords: Reform.—Published quarterly at \$5 per annum.

Hops.—A petition is before the Legislature of Lower Canada, from certain Hop-Growers, for an additional duty on foreign [United States] Hops imported.

At an adjourned stated meeting of the Massachusetts Horticultural Society, held on Saturday, Dec. 17th, 1831.

The following seeds presented to the Society by J. R. Van Zandt, Esq., of Albany, (an honorary member of the Society,) were distributed, viz :

- No. 1. Large Drumhead Lettuce.
2. Sugarloaf Head, do.
3. Smooth Musk Melon, the inside green and thick—name not known.
4. Pine Apple do.
5. Rock do.
6. Green Minoreca do.
7. Citron do.
8. Nutmeg do.
9. Green Flesh do.
10. Pine Apple do.
11. Water Melon.
12. do. do.
13. do. do.
14. do. do.
15. do. do. Huling Red Core.
16. White Solid Celery, none better in the country.
17. Water Melon, large, 3 feet 8 inches long.
18. Purple Cape Broccoli Cabbage.
19. Dark Striped Crooked Neck Winter Squash.
20. Yellow do. do.
21. do. Straight, do. do.
22. Peruvian Coconut Squash, very sweet.
23. Valparaiso do.
24. Bush do.
25. White Spine Cucumber.
26. France do. 22 inches long.
27. Tomatoes, superior kind.
28. Egyptian Barley, 2 crops in one season, very valuable.
29. Rensselaer Prem. Potatoes, 2 crops, small round White.
30. do. do. do.
31. Albany Prem. do.
32. Pure Sweet Corn.
33. Large Corn, equal to sweet.
34. Very Early Corn.
35. Pop Corn.
36. Very fine Early Kidney Potatoes, Long Black.
37. Seek-no-farther Potatoes, Large White.
38. White Prolific Bush Beans.
39. Orange Cayenne Pepper.

FLOWER SEEDS.

40. Double Hollyhock, mixed colors.
41. Marvel of Peru.
42. White Candytuft.
43. Chrysanthemum.
44. Dwarf Virginia Sun Flower.
45. Purple Lavatera.
46. Large Purple Zinnia.
47. Hyacinth Beans, or Flowering Beans.
48. White Lavatera.
49. Perennial Bee Larkspur.
50. Hibiscus Syrian Mallow.
51. Ipomea, Cypress Vine.
52. Sweet Williams, fine colors.
53. Red and Yellow Cockscomb.
54. Centaurea Cyamus.
55. Fumaria Vine or Wood Fringe.
56. Rose and Variegated Double Balsam.
57. Cacha Cocinea or Tassel Plant.
58. Zoranthemum, Eternal Flower.
59. Golden Coreopsis.
60. White and Purple Snap Dragon.
61. Blessed Thistle.
62. Sea Beach Hibiscus.

J. R. VAN ZANDT.

Capt. Martin Burridge, of Medford, was admitted a member.

FRUITS.

A box of Apples was received from James E. Mifflin, Esq., of Wrightsville, Pa., of the variety called *Winter Sweet Paradise*. This fruit is of large size, pale yellow, with a fine bluish, juicy, and possessed of very rich flavor. We know of no sweet apple, in eating at this season, that is better; a letter from Mr. Mifflin is annexed, who it may be re-

collected a few years past kindly forwarded scions to the Society for distribution, which are now growing in this neighborhood, but have not as yet, we believe, shown fruit.

Per order of the Committee.

E. VOSE, Chairman.

Wrightsville, Nov. 13th, 1831.

To the Honorable H. A. S. DEARBORN, President of the Mass. Hort. Society, and the Gentlemen of the Fruit Committee.

Having in a communication with one of the gentlemen connected with the New England Farmer establishment, some time past, mentioned my intention of sending a sample of the Winter Sweet Paradise apple for the use and information of your Society, and which by an opportunity to Philadelphia I am now able to do, I have therefore to request your acceptance of 15 apples of that kind, which accompany this, and that you will after trial give your opinion of the fruit through the New England Farmer (in one of the volumes of which said apple is described,) making proper allowance for their being more dry than usual, owing to having laid 5 or 6 weeks on a garret floor, and being otherwise exposed in the packing and carriage. Here, with many people is a prejudice against sweet apples, which, judging from some descriptions in Thacher's Orchardist and Fessenden's New Gardener, may not be the case with you. I have twice forwarded grafts of this kind to Boston, some of which, most likely, have taken; therefore, after an examination of the fruit you will be enabled to judge whether to extend or drop their cultivation. I have observed that in appearance they vary much, the most showy fruit being grown on high thin land, while the size is increased on rich bottom lands, with a more dull appearance in color. Acclivities with shaly or gravelly soil, of tolerable strength and southern exposure, I should think favorable to their production in high perfection.

Wishing success to the undertaking of your Society, I am your friend,

JAMES E. MIFFLIN.

FLOWERS.

Mr Haggerston, of Charlestown, exhibited a beautiful bouquet of flowers, consisting of Noisette and Tea Roses, Indian White, Straw colored and Pink Chrysanthemums, and Brown, purple Chinese Chrysanthemums, Primula, &c.

A contract for building four or five miles of the Boston and Lowell Railroad, commencing at Concord River in this town and extending south, has been made by Mr Livingston, one of our enterprising citizens. Other contracts, we understand, have been extensively made;—as soon as the spring opens the work will go on along nearly the whole extent.—*Lowell Journal*.

It is in contemplation to construct a Rail Road from New London to Providence, to intersect the road contemplated, to run between Providence and Boston.

The Editor of the Providence Daily Advertiser has received a second crop of Apples and a third crop of Blossoms, taken from a tree in Cumberland, R. I. The tree after bearing and bringing to maturity one crop, blossomed the second time, during the second week in September, and for the third time about the second week in November.

In consequence of the high price of wood, the Baltimore and Ohio Rail Road Company have made arrangements to bring 200 cords of wood daily to Baltimore, to relieve the poor.

New England Magazine.—We have already published in our advertising columns, the table of contents of Buckingham's New England Magazine, No. 6, and we have had pleasure in giving our readers a taste of those contents by several valuable extracts from the work. The work was undertaken with a view to try the market with a staple article of home production—and that justice might be done to all, it was determined to issue the work for one year; one half the time has expired, six numbers have been regularly published, and each successive number has evinced a decided improvement in the quality of the contents. The cause is obvious—the work has acquired a character, and good writers covet the New England Magazine as a medium for their productions, and we think a discriminating public will likewise covet the Magazine for the same productions.—*United States Gazette.*

The farmers of Maine are still troubled with Bears and Wolves; 150 sheep have been killed in Oxford county. Five Wolves and several Bears have been caught.

The following is from the Montreal Gazette on the 12th inst. "We have used the Liquid Gas and find it resembles the coal Gas so strongly as to render it impossible to discover any difference by the eye. The Liquid Gas possesses many advantages over oil. It emits no smoke, causes no disagreeable smell, can be increased to any degree of intensity without causing smoke or putting the wick out of order; all of which difficulties are experienced in the use of oil.

TO CORRESPONDENTS, &c.

We have received by the kindness of Z. COOK, Jr., Esq. a copy of the Address pronounced before the Massachusetts Horticultural Society, in commemoration of its third Annual Festival, by Malthus A. Ward, M. D. and shall soon favor our readers with the whole, or selected parts of this excellent performance.

We have also been favored, by the kindness of his Excellency Gov. LINCOLN, with a copy of the Address delivered before the Worcester Agricultural Society, October 20, 1831: being their thirteenth Anniversary Cattle Show and Exhibition of Manufactures. By OLIVER Fiske, M. D. This is an able, useful, and entertaining document, and we shall be happy to make our columns instrumental in extending the sphere of its circulation.

Mr Cheney's Address before the Society of Middlesex Husbandmen and Manufacturers, at their last meeting, together with an Address before the Hampshire, Hampden and Franklin Agricultural Society, by Samuel F. Dickinson, were received just as our paper was going to press. We have not had time to peruse them.

We shall soon have the pleasure of presenting our readers a list of about 100 of the best pears, to contain all the Synonyms, and a pretty full description of the fruit, sufficient to enable one to identify any particular variety, by that judicious cultivator, Judge BUEL,—to be followed by similar tables of other fruits.

Several favors from our esteemed friend H. C. and others will appear next week.

The New England Farmer will be printed on new type and better paper, next month.

Pear Seeds.

For sale at the Seed Store connected with the New England Farmer Office—

One bushel of fresh Pear Seeds of excellent quality.

Grape Vine Cuttings.

Several thousand cuttings of the Catawba, Schuykill, Muscadell, and Constantia Grape Vines, will be for sale at John Adlin's, Georgetown Vineyard, near Washington city, from now till the first of April next.

Dec. 21.

Map of New England.

WITH CORRECTIONS TO THE PRESENT TIME.

A few copies of this map, lately printed, with corrections, containing all the new incorporated towns, with the principal roads, &c. are now uni-held, mounted on rollers, and folded in cases for travellers—and for sale, at the Counting Room of the Daily Advertiser, 6 and 8, Congress street, and at the Book-stores. Dec. 21.

Sir Thomas Browne's Works.

HILLIARD & BROWN, Book-sellers to the University, Cambridge, have this day published—The Library of the Old English Prose Writers, Vol. III., containing the Miscellaneous Works of Sir Thomas Browne, with some account of his life and writings. Edited by the Rev. Alexander Young. This volume contains the whole of 'The Religion of a Physician,' treatise on 'Urn-Burial,' the Letter to a Friend on the death of his intimate Friend, and selections from the 'Vulgar Errors.'

H. & B. have a few copies remaining of the first and second vols. of this collection, containing Fuller's Holy State, Sidney's Defence of Poesie, and Selden's Table Talk. Each volume may be obtained separately, neatly bound in linen, or elegantly in calf and gilt. Dec. 21.

Cobbett's Advice to Young Men.

Just received and for sale at J. B. Russell's Seed Store, No. 50½ North Market Street, Boston—

Advice to Young Men, &c., by William Cobbett.

Tea Wheat.

A few bushels of this very valuable variety of spring Wheat is this day received, for sale at J. B. Russell's Seed Store, No. 50½ North Market street, from the vicinity of Lake Erie. Persons in want of it are advised to call soon, as the supply is small, and many were disappointed, in not being able to get the Black Sea Winter Wheat, from the same source. One kernel of this wheat was discovered in a chest of tea in St John, New Brunswick, in 1823, from which the present variety has been disseminated. See N. E. Farmer, vol. ix, page 105—and vol. vi, page 82. Dec. 14.

Flooring Boards, &c.

Of hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, Jr, 65, Broad street.

Seeds for Country Dealers.

Traders in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed they can be furnished at the New England Farmer office, No. 50½ North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as they can be procured in this country, nearly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and SWEET CORN, &c. of different sorts.

⌈The seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themselves. Nov. 12.

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street, Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c., which he will dispose of at as low a rate as can be purchased in the city. ⌈Watches repaired and warranted.

BRIGHTON MARKET.—Monday, Dec. 19.

[Reported for the Chronicle and Patriot.]

At market, this day, 1056 Beef Cattle, 196 Stores, 678 Sheep, and 1256 Swine. The Swine have been before reported.

PRICES.—*Beef Cattle*—Last week's prices for the best qualities were well supported, perhaps a trifle better prices were obtained; but barrelling and middling Cattle were not so high. We quote for one yoke, \$5 75, extra 5 25 a 5 50, prime, 5 a 5 12½, good 4 50 a 4 75, thin 3 a 4 25.

Barrelling Cattle—Prices reduced.—we quote for mess 4 a 4 12½; No. 1, 3 50 a 3 62½.

Stores—We noticed but a few sales.

Working Oxen—No sales noticed; a few only at market.

Cotes and Calves—Sales were effected at 20, 23, 25 and \$35.

Sheep—We noticed the price of only two lots, \$2 and 2 25. A lot of wethers were sold—price not known.

Swine—Market full—several hundred have been sold at reduced prices. We noticed one entire lot at 2½c; one lot of 20 selected barrows at 4½; one lot of 20 do. at 3½c. At retail 3½ for sows and 4½ for barrows.

MISCELLANY.

THE ART OF MISEDUCATION.

LESSON I.—How to make yourself odious to children.

RULE I.—You may make them hate you, by treating them unjustly.

Little Charlotte was going out into her father's orchard. It was full of violets.—Oh! cries Charlotte full of joy, 'what beautiful little flowers! I will gather my apron full and make a nosegay for mother.' She immediately knelt down and with great industry gathered her apron full, then she seated herself under an apple tree and made a handsome nosegay. Here it is! said she, 'now I will run and carry it to my dear mother. How she will be delighted to kiss me!' To increase the pleasure of her mother, she crept slyly into the kitchen, took a china plate, put the nosegay on it, and went on a full leap down the stairs to find her mother. But Charlotte stumbled, fell and broke the china plate into a hundred pieces, and scattered her nosegay all around. Her mother who was in the room near by, heard the noise, and immediately sprang to the door—when she saw the broken plate, she ran back, seized a thick rod, and without inquiring a word about the manner in which the plate was broken, came to the child. Terrified, both by the fall and on account of the broken plate, and half dead with fear of the rod, little Charlotte could only ejaculate 'dear mother! dear mother!' But this was of no service to her. 'You little wretch!' said her mother, 'break a beautiful plate—will you?'—and chastised her severely. Little Charlotte was offended when she found herself treated with such open injustice. She did not forget for a long time, and never again brought a nosegay to her mother.

RULE 2.—Take no part in the pleasures of your children, show no feeling in the caresses you bestow on them, and you will soon make them indifferent to you.

An agreeable, married couple had their heads so full of business and enterprises, that they considered every moment lost which they devoted to conversation with their children. The husband was busy with calculations of profit, and the wife was always planning how to maintain their style of living, and increase their articles of dress. Any interruptions from their children were considered as injuring their prospects. If little Nicholas skipped up to his father with his A, B, C book, and said, 'Look, father! the pretty monkey has got an apple in his paw!' he received for an answer, 'Don't disturb me!' He ran to his mother and she sent him away. Then he went with his book in his hand to Sally, the chamber-maid, and she knew how to treat him better—she laughed with him over the monkey, showed him the wolf and the hare, and told him how the wolf devoured sheep, 'and how good roasted hares tasted.' His dear sister Mary treated him in the same way. She knew his secrets, and entered into all his joys. If his father and mother were to journey three months, he would care nothing about it; but if little Mary was absent one day from home he would sob and cry.—*Satan-man.*

A farmer observing his servant a great while at breakfast, said, 'John, you make a long meal.'—'Master,' said he, 'a cheese of this size is not as soon eat as you think of!'

Extraordinary instinct in a Bird.—The Ratel, (an animal resembling the badger) as well as the native inhabitant of the Cape of Good Hope, is sometimes guided in its search after honey, by a little bird, the *Cuculus Indicator*, or Honey Cuckoo, which it seems has sagacity enough to know that both men and beast are fond of the tempting spoil. This little creature, although incapable of storming a hive in its own person, takes advantage of the propensity of others, who are better fitted for the task, and invites the Hottentot or Ratel to follow it by a peculiar note, which they both equally understand. Having thus secured their attention, it flies slowly on before them, alternately halting for them to come up with it, and then taking another flight, still admonishing them by its warning voice, until it arrives at the spot where the hidden treasure is deposited, then it suddenly ceases to be heard, but remains quietly perched on a tree in the vicinity, waiting for a share of the plunder, which it usually receives as a reward for its interested services.

Remains of a Mammoth Spec. found in England.—A lecture was lately delivered to the Philosophical and Literary Society of Chatham, England, by Robert Dodd, Esq. on the jaw and teeth of a Mammoth, and of some other Fossils, found in a Flint quarry, in the neighborhood of that town. After having given an explanation of the different fossils, which had been discovered in that neighborhood, Mr Dodd proceeds to show, that 'a great revolution or catastrophe has completely altered the face of the earth in that part.' And he adds, 'the repetition of the usual phenomena of nature for a thousand centuries would not have produced these effects.' Excepting volcanic phenomena on a large scale, we know of no existing power, he says, capable of producing such effects. The present geological appearances, are such as indicate the action of an enormous and sudden power, operating as great and sudden changes. The cause he believes to be, a power acting from the central regions of the globe, towards its circumference, elevating the strata, and in the focus of its action not only raising, but shattering and loosening them; thus rendering them a prey to the flood occasioned by the convulsion.

Ladies in town and country compared.—City ladies boast of being more delicate than country maidens. The one breathes an air politely with many thousand breaths; the other inhales a breeze freshened over the new mown hay. The one drinks water from the sewer, mingling pump, or through impure pipes from the open horse pond; the other pours it from the moss-covered bucket, or dips it from the pure spring. The one walks over the hard pavements, along the dusty pile of bricks, the other trips over the soft grass along the graceful rows of trees. The one is pale and sickly from watching at the evening concert; the other is ruddy and healthy from rising with the morning birds. The one is the lily of the greenhouse; the other is the rose beside the stone wall. In the city is seen the ingenious and handy work of man; in the country are traced and hallowed the stately footsteps of the Almighty.

Excluding and including.—A wag one day asked his friend, 'How many knaves do you suppose are in this street besides yourself?' 'Besides myself?' replied the other, in a heat, 'do you mean to insult me?' 'Well, then,' said the first, 'how many do you reckon including yourself?'

Animal sagacity.—There is now in the possession of Mr. Cross, of the White Hart Inn, Walscombe, a dog of the French poodle breed, whose sagacity and intelligence are such as to rival the most superior faculty in man. He will fetch any specific sum of money from the till, which he will open and shut himself; and will fetch and replace any article of wearing apparel or other thing that he is desired, from any drawer or cupboard, which he will open and close himself; he will fetch an ottoman and place it in the most proper position for his mistress's feet, with great politeness and much thoughtful examination; he will put boots, shoes, and other litters out of sight upon the slightest bidding, and with a rapidity of movement that would put any domestic to the blush. It is worthy of notice that Philip (his name) is not quite twelve months old, and that he has acquired all his knowledge and usefulness without a beating.—*Bath Herald.*

Two Yankees met in a tavern, and after mutual glances, and a half recognition, advanced to shake hands; yet both hesitated, and neither could call the other by name. Said one of them 'Seems to me I have seen you somewhere.' 'I think it likely,' said the other, 'for I have often been there.'

In the pursuit of knowledge, it is a mistaken idea, that we are not to attend to the daily claims on our attention, of fond endearments, filial and fraternal obligations. He who rises above, or neglects these, will find that the possession of knowledge will only render the savage more to be dreaded.—*Gen. Farmer.*

Cobb's Treatise on Silk.

Just published, and for sale at the Agricultural Warehouse and Seed Store, No 54, North Market street.

A Manual, containing information respecting the Growth of the Mulberry Tree, with suitable Directions for the Culture of Silk—in three parts—with colored engravings. By J. H. Cobb, A. M. Published by direction of His Excellency Gov. Lincoln, agreeably to a Resolve of the Legislature of Massachusetts. Price 37½ cents. Oct. 26.

Ammunition

Of the best quality and lowest prices, for sporting—ready for sale at COPELAND'S POWDER STORE, 6 Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned. J. & I.

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer's office. Aug. 3.

Published every Wednesday Evening, at 25 per annum, (except in the case of the year)—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

Printed for J. B. RUSSELL, by I. R. BUTTS—by whom all descriptions of Printing can be executed to meet the wishes of customers. Orders for printing received by J. B. Russell, at the Agricultural Warehouse, No. 52 North Market Street.

COMMUNICATIONS.

Extract of a letter from a subscriber and correspondent in Macon, Georgia, to the Editor of the New England Farmer.

CULTURE OF THE GRAPE.

I have given more of my personal attention to the cultivation of the vine, than to any other object connected with husbandry. This is now receiving considerable attention through this and other parts of the southern states. Much has been written on this subject, but every year's experience goes to show that none of it is applicable to our locality; on the results of experiment we have to depend for the best method of cultivation and to ascertain what vines are the best varieties for our purpose; they are altogether in favor of our native American grapes. I am much inclined to believe that nearly every foreign kind will in a few years be abandoned, unless cultivated for variety or curiosity. The natives are much the most thrifty, produce the largest quantity of fruit and are least liable to rot; the kinds most easily cultivated, and preferred, are the *Catawba* and *Bland's Madeira*. The *Isabella*, though with us liable to some objections, produces very abundantly in favorable seasons; the *Warrenton* grape succeeds better than any other foreign variety. All these kinds produce a very considerable crop the third season after planting. In a vineyard of that age, last season, I saw three distinct crops on nearly every vine, which appeared to be entirely the result of a proper system of pruning, which was as follows:—At the winter pruning the vines were cut quite low, generally 12 or 15 inches from the ground. After a proper number of shoots had put forth and the fruit had attained the size of a bird-shot, the vine was cut off beyond the third eye from the fruit; from one of these eyes another shoot was allowed to spring, which soon produced fruit; the branch was then cut as at first; a third put out and also produced fruit. Each of these successive crops was generally as large, or nearly so, as the first, and the fruit matured before frost. I doubt whether as many grapes could be produced only in a moist season, which was the case this year; but at such times, it exceeds all calculation. Our Georgia wine appears only to want age to be equal to very good and perhaps the best foreign kinds. It sells by the gallon readily at \$2.50 to \$3.00. You may anticipate that in a few years, many of the hills of the up-country of Georgia will be clad with the vine. There was never a finer country for them or a richer mine of wealth so long neglected.

I see that nearly all the catalogues of nurseries contain an immense number of foreign varieties of the vine. Would it not be much better if it were ascertained what kinds could be best suited to this country, and recommended to such as wish to cultivate them? They are now recommended to the public by high sounding names, and by their productions in their own country; while they are totally unsuited to this. Many persons when they commence cultivating the vine, know very little of the subject and often judge of kinds from these recommendations, and their success not answering their calculations, they became discouraged and abandon the business. This is a fact which I think ought to be impressed on the community, and that the kinds of vine that are ascertained to

succeed well ought to be pointed out under such authority as would recommend it to the confidence of every one. Yours respectfully,
Macon, Ga. Dec. 10, 1831. S. Vose.

BARBERRY BUSHES.

MR FESSENDEN—I see in your last Farmer the remark of one of your intelligent correspondents that the neighborhood of the Wild Cherry Tree is as pestiferous to wheat as that of the Barberry bush. I know it is often stated that the vicinity of Barberry bushes is hurtful to wheat and rye; and it has been so often and confidently repeated that I am disposed to believe there must be a foundation for a prejudice, which is so universal and of such long standing. It is seldom that such axioms obtain general currency and authority without some reason. Still I hold the subject as I would every other not susceptible of mathematical demonstration, as open to inquiry; and I ask therefore what is the proof in this case? For the two last years I have raised spring wheat in the very near vicinity of Barberry bushes without any perceptible injury. The year before the last the crop was very good, being at the rate of twenty-five bushels the acre; the present year much lighter, but this was the case with English grain among us universally. In neither case was there any appearance of blast.

Respectfully yours,
Dec. 15, 1831.

H. C.

Remarks by the Editor.—The *Mass. Agr. Repository*, vol. v. p. 176, contains the following remarks, on the injurious effects of the Barberry bush on wheat and other English grain.

"This opinion, often deemed a prejudice, and by others considered as an unquestionable fact, has lately received the most full and scientific investigation in France. The result of these inquiries, comprised in no less than eighty-four pages of Tessier's *Annals of Agriculture*, seems to settle the question as to the injurious effects of this plant, and that it is pretty uniformly, in France, England, Switzerland and Germany considered, and we may say almost proved, to be one of the causes of blight. We ourselves were perfectly incredulous to this subject, but we are compelled to yield to the weight of proofs.

"It is no longer attributed to the influence or operation of the farina of the flower of the barberry which is over and disseminated several weeks before the several species of grain are in blossom, but it seems to be attributed to a parasitic plant very abundant on the barberry, and which is considered to be the same which causes the rust upon the stalk of wheat. It would be beyond the scope of this journal to give all the evidence on this subject, but we can refer our readers to the work above mentioned; &c.

FOR THE NEW ENGLAND FARMER.

FEEDING STOCK.

The Petersham ox, the beef of which has been recently on sale in the Boston market, was a noble animal, weighing after he was dressed 2019 lbs. The meat to appearance was of the finest description; but I learned with regret from the butcher that the farmer would not get pay for the feed

which the animal had eaten. The price paid by the butcher is not known; but I did not doubt the unfavorable result with the farmer, when I was informed that the animal had consumed within the last thirteen months before he was slaughtered one hundred and forty-four bushels of Indian meal; and this exclusive of other feed.

It is greatly to be desired that our agricultural societies would liberally encourage experiments to determine the value of different kinds of agricultural produce applied to the feeding and fattening of animals, either neat cattle, sheep, or swine; and to the keeping of horses and the rearing of poultry; and likewise the best form of applying this produce, whether in a crude or prepared state; whether long or cut, green or dried, ground or whole, boiled or steamed, simple or mixed. Their premiums certainly could not be better bestowed. They should be sufficiently liberal to compensate the great care and trouble with which experiments, when properly conducted, must be attended; and they should be bestowed upon those experiments, which are made with the greatest intelligence and exactness, whether successful or not, in discovering a profitable mode of employing our produce in this way. In regard to matters of common use but of doubtful expediency or advantage, it is as important to determine by exact experiment what cannot as what can profitably be done. It is a great desideratum in agriculture to discover a mode of applying our produce at home on the farm without loss, so that we may not only preserve but extend the means of increasing its fertility.

Mr Boal, it seems from his recent statement, has ascertained by experiment that he can boil his potatoes for his swine with less expense and trouble than he can steam them and tells us how it is done. This is valuable information. He has carefully tried both modes. I should be glad to know of him if he gives to his swine the water in which his potatoes have been boiled; and if he does, whether he has found any disadvantage from it. Many persons believe it to be poisonous. Curwen, if I remember correctly, for I have not his book at hand, tried its effect upon some of his horses but without any perceptible injury.* Potatoes fed pork is represented by English writers as loose, insipid, weighing light and wasting much in cookery. The inferiority to grain or meal fed pork is stated by an eminent dealer in provisions as equal to three ounces per pound.

Are these mere prejudices, or facts which may be relied on?

* It is possible the following from the *'Farmer's Journal'*, an English Agricultural publication may, in some measure, account for the difference in opinion among cultivators relative to poisonous qualities in the potato. A farmer bought about thirty pigs and immediately put them all up to make pork. Their food was boiled potatoes. In a short time a distemper appeared among them, and about twenty died. The potatoes given to the pigs belonged to a crop of ten acres on light land; and in harvesting them, a great many, which had been long exposed to the sun and weather, were of course, thrown aside for pig food. Potatoes so exposed acquire a poisonous quality, the upper side turning green, and having all the appearance and taste of green coppers. The potatoes in the retail shops in London are much injured by laying long in the light air; so that where the sale is slow they are at least unpalatable and unwholesome.

Parkinson says he has known horses to be killed by feeding on raw potatoes. Raw potatoes have been very successfully applied with us to the fattening of beef animals. Would they be better if boiled or steamed? The Complete Grazier states that the value of vegetables for feeding animals is not always in proportion to the quantity of nutritive matter which they are found by chemical analysis to possess. Of this fact I have been long satisfied. I throw out, Mr Editor, these various hints and suggestions, not with a view to giving any opinion in the case, but merely to know the value of particular and exact experiments in a matter which is of the highest practical importance where opinions are so various, and where at best we are so much in the dark.

H. C.

FOR THE NEW ENGLAND FARMER.

BOTS IN HORSES.

South Boston, Dec. 23d, 1831.

MR FESSENDEN—I have read very attentively the article in your paper of yesterday, copied from the American Farmer, relating to bots in horses. Everything that may throw light upon the subject is important, as this insect has been generally and I must still believe rightly, thought the most formidable enemy to the horse. I feel a deep personal interest in the subject, having lost one valuable horse, I doubt not in the least by a direct attack of the bots, and another, as I firmly believe, by cholice, occasioned by his stomach being disordered originally by the depredations of bots. The last mentioned horse died at a distance from home. I did not see him after he was taken ill and had no opportunity to examine the condition of his stomach. The more remote cause of his death is therefore a matter of conjecture. A case, however, has come under my observation, which I cannot reconcile with the new theory of Mr Harden. To illustrate this case I must first refer to another. In February, 1828, one of the horses above mentioned died, after having been ill about 24 hours. As soon as he could be skinned, I commenced dissection to ascertain the cause of his death. On coming to the stomach I found very many bots, and about two thirds of the inner or villous coat of the stomach entirely eaten away—not eaten through; as the outer or muscular coat remained almost entire. Now if their object had been to make their escape as speedily as possible from the stomach of the dead animal, they would not have passed over so much surface. They might have eaten through in any part, immediately. Now could it have been their object to gorge themselves at last with one desperate meal of flesh. Ten times their number, voracious as they appear to be, could not have devoured so much, in the time that elapsed between the death of the horse and the time of dissection. In fact, they discovered no disposition to leave the maw of the horse. At the lower passage where it appeared to have been thinner they had eaten through in shreds; but had not made their escape. Where most of them were present, they seemed leisurely at work, to satisfy their natural appetite.

I published some remarks upon this case at the time, in the New England Farmer with a reference to the natural history of this insect in the 4th volume of the New England Farmer, page 345, by Doct. Green of Mansfield, a gentleman well known to be one of our most learned entomolo-

gists, uncommonly accurate in his observations and thorough in all his investigations. Dr Green's account should be read by every person at all interested in the subject. If he is correct, as I doubt not he is, bots are not bred, though they may be said to be raised in the bowels of a horse.

The other horse I lost 7 or 8 years ago. He was young, and had been easily kept in good condition. The spring before he died, he perceptibly lost flesh, and discovered symptoms of being troubled with bots.

Through the following summer I had but little and light work for him; yet with much better keeping than usual, I could not hide his ribs. In the autumn, he was seized with cholice, on a short journey, in the hands of an experienced and careful driver, and died before the next morning. His death was caused by a small quantity of corn remaining undigested in his stomach. Taking all the circumstances together and in connexion with my late experience, I have concluded that he had been essentially injured by bots. For I can hardly conceive that double the quantity of corn he had eaten would have injured a horse with a sound stomach.

I have yet to state the case on which I chiefly rely, to prove that bots prey upon the stomach of the living horse, always to his injury in proportion to their ravages, and very often to his destruction, if they are very numerous. In the winter of 1829, a man in my employ kept a horse in my stable. He was seldom used, and put to no hard service. He was not meanly poor when he came, but rather lean. He had what good English hay he would eat, and grain daily. Still to my surprise he seemed to gain no flesh. At length, he was seized with cholice, which caused an entire stoppage in his bowels. We could not remove it by cathartics or clysters. After death I examined his stomach myself, could find only 2 or 3 bots, and those of small size. Yet there was abundant evidence of their former ravages. About two thirds, I should think more, of the inner coat of his maw had been eaten away clean long ago, as was evident by a scarred rim, or head, along the edge of the portion not consumed; showing that nature had been making an ineffectual effort to repair the injury, after the plunderers had finished their brief existence and retired. I may be told it is not absolutely certain this injury was caused by bots. Yet appearances so exactly corresponded to those in the case of my own horse where I found them in the very act, that I have not a doubt upon the subject. If the knife had been applied, as recommended by Mr Harden, this horse might possibly have been relieved, for the time; but never could have been a serviceable beast. His intestines were greatly inflamed, and distended like blown bladders, by the air produced by the fermenting undigested food, that was stowed away in them. Many cases described to me by others, still more confirm me in the belief, that bots do prey upon the stomach of the living horse as their natural food. It did not occur to me in describing the case of my own horse, but I might have added, that I kept many of the bots several days, under various experiments and often applied them to the stomach of the horse after soaking it in warm water. They uniformly seemed at home, firmly applied their hooks and went to work, greedily sucking any blood that flowed from the minute vessels. For many interesting particulars,

relating to this subject, I would again refer to the communication of Dr Green, above mentioned.

The article of Mr Harden contains many valuable hints; but I cannot yet subscribe to his theory. Instead of cholice being the original cause of death to horses, in so many cases as he supposes, I am confident the cholice is much oftener occasioned by the bots feeding upon the stomach, till it is rendered incapable of performing its natural functions. When they leave the horse, having attained their growth, they leave him peculiarly liable to cholice, for his food can never after be well digested, and much of it will pass through him but imperfectly digested, always a pretty certain indication of disease, of an unhealthy or unsound state of the stomach. I will not further extend this article, to comment particularly upon the theory of Mr Harden. The attentive reader will perceive that his facts may easily be accounted for, without adopting his theory. It is very natural, for instance, that bots, when disturbed by dissecting or handling the place of their abode, should endeavor speedily to hide themselves from observation. But this is one thing, and leisurely eating away the inner coat of the stomach, leaving the outer nearly entire, is quite another.

At this season of the year, it may not be amiss to add a few words on the proper mode of treatment for the bots. It is evident they cannot be killed within the horse, without endangering his life. The object therefore is to administer something which they may prefer to feeding upon his stomach, to induce them to let go their fast hold; and then to discharge them as speedily as possible by the most active and powerful cathartics. If a horse is violently attacked, first give him laudanum to reduce the spasms. Bleed freely in the jugular vein. But I think there is danger in bleeding any animal till he falls. Turn down a quart or two of the blood, warm as it flows; or give that quantity of warm milk and molasses; and in a few minutes a powerful dose of castor oil, or other like medicine. Cramming down the entrails of a fowl may be considered a ludicrous prescription, and indeed I should never think of recommending it. Still I have heard of cases so well attested of relief being gained by it that I can easily conceive it to be a rare dainty to the insects, in the failure of their natural food.

Respectfully,

LEMUEL CAPEN.

From the Springfield Whig.

INDIAN CORN.

MR ELDRIDGE—If you think the following worthy of a place in your columns, or of being read by my brother farmers in the valley of the Connecticut, it is at your service. I live out east, as you say in Springfield; but my farm, by good husbandry, produces as good crops, and in as great abundance, as any of the lands in your meadows, under the best possible state of cultivation.

Last spring I ploughed up a piece of green sward, measuring about five acres, and prepared it for corn as well as the means would permit. After ploughing, thirty loads of manure to the acre were spread over the ground and thoroughly mixed with the earth by the harrow, without disturbing or breaking up the sward. The ground being now prepared, on the 30th of May I planted my corn. A small quantity of ashes, lime and plaster of paris, mixed together and prepared for the purpose, was introduced at the time of planting, or put in the hill. Of this mixture or com-

position, there were two and a half bushels of lime, the like quantity of plaster, and twenty-five bushels of ashes for the whole five acres.

The corn was hoed but twice, although a *third hoeing* is usually considered indispensable among good farmers in this part of the country, yet in this case it was unnecessary and impracticable, so rapid and luxuriant was the growth. In ordinary seasons, I should have expected a good crop; the land, though rather light, having been well prepared, according to my views and experience in agriculture. But the crop was enormous and unheard-of in this section of the county, and it is believed seldom equalled in any other. From one acre, being no more than a fair average with the rest, I gathered 153 1-2 bushels of good sound ears of corn. A few baskets have been threshed, which yielded 22 1-2 quarts to the basket making in the whole, from one acre, but a fraction less than 108 bushels of good clean merchantable corn.

Now, 540 bushels of corn from five acres is quite a *corn story* indeed, but *there's no mistake*; it is literally true, and can be verified by a cloud of witnesses. As I have before remarked, the acre taken as the basis of my calculation, was only a fair average with the other four; and the result shows the unprecedented yield of one hundred and eight bushels of corn to the acre. And this, let it be remembered, was upon an old farm *out east*, a section of country better fitted, as the passing traveller might suppose, for white beans than Indian Corn.

Now I challenge any farmer in old Hampshire to give a better account of the works of his own hands, the past season, than I have done. And even *William Cobbett* himself may enter the list, if he so please, provided he appoints an agent here also, to see that there is fair play.

CHARLES BUGBEE.

Palmer, Dec. 3, 1831.

From the New York Advocate.

MASSFIELD, CONN. Nov. 24.

DEAR SIR—The history of any useful art, probably, as important in the records of a nation, as battles and bloodshed; it certainly is more endearing to the philanthropist. The progress in the art of making silk in this country has been tardy in the extreme. It is now above 70 years since Doctor Aspinwall, a native of this town, urged on by patriotism, used his best exertions to introduce the culture of silk. He succeeded in making small commencements at New Haven, on Long Island, and at Philadelphia, by causing orchards of mulberry trees to be planted. He had a warm and useful coadjutor in the Rev. Doctor Stiles, of New Haven. One half of an ounce of mulberry seed was sent to every parish in the state of Connecticut, with such directions as their knowledge of the business enabled them to impart. Through their exertion the legislature in 1783 was induced to grant a bounty on mulberry trees and raw silk. From some cause, which does not appear, the legislature in a few years withdrew the bounty. In 1793 there were raised in this town 265 lbs. of raw silk. It being the residence of Dr Aspinwall, it is presumable, from his well known zeal in the cause, that this result was owing, in some measure, to his superintendence and direction. Let that be as it may, there has been a regular, but slow, progression here ever since.

A short time since a few enterprising individuals united, and have established a small silk factory under the direction of Mr Edward Golding, a regular bred English manufacturer of silk.—They have 32 swifts, for winding hard silk; 32 spindles for doubling; 7 dozen of spindles for throwing; 7 dozen of spindles for spinning; 32 spindles for soft silk winding and 2 broad and 1 fringe silk looms. There is machinery enough prepared sufficient to keep 30 broad silk looms in operation. They have only 11 hands employed at present, but 50 could be employed to advantage. The cocoons are worth three dollars a bushel, and the company have on hand between four and five hundred bushels.

The most perfect of the cocoons are selected for breeding. They will hatch out, usually, in a week, oftentimes in 24 hours. They are exceedingly prolific; a single miller will frequently lay 500 eggs. The eggs when first laid are of a glutinous substance, and adhere to whatever they are deposited on. The usual mode is on sheets of paper. These are preserved in cool dry places, as much out of the air as possible, till the mulberry leaves are sufficiently large for subsistence. As soon as that is the case, they are exposed to a current of warm air, when they soon hatch, and immediately take the leaves. From this time till the cocoon is completed, does not exceed six weeks. As soon as the worms have eaten their fill, small bushes are prepared for them to commence the formation of the cocoon. The commencement is not unlike the first movements of the spider in weaving his web. When the cocoons are completed, all that are not selected for breeding, are either baked or steamed till the worm is dead. All moisture must be extracted from them before they are laid away.

Mulberry trees, to make good silk, should be planted in a rich soil. The larger and more vigorous the tree, the better the silk. It is a common error in supposing that slight and thin leaves will make good silk. The best way to plant an orchard of mulberry trees, is, after selecting a good soil, to plant them 25 feet apart, or about 100 trees the square acre. The larger the tree, the better the silk. When the trees are planted 25 feet apart, there is room for cultivating the land—and such cultivation is esteemed in Mansfield an advantage to the growth of the trees.—40 lbs. of raw silk is considered a fair production from an acre.

From the Keenebec Journal.

A healthy and prosperous Agricultural community necessary to the prosperity of other classes in the community.

I propose to consider a few of the more prominent classes of society and their relation to agriculture, and shall begin with the trader. Without the prosperity of agriculture, traders may sell to a few wandering fishermen and lumbermen: the one promises to pay when he makes a good fare, otherwise it is lost forever—the other, when he sells his lumber; but experience has shown, that before there was considerable farming here lumbering was carried on to so little advantage (being dependent on other States for provisions, &c.) that the sales would but seldom pay the expense; hence the proverb—that lumbering men would lose more than they would make. But let there be a prosperous agricultural community, and the sales are made to substantial and safe men, and the trader

does extensive and safe business, and becomes wealthy accordingly, (if he has the necessary requisites for a trader.) Now, the merchant sells extensively to the trader and he prospers; but when the trader sold to the lumbermen and fishermen, those that can remember forty years back, know it was far otherwise. I myself can remember when retailing goods was the most dangerous business a man could be employed in. But the practice of law and physic was equally embarrassed, and few did or could live by these professions compared with the number now supported among us, even with the present state of agriculture, owing, as I believe, to the improvement of agriculture, although it is far from being what it might be, and what it should be. Mechanics are alike benefited with the classes before mentioned. I might compare the hearers and the preachers of the everlasting gospel with and without a flourishing farming interest; but the above hints go very far in my opinion, to prove that all classes are deeply interested in the prosperity of agriculture among us, for we are a state whose capital is land, and it must be of vital importance, that the best use be made of it. I do think that it has been made to appear that our climate is better calculated for farming purposes, than one far to the south. Where is there a flourishing nation on earth, without a flourishing agricultural interest in the nation? Wherever there is a flourishing agricultural people, there are effective agricultural societies, and without such societies agriculture has never, and probably will never flourish; labor will become, *as here*, disreputable, and agriculture fall in a good measure into disrepute. Youth becomes idle. The professions crowded, and the physical strength of the country seek a living in other parts of the world. Could I make my voice to be heard from York to Washington, I would say, Maine, see to your farming interest as the foundation of all others.

A FARMER.

On the proper Cultivation of the Gooseberry.—When the plants are two years old take them up from the nursery, and trim off all the suckers, and lower branches, leaving only one stem with a few branches at the top. Plant them in a rich light soil in a moist situation, and where they will be partially shaded by branches of trees. In the autumn, cover the ground around them with manure from the cow yard. The latter end of February trim out the branches very much, cutting them off close to the stem, taking out all such as cross each other, but be sure not to shorten the branches, for that causes them to throw out a great deal of wood and very little fruit. In the spring a quantity of young suckers will come up round the stem, all these must be cut off when green, as also any others that grow in the middle of the bush, which must be kept open so as to admit the air freely. It is also a great support to the bush to drive a stake into the ground close to the stem, as keeping it steady causes the fruit to be larger. This treatment is to be continued annually, and the fruit instead of depreciating as is usual, will rather improve in size, as has been proved by some planted 15 or 20 years ago. The ground must be spaded in the spring and kept perfectly clear of weeds.—*American Farmer.*

\$1300 were subscribed in Salem, in two days, to provide fuel for the poor.

ADDRESS,
DELIVERED BEFORE THE WORCESTER
AGRICULTURAL SOCIETY,
OCTOBER 20, 1831.

BEING THEIR THIRTEENTH ANNIVERSARY CATTLE SHOW AND
EXHIBITION OF MANUFACTURES.
BY OLIVER FISKE, M. D.

As the general history of Agriculture may be considered an appropriate subject for the contemplation of an audience, whose object is to improve in its science; and as the avocations of a farmer render it impossible to trace this history through the numerous treatises which have been written on the subject, I doubt not it will be acceptable to devote a few moments to its pleasing retrospect. This course, though in itself of little practical utility, may disclose facts, interesting and useful to the modern farmer. I shall attempt, moreover, in the prosecution of my plan, to render a dry subject more interesting, by occasional irrigations, or by discursive rambles into more enlivening fields. The fair portion of my audience, who may find no attraction in the dull progress of husbandry, in any sense, as derived from history, may enjoy a pleasing abstraction in a mental Episode, while the *Play is in rehearsal*. Let them choose the same period—and for their subject, the same progress from their own degradation, in having been the lowest menials of this employment, to their final emancipation—when lordly man, from civilization and refinement, accorded them the rank intended by their Creator, and surrendered the sceptre. The ore of history is drawn, in its crude state, from the mines. When smelted by the discoverer, and put into circulation as currency, the dealer in such commodity is not to be deemed a purveyor, although 'the image and superscription' on the coin he passes may bear a resemblance to the features, or other peculiarities of the personage who first gave the impress, and stamped its value. This remark may be deemed both pertinent and prudent, where an appropriation from the storerooms of others, which a narrator has occasionally, and from necessity, entered, must be detected in the massy material he withdraws.*

The antiquity of the art of husbandry is, undoubtedly, prior to all other arts. It is coeval with man. The calls of nature, independent of the mandate from Heaven to cultivate the earth, instinctively pointed to this means of relief.

The prodigious length of life which the antediluvians enjoyed, must have been favorable to the advancement of arts and sciences, especially of agriculture. This science, however, seems not to have been much cultivated at this early period: for Noah is the first on record who became a husbandman, and planted a vineyard, though Adam, for centuries, had cultivated a garden. In the days of Abraham, and in some successive ages, men lived in a shepherd state, and subsisted, with their flocks and herds, not so much by cultivating the earth, as by gathering its spontaneous produc-

tions; but, in proportion as population increased, agriculture became necessary.

Different nations have ever been in a different state of civilization; and agriculture, its offspring, has at all times, been in different degrees of improvement among different nations, at the same period. From the earliest accounts of the eastern nations, we have reason to believe that agriculture, in all stages of their civilization, was understood in considerable perfection; for they appear to have been always supplied, not only with the necessities, but with the greatest luxuries of life. High birth, or rank, did not at that time make any distinction; for agriculture was considered as the most honorable employment. Then, as now, the highest classes were in the rank of working men; and the working classes were emulous of their distinction.

It is related of the ancient Persians that their kings, once every month, laid aside their grandeur, like our first magistrates, to eat with husbandmen. In China they did better; instead of eating their substance, their rich repast was in holding their ploughs. This is the highest evidence of the respectable standing, and of their estimation of husbandry.

The precepts of their religion, as taught by their priests, included the practice of agriculture. It was a maxim of the *Zendavesta*, that he who sows the ground with diligence and care, is more acceptable to the gods, and acquires a greater degree of religio is merit than he could have gained by ten thousand prayers.

The Chaldeans, who inhabited the country where agriculture derived its birth, carried this valuable art, to a degree of perfection, bordering on modern improvement. They cultivated their lands with great assiduity, and seem to have discovered some means of restoring fertility to an exhausted soil; for they obtained a succession of plentiful harvests, and consequently, were not under the necessity, as their predecessors had been, of changing their situation for the support of themselves and their numerous flocks and herds. This was a momentous achievement in the art, and is the sound criterion of its highest advancement.

There is no circumstance in the history of man which so forcibly points to the degradation to which he is susceptible, as the fact, that the arts which seem necessary to his existence, are subject to be neglected and lost. Causes which gave them birth, in a measure, cease to operate, and they are forgotten in a removal from the place of their origin.

The children of Noah, who settled in Europe, doubtless carried with them a knowledge of agriculture; but his descendants, who took possession of Greece, were such a savage race, as to subsist upon herbs and roots, in common with the brute. Pelagius taught them the culture of the oak, and the use of acorns as food; for which services divine honors were paid him. After this period, the Athenians taught the use of corn to the rest of the Greeks. They soon perceived that bread was more nutritious, and its taste more palatable, than that of acorns and the wild produce of the field.

The ancient Romans esteemed agriculture so honorable an employment that the most illustrious senators of the empire, in the intervals of public concerns, applied themselves to the profession. On their return from the toils of war, their greatest Generals, as in the oft-cited instance of Cincinnatus, were impatient to be again employed in the peaceful arts of cultivation. Regulus, while trium-

phant in Africa, requested to be recalled lest his farm might suffer from want of cultivation in his absence. To quiet his solicitude, the Government promised that it should be taken care of at the public expense, so long as he should continue to head their armies. Cato, the censor, after having governed extensive provinces and subdued warlike nations, did not think it beneath his dignity to write a treatise on agriculture.

In England, where this art is now advanced to great perfection, little is known of its progress until the 14th century; and not until the beginning of the 16th century was it there taught as a science. At this time Fitzherbert, judge of the Common Pleas, shone forth with distinguished eminence in the practical parts of husbandry. He appears to have been the first Englishman who studied the nature of soils, and the laws of vegetation, with philosophical attention. Many valuable and important improvements have been made in English husbandry, within the last century; and many writers have performed a most essential service, by enlightening the minds of their countrymen, and exciting them to emulation.

About the year 1600, the Flemings became distinguished for the practice of agriculture. Not so much to the fertility of the soil were they indebted for their preeminence, as to the general equality of the inhabitants, their information and industry, but principally to system in all their operations. These combined, gave a productiveness to their labors, never equalled in any other country. 'In Flanders,' says Loudon, 'the gentlemen are all farmers; but the farmers do not all aspire to be gentlemen—and the farm-servants, who are treated with kindness and delicacy, feel the benefit.' Farming was their trade, and their mystery in it they endeavored to keep a secret from the rest of the world. To make a farm, as near as possible, resemble a garden, was their leading idea of good husbandry. Such a correct principle at first setting out, led them of course, to undertake the culture of small estates only, which they kept free from weeds, frequently turning the ground, and manuring it, both plentifully and judiciously. When by this method they had brought the soil to a proper degree of mellowness, purity and health, they chiefly cultivated the most delicate grasses, as the surest means of obtaining a certain profit, from a small estate. A few years' experience was sufficient to teach them, that ten acres of the best vegetables for feeding stock, properly managed, would support a larger number of grazing animals than forty acres of common farm grass on land badly cultivated. The Flemings were the first among the moderns who ploughed in growing crops for the purpose of fertilizing the earth.

At this early period, the art of husbandry had acquired its *angustian age*. The rest of Europe have but lately groped their way to the splendid eminence on which agriculture was placed by this yet unrivalled people. More than two centuries have elapsed in arguments and experiments, to prove and illustrate the doctrines of her simple code. They should be transcribed into the textbook, and become the manual of every farmer as his most perfect guide. These simple elements comprise all that need be known and practised in this long vexed and complicated calling, and will prove the *Philosopher's stone* to those who faithfully follow them.

It will be perceived that the doctrine of rotation of crops, deemed so essential by modern cultivators, was not an ordinance of her enacting; and

* In the announcement of my subject, and in some of the details of its history, I have availed myself of a half sheet manuscript found among my papers, without positive evidence of its originality. But by the advice of friends, most likely to have noticed it had it appeared in the same form elsewhere, I have ventured to embody it. If a stray, I knew not why it came into my inclosure; or should remain there without an appropriate mark; should it be claimed, its use will be considered an ample compensation for its keeping. No one can successfully explore this region of science, without falling into the broad and luminous track of Loudon; and culling from the fruits and flowers he has bountifully strewed by the way side.

I doubt whether it will ever be found essentially necessary, where the Flemish mode of manuring both *plentifully and judiciously*, is duly practised. Under our common mode of cultivation, a farmer is thought to incur a certain hazard of failure who ventures upon two crops of Indian corn, in succession. This is generally true. But for this defect in our staple crop, although an exhausting one, good farmers will find a remedy. It may be raised to any extent where the land is judiciously renovated. The evidence is at hand. The plot of ground in this neighborhood, lately owned by Major Healy, and now, by Samuel M. Burnside, Esq., has to my knowledge, borne corn for more than forty years in succession, without perceptible diminution. Some years since, I had the curiosity to examine an extraordinary field of rye in Berlin, (Conn.) This was a solitary inclosure, at a distance from any cultivated farm. It was waving with a luxuriant crop. I was informed by the Clergyman of the town, who accompanied me, that this grain had been raised in this field, without intermission, for upwards of thirty years; and that by calculation, the straw, closely packed, would be more than sufficient to fill the inclosure to the height of the wall. These are important facts for the contemplation of the agriculturist, although for general use, a change of crops, if not a rotation, may be found the best mode of cultivating his ground.

Flemish husbandry suggests another principle, which I apprehend, is too little regarded by the practical farmer. It is this—the importance of more exclusively conforming the cultivation of a farm to the productions which, under a good state of improvement, and in a marketable region, are best adapted to the soil. The spirit of independence, in a farmer, may work the same evils in his own economy, as are felt by a nation pertinaciously determined to supply every want from her resources. In both cases, sound wisdom and true policy would direct to an interchange of surplus commodities, for such as are required, and which might be obtained for less labor and expense. The farmer, whose land is most adapted to the cultivation of grass, could economically barter the excess with his neighbor, for his surplus of grain. This discriminating mode of cultivation will be more important when a market is found for all the various productions of a farm.

On this head it may be reasonable to remark, that it will be found unprofitable, if not impracticable, to force a crop against the natural impediments of the soil. A recent experiment in the production of hemp will best illustrate my position. Alluvial ground, necessarily mellow, and rich, and free from weeds, is best adapted for its successful cultivation. This soil, thus prepared, is the valuable appendage of but too few of our farms. So rare is this prerequisite, and so worthless the crops without it, that the expense of the *labor of the machinery*, and other necessary means for preparing the article for market, operating upon so limited a scale, must necessarily impose an interdiction to its culture. The experiment is highly commendable, and it is fortunate for the community, in view of the standing of some who have adventured in the project, that its failure has tested the firmness of their nerves, rather than the strength of their hemp.

But I have lingered so long in this enchanting region of Flemish husbandry, prolific in theme and digression—in displaying the blossoms, and

depicting the fruits, which have been reared, and since transplanted as exotics, to other climes, that but little leisure remains for the inquiry, how they have flourished. The residue of our progress must necessarily be more hasty and concise.

[To be continued next week.]

From the New York Farmer.

PUMPKIN BREAD.

MR. FLEET—Sir—As you have in some of your former numbers furnished us with directions for making Rice Bread, Corn Pudding, &c, I presume you will not take it amiss if I call the attention of your readers to the value of the PUMPKIN. I presume there is not a vegetable on the face of earth, more easily raised, or that is more productive; when it is considered that they will grow among corn, potatoes, or on any waste ground, and that the seed of one pumpkin will produce cart loads of fruit.

In the fall of 1829, I obtained the seed of a very superior pumpkin, part of which I planted the latter end of June following, on ground that I had raised two early crops of vegetables from, and comparatively of little value to me at that season of the year. I began to gather some of the fruit in October; it being extraordinary fine, I was anxious to save every grain of the seed, but the difficulty was how to dispose of the flesh or fruit. The common method of making it up into pies, would have been troublesome and expensive, and I thought them to good too feed swine with. I first gave some to my friends, on condition that they would save the seed, but they did not use them up fast enough; at length my wife tried experiments to work them up into Bread, Cakes, Pies, Puddings, &c, and it was not long before we discovered that they could be used so as to answer every purpose as Indian Meal, and that our family and friends considered it preferable to anything of the kind made in the ordinary way.

The pumpkin is first deprived of the rind, and afterwards cut up in slices and boiled; when soft enough it is strained in a colander, and mashed up very fine; in this state it may be used up into pies, or mixed with flour for pudding, cake, &c. If it be intended for bread, it may be made up with wheat flour in the proportion of one third to half. The sponge must be first set in the ordinary way with yeast in the flour, and the pumpkin worked in as it begins to rise. My wife's rule is, to use as many pumpkins as will bring the dough to a proper degree of stiffness without water. Care should be taken that the pumpkin is not too hot to scald the leaven. It requires more baking than bread made entirely of wheat. I am aware that pumpkin bread is nothing new, but I am informed that farmers in the country use Indian meal with their pumpkins instead of wheat flour, which makes it more like pudding than bread. Those farmers that are in the habit of making their bread with wheat and Indian, may find a market for their meal more easily than for pumpkins, and if they use these up into bread precisely in the same manner as they do their meal, I am persuaded they will find it very wholesome and palatable bread.

Yours, respectfully,

T. BRIDGEMAN.

New York, Nov. 21, 1831.

REMARKS.—We have eaten of Mr B's pumpkin bread, and find it very pleasant and superior.—*Ed. Am. Far.*

PLYMOUTH AGRICULTURAL SOCIETY.

At the late annual meeting of the Plymouth County Agricultural Society, Mass.

The committee on farm produce, reported:—

That Abner Washburn 2d, of Bridgewater, is entitled to the premium offered for the best crop of English hay, having raised 8249 1-2 lbs. of well made hay on one acre of land; there being 5862 1-2 lbs. of the first crop, and 3086 lbs. of the second crop. Premium \$10.

He also raised on another acre in the same lot 7192 lbs. well made.

That James L. Otis of Scituate, is entitled to the first premium for the best crop of Rye on one acre; having raised 53 1-2 bushels on one acre and 39 rods of land, which is a fraction over 43 bushels to the acre, \$8 00

That Daniel Gouldard of Plymouth is entitled to the 2d premium for rye having raised 43 bushels on one acre and 7 rods of land, \$6 00

That Salmon Copeland of West Bridgewater is entitled to the premium offered for the greatest quantity of potatoes raised on his farm 1047 bushels, \$10 00

Also to the premium for the best crop of the same article on one acre of land, having so raised 573 bushels, \$8 00

That Thaddeus Howard of W. Bridgewater, is entitled to the premium offered for the greatest quantity of corn on one acre, having so raised 109 bush. and 7 lbs. \$10 00

Drying Peaches.—In a former number of the Farmer, we recommended drying peaches with the skins on, in order to preserve their flavor. We are pleased to find our advice supported by the following useful hints from the Southern Agriculturist.—*Ed. N. Y. Farmer.*

Two years ago, this coming peach time, I made an experiment on a small scale in drying peaches with the skin or paring on, and succeeded better than I expected. I took the kind called open stone, perfectly matured but not too soft, and after rubbing all the scurf or down off with a coarse wet cloth, divided each into halves, filled the cavities with sugar, placed them skin down on a portable scaffold (which is to facilitate their removal) and from their drying place without handling the fruit; by this method the pores are so closed by the skin on one side, and sugar on the other, that the delicious flavor of the peach is retained in a much greater degree than in the common way. Could drying houses, with all the necessary apparatus, be established, there is no calculating the quantity of that kind of fruit which might be dried, and that, too, of a superior quality as respects delicacy and flavor. Proper attention paid to this subject, might make dried peaches as lucrative an article of commerce to our country as figs to Turkey, or raisins to Spain.

Alabama Hemp Growers and Manufacturers.

It is said that some planters in the vicinity of Huntsville, Alabama, are turning their attention to the cultivation of Hemp, and the manufacture of Cotton Bagging and Bale Rope. So far, their prospects are said to be very encouraging, netting them a much greater profit than the growing of Cotton had heretofore done.

Snow fell at Lexington, Kentucky, on the 30th ult to the depth of two or three inches, and there was another snow storm on the 4th instant. The thermometer fell to 4 degrees on the 6th. These facts show that the cold of that region is not much inferior to that of this vicinity.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, DEC. 28, 1831.

☞ We have inclosed bills in this week's paper to most of our subscribers, and we hope those who wish to confer upon us a REAL PATRONAGE, will take into consideration the justice of remitting the amount of their subscription upon the receipt of the bill. Where no private opportunity is likely to occur soon, it may be forwarded by mail. To avoid the inconvenience of sending 50 cents in a letter, a \$3 bill can be inclosed, the balance of which will be passed to the next year's subscription.

A HINT.

MR FESSENDEN.—I saw in your paper of the 14th inst. an article from an English publication, stating that grass, weeds, &c, may be destroyed for years, by watering with a solution of lime and sulphur in boiling water. Now as that is precisely the composition that has been recommended for the prevention of mildew upon grapes, I think we had better pause, and consider, whether, when the earth shall become saturated with the composition we shall not have destroyed the life of the vine at the same time that we are so successful in preventing the disease.

Roxbury, Dec. 19, 1831.

By the Editor.—The old adage, 'what is good for one is poison for another,' applies as well to vegetables as to animals. Some sorts of weeds (the common white weed for instance,) are destroyed by barn-yard manure, or pasturing with sheep, though either of these supply food for useful plants. The mixture of sulphuric acid and lime composes gypsum, alias sulphate of lime, which is known to be a powerful manure. The principal ingredient in sulphuric acid is sulphur, and sulphur in proper quantities is said to be a manure for the grape vine as well as a preservative against insects which infest it. Soils which contain sulphur, such as volcanic districts, &c, produce fine grapes, owing, it is said, to that ingredient. Salt in substance, or strong solution, will destroy weeds; but is said to be friendly to flax, asparagus, &c, when properly applied. Perhaps solutions of sulphur and lime may be made too strong, or applied in too great abundance to vines; but as both substances are manures, (that is food or stimulus to plants,) we should apprehend nothing from their temperate use. Plants as well as animals may be over fed, and injured or destroyed by articles of diet, which, properly furnished, produce salutary effects.

PLANTING PEACH STONES.

A gentleman, a successful cultivator of the peach, states it as his opinion that the principal cause why peach stones so frequently fail of coming up, after having been planted, is to be found in their being planted too deep. He thinks that the seed generally germinates, but if much weight of earth lies on the plum or first shoot, it is not able to force its way to the surface, and of consequence perishes. He says that he has transplanted into his nursery fine plants, produced from stones, which had grown spontaneously under his peach trees. That a good method is to sow them broad cast, in autumn, and harrow them in with a light harrow, and when of suitable size transplant them into a nursery. An inch, or an

inch and a quarter in a light soil, this gentleman supposes is as deep as peach stones should ever be placed in the ground, for the purpose of reproduction.

Sir Humphry Davy remarked that 'It is evident, that in all cases of tillage the seeds should be sown so as to be fully exposed to the influence of the air. And one cause of the unproductiveness of cold, clayed, adhesive soils is, that the seed is coated with matter impermeable to air.'

COCOA-NUT SQUASH.

Extract from a letter from L. Jenkins, Esq. Canandaigua, N. Y. to the Editor of the New England Farmer.

'I would here remark (although I trust the fact may be known to you) that the *cocoa-nut squash* is, in my opinion, one of the most valuable of the family of squashes. I received a few seeds last spring from a friend in New York from which I raised a number; three of the largest weighed nearly 100 lbs. viz. 31½, 34¾, and 24¾ lbs. They have a high color and are of a very rich flavor and make a delicious pie. If they possess the property of keeping a year, as I am informed they do, they must be truly valuable.'

The following statement, taken from the American Turf Register, published in Baltimore, will give a little insight into the profits attending the breeding of turf or blood horses at the South.

SALES OF HORSES.

The appreciation and current value of bred horses may be estimated by the following sales, of very recent date, which have correctly come to our knowledge.

Kate Kearney and Polly Hopkins for	\$4675
One half of Sir Charles,	3000
Medley, (Johnson's) for one half,	4000
refused	
Since sold we have understood for	5000
Annetto, 2 years old, by Sir Charles,	2000
Twice a winner before the sale.	
Andrew, by Sir Charles, 3 years old,	1500
without having won a race.	
Jemima Wilkinson, 3 years old, for	1550
And afterwards for	2500
A winner twice and beaten twice.	
Jama West, 3 years old, by Marion,	1500
twice beaten—never won a race.	
An Arab filly, 3 years old, unbroken,	600
Collier, by Sir Charles, 4 years old,	1500
Sold September last, and has since	
much more than cleared himself to his	
owner, without anything being risked	
but his entrance money.	
Restless, 4 years old, by Virginia,	1750
Twice a winner—since sold for	500
Advance on the purchase money has	
been refused.	
Hayce, by Sir Charles, 4 years old, for	2500
to the Rev. H. M. Cryer, of Tennessee,	
Contention, about, 15 or 16 years old,	
one half of him,	
Champion, 3 years old, by Arab,	1500
beaten once, a winner once.	1000
King Agrippa, by Sir Archy, 3 years	
old, never galloped, for	
to W. R. Johnson, Esq.	1000
Star,	
offered by F. A. Pankey, of Tennessee,	3000
and refused by W. R. Johnson.	
The same gentleman offered	
for Charles—also refused.	5000

Sussex, by Sir Charles, 3000

Note.—The celebrated Paeolet, sire of Monsieur Tonson, was bought at 15 months old, by W. R. Johnson, Esq. for 170 and afterwards sold to General Abatew Jackson, for 3000

It is now and eight years old, he would probably sell for 10,000

Byron, by Virginia, one half for 1500

Snake Fern.—Mr Shaw.—By giving publicity to the following letter from the postmaster at Ross-ville, the object of the writer will be most readily accomplished, viz. to diffuse generally the knowledge of a remedy for a distressing or alarming accident to which all are more or less liable; and the rapidity with which the poison is absorbed, makes it exceedingly desirable that some antidote should be applied before it can be done under the direction of a physician.

The family of Ferns (the first order of the class Cryptogamia) is very numerous. I am not prepared to say that this species may be found abundantly in this vicinity, but presume it may. To the intelligence and respectability of Mr Coopy, all who have acquaintance with him will cheerfully bear testimony.

Yours, respectfully, H. HULL.

Dear Sir,—I herewith inclose you the *Snake Fern* which will cure all kinds of *Snakes' bites*. It has been known to effect a cure when the patient's teeth had to be forced apart. It should be bruised (top and roots) and infused in water or sweet milk (the last is preferable) and taken as the stomach will bear it, till the symptoms subside. I have no doubt but that it would be a valuable medicine in the case of Hydrophobia. I have lived in this nation 28 years and have never known or heard of an Indian being affected with that disease. It is certainly worth a trial. Yours, &c. —[Georgia *Athenium*.] JOSEPH COOPY.

Sheep in Massachusetts.—A correspondent of the *Hingham Gazette*, states the number of Sheep in this state, as contained in returns to the Valuation Committee, to be as follows:

Berkshire,	99,253	Barnstable	10,868
Hampshire	54,714	Middlesex	10,777
Franklin	46,273	Essex	9,200
Worcester	41,160	Nantucket	6,124
Hampden	34,820	Norfolk	3,639
Bristol	17,099	Suffolk	520
Plymouth	15,603		
Dukes	11,692	Total	360,682

From the Kennebec Journal.

MONEY APPLIED BY THIS STATE

To benefit the agricultural interest, the best method of enriching the State.

Other countries and States, with much less land, and not so deeply interested in the welfare of agriculture, have appropriated large sums to the benefit of the farming interest, and are satisfied that the money has been applied to the best purpose. Great Britain has long had her agricultural societies aided by the Government, and it is doubted whether any part of Europe is destitute.

New York has extensive and active agricultural societies; Massachusetts now applies the sum of two hundred dollars yearly to each of her counties (if I am rightly informed) to aid her county societies, and we all know she has a very extensive State society, and has had, for many years; and

lately a Horticultural society is doing much, and Maine has in many cases felt the benefit of their labors in twenty years. The Nova Scotia government have added a very active society in that province, and I have furnished one choice animal for them. Before the establishment of that society they imported bread to a large amount, which importation they say, has been much lessened. Some of the reports of that society have been rich in agricultural matter. They have shown the absurdity of a country situated so far to the north as they are, where they are obliged to fuddle seven months in a year, being obliged to sell butcher's meat and purchase bread stuff; they have shown that the cost of raising a hundred of meat is three times that of a hundred of breadstuff; and yet the meat does not exceed the breadstuff but little in the market. We have yet to learn why all other places are so much benefited by agricultural societies, and have not an object worthy to receive the least legislative aid. Can it be that this State has neglected their true interest? Experience has shown that small premiums are best; but without any it is not believed that one hundred and thirty bushels of good sound corn would have been raised from one acre of ground in the town of Windthrop this year. The information that is obtained from a society cannot be obtained from an individual, nor is the influence in society as great in the one case as in the other. Witness the good done by Temperance Societies of late.

I believe that man labors under a mistake who thinks that we in Maine are situated too far to the north for a good farming country, if the farmer had information, and industry to put it into execution. Teach our youth that we are so situated, and that our soil is indifferent, and they will be sighing after a softer air, and more luxuriant soil; but teach them the contrary, and they will be contented here. A sun sufficient to keep many agricultural societies actively pursuing their object would not be felt in any considerable degree, but the benefit would soon be perceived, and I should hope, acknowledged by every one. A small sun yearly would be sufficient, and much better than a large one at any one time. Can there be any class of people in this state so ignorant of their true interest as to suppose they are not interested in agriculture? In states where they have but little sea-board there is no difficulty in making the Legislatures believe it to be their true interest to patronize agricultural societies. Is it because we have three hundred miles of sea-board that our Legislature has not aided those societies?

If domestic animals are improved; if one hundred bushels of corn are raised where only forty were before the existence of such societies; if domestic and family expenses are lessened; if the people throughout the state are rendered more temperate and industrious, will any man say the state is not enriched thereby? and would not these societies have such a tendency? Commerce and the arts are cultivated by all wise nations; if they are extended too far they beget their evils. Ought we not as a people to do all in our power to elevate the standard of agriculture to its proper level? and can it be better done in any other way than by encouraging agricultural societies? I would call the attention of all elected to the next Legislature to the subject, let their profession or party feelings be what they may. I am satisfied the subject has been too long neglected. There is nothing, that the ingenuity of man may not raise arguments

against, and state abuses of power that never existed. Experience alone can test what premiums are necessary to do good; and the great object of all trustees ought and will be to do good. What other object can they have? I might state such objections as I have heard made, and ingenuity can make more, but I forbear.

A FARMER.

Windthrop, Nov. 1, 1831.

Cobbett's Advice to Young Men, &c.

Just received and for sale at J. B. Russell's Seed Store, No. 50½ North Market street, Boston.

Advice to Young Men, and (incidentally) to Young Women, in the Middle and Higher Ranks of Life; in a series of Letters addressed to a Youth, a Bachelor, a Lover, a Husband, a Citizen, or a subject. By William Cobbett. Price 50 cents.

Also—A Ride of eight hundred miles in France, containing a sketch of the agriculture, &c. of the country. By J. P. Cobbett. Price 30 cents.

Also—Cobbett's Ride through the Netherlands. Price 50 cents.

The Pomological Manual, or a Treatise on Fruits; containing descriptions of a great number of the most valuable varieties for the orchard and garden. By William R. Prince, added by William Prince. Price \$1.00.

One copy only, just received from London, of London's Encyclopedia of Gardening, with many hundred wood engravings; new edition, greatly enlarged and improved. Price \$11.00. Dec. 28.

Seeds for Country Dealers.

Traders in the country, who may wish to keep an assortment of genuine Garden Seeds for sale, are informed they can be furnished at the New England Farmer office, No. 50½ North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as they can be procured in this country, neatly done up in small papers, at 6 and 12 cents each—warranted to be of the growth of 1831, and of the very first quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY and SWEET CORN, &c. of different sorts.

The seeds vended at this establishment, are put up on an improved plan, each package being accompanied with short directions on its management, and packed in the neatest style. Traders are requested to call and examine for themselves. Nov. 12.

Fresh White Mulberry Seed.

Just received at J. B. Russell's Seed Store, Nos. 51 & 52 North Market Street—

A small supply of fresh and genuine White Mulberry Seed, warranted the growth of the present season, from one of the greatest Mulberry orchards in Mansfield, Connecticut. Short directions for its culture accompany the seed.

Tea Wheat.

A few bushels of this very valuable variety of spring Wheat is this day received, for sale at J. B. Russell's Seed Store, No. 50½ North Market street, from the vicinity of Lake Erie. Persons in want of it are advised to call soon, as the supply is small, and many were disappointed in not being able to get the Black Sea Winter Wheat, from the same source. One bushel of this wheat was discovered in a chest of tea in St John, New Brunswick, in 1823, from which the present variety has been discriminated. See N. E. Farmer, vol. ix, page 105—and vol. vi, page 82. Dec. 14.

Grape Vine Cuttings.

Several thousand cuttings of the Catawba, Schuylkill, Muscadell, and Constantia Grape Vines, will be for sale at John Adlum's Georgetown Vineyard, near Washington city, from now till the first of April next. Dec. 21. 3t

Map of New England.

WITH CORRECTIONS TO THE PRESENT TIME.

A few copies of this map, lately printed, with corrections, containing all the new incorporated towns, with the principal roads, &c. are now finished, mounted on rollers, and folded in cases for travellers—and for sale at the Counting Room of the Daily Advertiser, 6 and 8 Congress street, and at the Bookstores. Dec. 21.

Pear Seeds.

For sale at the Seed Store connected with the New England Farmer Office—

One peck of fresh Pear Seeds of excellent quality.

BRIGHTON MARKET—Monday, Dec. 26.

[Reported for the Chronicle and Patriot.]

At market, this day, 735 Beef Cattle, 84 Stores, 900 Sheep, and 680 Swine—about 430 Swine have been before reported.

PRICES.—Beef Cattle.—In consequence of the limited number at market an attempt was made to advance the price—some qualities may have sold higher. Our quotations will be about the same. One yoke were taken at \$5 75, extra 5 25 a 5 50, prime, 5 a 5 12½, good 4 67 a 4 84, thin 3 25 a 4 50.

Barralling Cattle.—Mess 4 12½ a 4 25; No. 1, 5 62½ a 3 75.

Stores and Working Oxen.—But little doing.

Cows and Calves.—Sales were effected at \$19, 21, 22, 24 and 25.

Sheep.—A few sales only were effected—no prices were noticed.

Swine.—Dull, buyers not plenty—a few were retailed at 3 a 4c. for Sows, and 1 a 5c. for Barrows.

New York Cattle Market, Dec. 23.—Beef Cattle—About 400 head of fresh cattle have arrived, making about 800 head in this week, with what were over last—all sold at prices averaging rather better than the last week—we quote \$5 to 6 50, a few very fine sold at \$7. Cows and Calves scarce, and in demand. Sheep and Lambs—About 1000 in, all sold, as well as Beef Cattle, at prices averaging better than last week; Sheep \$3 50 a \$6, Lambs \$3 a 3 50.—Daily Adv.

MISCELLANY.

PUBLIC DOCUMENTS.

The President's Message will be accompanied by Reports from Levi Cass, Secretary of War, Levi Woodbury, Secretary of the Navy, and W. T. Barry, Postmaster General. The Report of Louis McLane, Secretary of the Treasury, has since been transmitted to congress. Some information derived from these documents follows:

The Army.—Mr Cass states that desertion from the army is an evil, which not only continues but increases. The number of desertions in 1826 was 636; in 1829, 1114, and in 1831 will probably amount to 1,450, and make a pecuniary loss to the government of 118,000 dollars. He suggests the expediency of increasing the pay of the non-commissioned officers and privates.

Mr Cass thus notices the effects of ardent spirits in the army:—'A very large proportion of all the crimes committed in the army may be traced to habits of intemperance. This vice is in fact the prevalent one of our soldiery. I am satisfied that ardent spirits should not form a component part of the nation. By issuing it, we furnish to those already accustomed to its use the means of a vicious indulgence, and we invite those who are yet temperate to acquire this destructive habit. There were issued to the army in 1830, 72,537 gallons of whiskey, at the cost of 22,000 dollars. If this sum were applied to the purchase of tea, coffee, and sugar, for the use of the soldiers, their habits and morals would be greatly improved, and the discipline and respectability of the army promoted.'

Mr Cass says that the moral culture of the American soldiers is wholly neglected, and suggests that something should be done to promote their mental and religious improvement.

The Treasury, Public Debt, &c.—The expenditures of the government for 1831 are estimated by Mr McLane at 39,967,201 dollars. Of this sum 16,189,289 dollars have been or will be paid on account of the principal and interest of the public debt, and 14,777,912 dollars for civil list, foreign intercourse, army, fortifications, navy, &c. The receipts into the treasury for 1832 are estimated as follows:

From Customs	26,500,000
Public Lands	3,000,000
Bank Dividends	499,000
Other Receipts	110,000

30,100,000

Of this sum of 30 millions, upwards of 13 millions will be required for the expenditures of 1832 for all objects other than public debt, leaving upwards of 16 millions which may be applied to the public debt.

The public debt on the first of January, 1832, will amount to 24,322,235 dollars; and Mr McLane states that the government has the means of paying the whole debt on or before the 3d of March, 1833. He proposes to sell the 7 millions of stock in the United States Bank; this, with the 16 millions above, and between 2 and 3 millions from revenue of 1833, would extinguish the whole debt.

Mr McLane differs from the President in regard to the National Bank. He recommends the renewal of the charter of this Institution, guarding its future operations by such judicious checks and limitations as experience may have shown to be necessary.

He estimates that the annual expenditures of the government, after the public debt is paid, will not exceed 15 millions of dollars, and recommends such a reduction of the duties on imports, that they will not amount to much over 15 millions. He thinks this may be done, and at the same time a reasonable protection be afforded to domestic industry. He would not at present change materially the duties on wool, woolens, cottons, iron, hemp and sugar, but reduce them gradually in future.

He suggests the expediency of selling all the public lands to the states in whose limits they lie, and of apportioning the avails among the several states of the union.

Post Office Department.—Mr Barry states the expenditures of this department for the year ending July 1, 1831, as follows:

Compensation to post-masters	\$635,029
Transportation of the mail	1,252,226
Incidental expenses	48,304

\$1,935,559

The revenue from postages for the same time amounted to 1,997,811 dollars. On the 1st of July last, there were 8,686 post offices. The annual transportation of the mail by stages and steam boats was 10,728,348 miles, and on horseback and in sulks 4,740,341 miles.—*Hamp. Gazette.*

The Leaves of the Vine are greedily devoured by all cattle, especially the cow, sheep and hog, which are excessively fond of them. They are a great resource during a dearth of fodder. But it should not be forgotten that the wood will not ripen without the leaves; and that they are a great protection against the frost; as well as an essential towards a mature and plentiful crop. They should not be plucked; but, as they fall, should be gathered, heaped in a dry place, or salted and packed hard in barrels. They may be packed alternately with straw or hay, which souks the taste of the leaves and becomes a new delicacy to the cattle.—*Vine Dresser's Manual.*

From the Edinburgh Cabinet Library.

GENERAL ASPECT OF PALESTINE.

The hills still stand round about Jerusalem as they stood in the days of David and of Solomon. The dew falls on Hermon, the cedar grows on Libanus, and Kishon, that ancient river draws its stream from Tabor as in the times of old. The sea of Galilee still presents the same natural accompaniments, the fig-tree springs up by the wayside, the sycamore spreads its branches, and the vines and olives still climb the sides of the mountains. The desolation which covered the cities of the plain is not less striking at the present hour than when Moses with an inspired pen recorded the judgment of God: the swellings of Jordan are not less regular in their rise than when the Hebrews first approached its banks; and he who goes down from Jerusalem to Jericho still incurs the greatest hazard of falling among thieves. There is, in fact, in the scenery and manners of Palestine, a perpetuity that accords well with the everlasting import of historical records, and which enables us to identify with the utmost readiness the local imagery of every great transaction.

COB CIGARS.—A subscriber has handed us for publication the following extract from a letter written by a Pittsburg correspondent:—I find

there are rogues in Kentucky as well as Pennsylvania. A box of *Kentucky Cigars* marked D was a few days since opened in one of our stores, and after taking a course of very fine cigars off the top, the remainder was found transformed into *cob cobs*. A good way of disposing of the whole produce of your cornfield truly. But perhaps the maker may have discovered that *Cob* smoke better than *Tobacco*.

Jewelry, Watches and Fancy Goods.

WM. M. WESSON, No. 105 Washington Street Boston, is constantly supplied with a good assortment of Watches, Silver and Plated Ware, Jewelry, Cutlery, Trays of all kinds, Fancy Goods, &c. &c, which he will give off at as low a rate as can be purchased in the city. All Watches repaired and warranted.

Sir Thomas Browne's Works.

HILLIARD & BROWN, Booksellers to the University, Cambridge, have this day published—The Library of the Old English Prose Writers, Vol. III., containing the Miscellaneous Works of Sir Thomas Browne, with some account of his life and writings. Edited by the Rev. Alexander Young. This volume contains the whole of 'The Religion of a Physician,' treatise on 'Un-Burial,' the Letter to a Friend on the death of his intimate Friend, and selections from the 'Vulgar Errors.'

H. & B. have a few copies remaining of the first and second vols. of this collection, containing Fuller's Holy State, Sibney's Defence of Poesie, and Selden's Table Talk. Each volume may be obtained separately, neatly bound in linen, or elegantly in calf and gilt. Dec. 21.

Flouring Barrels, &c.

Of hard Southern Pine, or Eastern White Pine, furnished to order, ready planed (by steam power) and tongued or grooved, of any required dimensions. Quality good, and price lower than they can be elsewhere had. Apply to E. COPELAND, JR., 65, Broad street.

Cobb's Treatise on Silk.

Just published, and for sale at the Agricultural Warehouse and Seed Store, No. 502 North Market Street. A Manual, containing information respecting the Growth of the Mulberry Tree, with suitable Directions for the Culture of Silk—in three parts—With colored engravings. By J. H. COBB, A. M. Published by direction of His Excellency Gov. Lincoln, agreeably to a Resolve of the Legislature of Massachusetts. Price 37½ cents. Oct. 26.

Ammunition

Of the best quality and lowest prices, for sporting—constantly for sale at COPELAND'S POWDER STORE, 5, Broad Street.

N. B. If the quality is not found satisfactory, it may be returned, and the money will be returned. Jan. 1

Binding.

Subscribers to the New England Farmer are informed that they can have their volumes neatly half bound and lettered, at 75 cts. per volume, by leaving them at the Farmer office. Aug. 3.

Published every Wednesday Evening, at \$3 per annum, (payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents)

[No paper sent to a distance without payment being made in advance.]

NEW ENGLAND FARMER.

PUBLISHED BY J. B. RUSSELL, AT NO. 52 NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE.)—T. G. FESSENDEN, EDITOR.

VOL. X.

BOSTON, WEDNESDAY EVENING, JANUARY 4, 1832.

NO. 25.

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

NATIVE STOCK.

I frequently observe in the perusal of the New England Farmer, statements on cattle, and very uniformly on the late imported breeds, but hardly a solitary notice of our old accustomed breed.—Being a farmer, and having some experience in both breeds, and with strict observation of my neighbors, I am very positive that the true worth of our ancient breed, as to their competition, is much neglected. It is my intention to set forth the true character of both breeds as to their milk, impartially, and within the limits of my knowledge, that the public may be on their guard, and not led away against their interests by any new fanciful representations. In doing this, I shall be fearless of crossing or injuring any individual, and in accordance to this avowal, I am not to lose sight of public interest.

I was not a little pleased with E. C.'s remarks in No. 22, present volume. Had he been fearless of crossing so popular an opinion as now exists in favor of those new and improved breeds, or had he viewed the thing as important as I do, he would have gone on without leave, or request, and described the size and particular properties of the Cow, and made his comparisons generally.—There are in this vicinity some of the large imported breeds of cattle, much larger than the ordinary breed, and they have been frequently exhibited at shows, and have been pronounced very fine, not so frequently the female as the male, and no committee would dare or think of anything less than to encourage such an improvement, apparent to all. They have also been highly recommended by individuals that possessed them, so that a great impulse has been created, and A, B and C have availed themselves of their best means of procuring a heifer, a cow, or a bull, at an extra price, or edged along the most economical way to obtain some of the blood. Among the number I have been one; my first trial was in selecting a heifer from seven others of the same age, going in three years old. She soon brought me a fine calf. The butcher for its fine properties, (especially its name) did not claim it. In the meantime, I was very much put to it to get her milked, all females protesting against going near her long legs, in search for her bag and teats, as they were pretty well concealed, depend on it, and not to be found at all in the usual place in our ordinary breed, but much higher. However my anxiety about milking was soon over; the calf soon took all, and wanted more. I began to alter my opinion of the breed, and disposed of cow and calf. The object of the purchaser was to procure a fine bull calf. I soon heard the cow was good for nothing for milk; she was fed and slaughtered in the fall. Since, the breed has become more frequent; some have fallen into my hands tinctured with this improved blood. I have found them larger, but uniformly less milkers. I have known several of my neighbors to try those cows for milk, who have uniformly condemned them, having fed and

slaughtered them. In this vicinity, if well fed, they weigh from 600 to 1100 lbs.

A friend in an adjacent town has for forty years been improving his breed of cows, and with the greatest attention, like every good farmer. In course his cows are uncommonly large, without the help of the famous improved breed. His cows are noted for producing large stock, but nothing more than common for milk. He has seized the opportunity of crossing with this improved breed. I was at his residence the other day, when, in taking a view of his stock, he pointed out some large heifers, observing he had gone too far, that their legs were too long, their bags were small and high, and that they gave but little milk. He then showed me a bull that he had procured from the country, of a famous breed, reversed, with very short legs, long bodied, thick and round. He confessed his cows were unprofitable, and too long legged, and had taken this method to cut them down, and to improve them. Then showing me two small cows of the old breed, not more than half the size of his, brought there by his tenant, with their bags and teats close to the ground, he asserted that they would produce more than twice the milk of his.

A neighbor has had the curiosity to send to Massachusetts, to a gentleman, for a heifer, who is said to be of the first improved breed in this country. I understand his expense for her was about \$100. She is a show. He was under the necessity of procuring milk immediately for her calf, or it must have starved. He has offered me the heifer, recommending her for calves. I observed to him I was convinced the breed were not good for milk, and that I was improving my breed by going back as fast as possible for the most ancient blood; that it was from them that I derived any profit from my dairy. The milk of this heifer is now present, who is of good reputation, and he says she never gave more than three pints in the height of feed at a milking. I could enumerate numerous similar cases; suffice it to say I know of but few better.

There are but few instances of the old breed of heifers that do not make tolerable cows, to produce in common feed from 7 to 12 quarts of milk, wine measure, at a milking. It has been the case with mine uniformly; and that the smallest heifers make the best and most profitable cows. It is a practice among those deep in the breeding of the improved breed, after proving them, to feed and slaughter the most of them, reserving only the few that will give the most milk. I never have heard in this vicinity with any confidence, of any giving a large quantity of milk, nor any boasting of its quality as being superior; I presume the quality is similar. It is not uncommon that our old ancient breed make seven pounds of butter per week, and the more extraordinary 14, 18 to 20 lbs. From my experience and strict observation, I shall give full credit to the improved breed, to say they give generally half as much as the little docile short legged ancient breed.

Now from my statement it does not show by any means that the improved cows are half the profit of the others. To show their comparative difference, we will suppose a pasture feeds five of

the improved breed well, as it must, or they are good for nothing. My criterion to know how many small ones it takes to feed the same pasture, is to take the same weight; well, that is ten of the small breed. If the five large give 1 quart of milk each at a milking, it is 20 quarts; whereas the ten of the small give 8 quarts each, which is 80 quarts. This is not all the difference. These small cows will do very well with half the feed of the large; then with propriety we will double the number, which is 20, affording 160 quarts. This will operate to keep the pastures from being foul, and cause them to produce sweet feed, successively; whereas by slack feeding, they fast incline to everything but good feed. There is also the same difference in wintering these cows that there is in summering. Now if my statements are correct, it is important; it shows on the one hand that by keeping our beautiful old breed of cows, they give a farmer a fine profit; on the other, we obtain from the improved breed a heavy tax.

A. R.

Portsmouth, (N. H.) Dec. 26, 1831.

NEW FRUITS.

MR FESSENDEN—Your paper of the 27th April noticed the receipt, by the Massachusetts Horticultural Society, of grafts of 18 varieties of foreign apples from Albany, which were distributed among the members. I send you the character of the fruits, as given in Lindley's 'Guide to the Orchard and Kitchen Garden,' one of the most recent and best British Pomological works. The descriptions may be seen under the numbers referred to.—The varieties are mostly new, and of high repute.

1. *Alexander*. 'An excellent and valuable [Russian] fruit.' Fit for the table from October till nearly Christmas. No. 22.
2. *Beauty of Kent*. 'A very excellent fruit.'—An autumnal dessert apple. No. 47.
3. *Blenheim Pippin*. 'Extremely pleasant and high flavored.' In eating from November to March. No. 47.
4. *Beechwood Seedling*. 'An excellent dessert apple from November to April.' No. 67.
5. *Cornish Gillyflower*. 'A very rich dessert apple from November to May. The Lon. Hort. Society awarded a medal in 1813, to a gentleman who brought it into notice; and the *Pom. Magazine* esteems it the best apple grown. No. 130.
6. *Golden Harvey*. 'A most beautiful and excellent dessert apple, ripening in Dec. and keeping till May.' No. 91.
7. *Hatchforden*. 'An excellent culinary fruit from Michaelmas to Christmas.' No. 27.
8. *Kerry Pippin*. 'An excellent dessert apple from Sept. till Nov.' No. 30.
9. *Minshall's Crab*. 'A culinary apple from Nov. till March; and according to London, 'useful for every purpose.' No. 101.
10. *Oslia* (not *Orlin*). 'Ripe about the middle of Aug. and 'very excellent.' No. 6.
11. *Ribston Pippin*. 'May be truly said to be one of the best, and certainly is one of the most popular apples of the present day.' From Oct. to April. No. 155.
12. *Devonshire Quarenden* [Sack]. 'Very much

and very justly esteemed.' Ripe in Aug. and will keep till the last of Sept. No. 8.

13. *Scarlet Nonpareil*. A dessert fruit from Nov. till March. 'It cannot fail of being universally esteemed.' No. 187.

14. *Greenstein*. A German 'dessert apple' ripening in the autumn, but will keep till April, and may be reckoned a rival to our Ribston Pippin. No. 138.

15. *Alfriston*. A very fine and excellent culinary apple—Oct. and till Christmas. No. 46.

16. *Dutchess of Oldenburgh*. A Russian fruit not described by Lindley.

17. *King of the Pippins*. A very beautiful dessert fruit in Nov. and Dec. No. 57.

18. *Dorseton*. A most abundant bearer, extremely well adapted for the market, and an excellent apple for cider.' Ripe in Oct. and keeps till Christmas. No. 50. J. B.

Albany Nursery, Dec. 1831.

FOR THE NEW ENGLAND FARMER.

KNICKERBOCKER PICKLE.

The directions for 'Knickerbocker Pickle,' in which a correspondent some time ago stated that you had put *three fourths* too much molasses, prescribed one *gallon*, instead of one *quart*. As last published it is correct. I have used it some years, for beef and hams, without extra salt; and have now hams, of 20 lbs. weight, more than a year old, thus cured, perfectly sound, and of as fine flavor as those of Burlington or Virginia.

N. B. When the ham is boiled thoroughly, (say 4 hours for one of 16 lbs.) put it immediately from the kettle into a vessel of cold water, which prevents the waste of the juices; and eat it cold.

CHERRY TREES.

MR FESSENDEN—The subject of Mr Tully's letter to Mr Prince, in your paper of 14th December, must be extremely interesting to every one connected with sheep husbandry, and any information which can have a bearing upon the health and thrift of this useful animal, cannot fail of being serviceable to a majority of your readers.—It is probably well known to most farmers, that a 'cherry growth' is almost always consequent upon clearing new lands by fire; at least it is so in this country. These cherries are of a deep red, and have the appearance, and are about the size of the common red currant of our gardens. As they are found on almost every new farm in those parts not yet entirely subdued, it would be of importance to ascertain whether this species of cherry produces the deleterious effects described by Mr Tully. Neither of the gentlemen make any allusion to the kind of sheep affected; and it has occurred to me that *possibly* those of a foreign blood may be more susceptible of injury from this cause than those of our native stocks. I have an island sheep pasture which abounds with the wild red cherry of all sizes; sheep of the native breed have been pastured upon it for the two years last past, and without the slightest apparent injury; and as I wish to place a small flock of the merino breed upon it the next season, I am anxious to obtain some further information on the subject. Should you be in possession of any facts connected with it, I doubt not that many would be benefited by learning them.

I believe a popular notion prevails, (with what reason I do not know,) that it is injurious to year-

ling ewes to browse evergreens, particularly the hemlock, of which they are extremely fond. I have been in the habit of throwing branches of hemlock to my sheep occasionally, and have never perceived any injurious effects. As my experience in this branch of farming is very limited, I should like to know if there is anything to be apprehended from the practice.

Respectfully,

Penobscot Co., Me. 1831.

NOMENCLATURE OF FRUITS.

MR FESSENDEN—The number of English publications on Horticulture and Pomology is so great, that it is often found difficult to make a suitable discrimination, as many of the more ancient and some of the modern English works on this subject contain a mass of error, as well as of facts.

A work has been recently issued from the English press, under the title of 'A Guide to the Orchard and Kitchen Garden,' edited by John Lindley, Assistant Secretary of the London Horticultural Society, which is entitled to more than ordinary consideration; and I would recommend its perusal to all those persons, who are making precision in the nomenclature of fruits an object of investigation.

Another work entitled 'Pyrus Malus Brentfordensis,' with descriptions and plates of near 200 varieties of Apples, has been lately published at London, and is worthy of the highest encomiums. The execution of the engravings surpasses anything of the kind that has ever met my eye, either from France, England, or elsewhere. These two publications taken in connexion with the 'Pomological Magazine,' may be considered as forming a standard nomenclature of the fruits at present cultivated in Great Britain. And although some inadvertencies appear to exist these are amply compensated for by the general accuracy maintained.

I would here respectfully suggest to the proprietors of American Nurseries the formation of *Descriptive Catalogues* of the varieties they respectively cultivate, which can be arranged in the same simple plan as pursued by Mr Lindley, in the work already referred to. By adopting the use of letters, figures, and hieroglyphics, to express general terms as to size, color, quality, &c. a moderate space will suffice to condense all the requisite information. The advantage of such a catalogue to the public cannot fail of imparting mutual and general benefit. Having long had this object in view, I have devoted much attention to the preparation of a Catalogue of this description, which will before long be presented to the public, and distributed gratuitously to all who apply for it.

The continual accumulation of estimable American varieties of fruits, rivaling in many instances the productions of other countries, has been such as not only to arrest the attention of our Pomologists, but to confound those who have entertained the opinion, that perfection in these productions was confined to the eastern hemisphere. The formation of a Catalogue of *American Fruits* exclusively, has been deemed a highly important desideratum, and such an one is nearly ready for publication, and will be also gratuitously distributed.

Very respectfully,

WILLIAM ROBERT PRINCE.

Lin. Bot. Garden,
Flushing, N. Y. Dec. 31.

EFFECTS OF LIME AND SULPHUR.

MR FESSENDEN—Your Roxbury correspondent has no occasion to fear any ill effects from the application of a solution of lime and sulphur in boiling water, to the vine or any plant or shrub, unless the effects should be contrary from what I have experienced in the case of this solution.

Having much yard room and walks to keep in repair, it has been and remains to be a desirable object with me to find some method more easy and less expensive than hoeing, raking and rolling, for preventing the continued growth of grass and weeds. I therefore made early trial last summer of the solution of lime and sulphur as recommended, but found it *increased* rather than checked the growth of grass in my yard.

Now if any of your correspondents will inform me of any method proved by themselves to be effectual in destroying grass and weeds, and preventing their continued growth, easier or less expensive than frequent hoeing, they will incur my warmest obligation.

Brookline, Dec. 30, 1831.

AGRICULTURE IN ENGLAND.

The agriculture of England is confessedly superior to that of any other part of the world, and the condition of those who are engaged in the cultivation of the soil, incontestably preferable to that of the same class in any other section of Europe. An inexhaustible source of admiration and delight is found in the unrivalled beauty, as well as richness and fruitfulness of their husbandry; the effects of which are heightened by the magnificent parks and noble mansions of the opulent proprietors; by picturesque gardens upon the largest scale, and disposed with the most exquisite taste; and by Gothic remains, no less admirable in their structure than venerable for their antiquity. The neat cottage, the substantial farm-house, the splendid villa, are constantly rising to the sight, surrounded by the most choice and poetical attributes of the landscape. The vision is not more delightfully recreated by the rural scenery, than the moral sense is gratified, and the understanding elevated, by the institutions of this great country.

It appears something not less than impious to desire the ruin of this people, when you view the height to which they have carried the comforts, the knowledge, and the virtue of our species; the extent and number of their foundations of charity; their skill in the mechanic arts, by the improvements of which alone they have conferred inestimable benefits on mankind; the masculine morality, the lofty sense of independence, the sober and rational piety which are found in all classes; their impartial, decorous, and able administration of a code of laws, than which none more just and perfect has ever been in operation; their seminaries of education, yielding more solid and profitable instruction than any other whatever; their eminence in literature and science; the urbanity and learning of their privileged orders; their deliberative assemblies, illustrated by so many profound statesmen and brilliant orators.—*Walsk's Travels.*

RURAL LIFE IN ENGLAND.

The taste of the English in the cultivation of the land, and in what is termed landscape gardening, is unrivalled. Nothing can be more imposing than their park scenery. But what most delights me is the creative talent with which the English decorate the unostentatious abodes of middle life.

The rudest habitation, the most unpromising and scanty portion of land, in the hands of an Englishman of taste, becomes a little paradise. The residence of people of fortune and refinement in the country has diffused a degree of taste and elegance in rural economy, that descends to the lowest class. The very laborer, with his thatched cottage and narrow slip of ground, attends to their embellishment. The trim hedge, the grass plot before the door, the little flower bed bordered with snig box, the woodbine trained up against the wall, and hanging its blossoms about the lattice; the pot of flowers in the window; the holly providentially planted about the house, to cheat winter of its dreariness, and throw in a gleam of green summer to cheer the fireside—all these bespeak the influence of taste, flowing down from high sources, and pervading the lowest levels of the public mind. If ever lover, as poets sing, delights to visit a cottage, it must be the cottage of an English peasant.

The proneness to rural life among the higher classes, has had a salutary effect upon the national character. I do not know a finer race of men than the English gentlemen. Instead of the softness and effeminacy which characterize the men of rank in some countries, they exhibit a union of elegance and strength, a robustness of frame and freshness of complexion, which I am inclined to attribute to their living so much in the open air, and pursuing so eagerly the invigorating recreations of the country.

The effect of this devotion of elegant minds to rural occupations has been wonderful on the face of the country. A great part of the island is level, and would be monotonous, were it not for the charms of culture; but it is studded and gemmed, as it were, with castles and palaces, and embowered with parks and gardens. It does not abound in grand and sublime prospects, but rather in little home scenes of rural repose and sheltered quiet. Every antique farm-house and moss-grown cottage is a picture; and as the roads are continually winding, and the view shut in by groves and hedges, the eye is delighted by a continual succession of small landscapes of captivating loveliness.

The great charm, however, of English scenery is the moral feeling that seems to pervade it. It is associated in the mind with ideas of order, of quiet, of calm and settled principles, of hoary usage and reverend custom.

It is a pleasing sight on a Sunday morning, when the bell is sending its sober melody across the quiet fields, to behold the peasantry in their best finery, with ruddy faces, and modest cheerfulness, thronging tranquilly along the green lanes to church; but it is still more pleasing to see them in the evenings, gathering about their cottage doors, and appearing to exult in the humble comforts and embellishments which their own hands have spread around them. It is this sweet home feeling, this settled repose of affection in the domestic scene, that is, after all, the parent of the steadiest virtues and purest enjoyments.

'Oh! friendly to the best pursuits of man,
Friendly to thought, to virtue, and to peace,
Domestic life in rural pleasure passed!'

W. Irving.

Gen. E. Risley, of Fredonia, N. Y. has engaged largely in the manufacture of corn brooms, no less than *thirty thousand* of which he has disposed of to a single house in Buffalo, the present season.

From the Genesee Farmer.

QUINCE TREES.

Last summer two of my quince trees died. I discovered no insects, but suspecting that some hidden depredator had occasioned my loss, I had the trees taken up by the roots and burnt. Two days ago, on digging round some small trees of this kind, I saw a brownish powder on the bark; and on probing with a knife, I found the trees had suffered great damage from worms of an unknown kind. These *larvæ* resemble the peach worm, (*Egeria exitosa*) though rather larger than that worm is commonly found at this season.—They appear to commence near the surface of the ground; and in a great majority of cases, have worked *upward*, sometimes to the height of one foot, gradually slanting through the solid wood, as if they were retiring *inward* on the approach of winter. From one tree I took fifteen worms. It is rare to find two within the same cavity; but the holes are so contiguous that to cut them out would inevitably destroy the tree. I have therefore drawn them out with a barbed wire made sharp.

In a few cases, the worms had worked *downward* slanting *inward*; and in other cases, they remained under the bark without having penetrated the wood. Instead of throwing out their filth like the peach worm, they *pack it behind them*, completely closing the orifice. On breaking through the bark into one of these tracks, the direction of the worm may be determined by the color of the filth, the old part being brown, and the more recent orange colored.

I now suspect that the loss of an English Mulberry which had been two years in a bearing state in my fruit garden, ought to be ascribed to these worms.

Under a microscope they are found to differ from the peach worm in several external particulars, and also in their internal structure. In their manners, the difference is striking; for though the peach worm is occasionally discovered two or more feet from the ground, I have not observed it to work *upward* from the surface; neither does it penetrate the solid wood. It is supposed not to continue in the larvæ state quite a year; but some circumstances rather indicate that the Quince worm may continue longer.

The name of this pernicious insect, and the best method of preventing its ravages, are wanted.

From the Village Record.

LIMING.

In Chester County, Pa. on the farm of Thomas H. B. Jacobs, Esq. of about 150 acres, he has a stone barn 100 feet long, with stabling under the whole, divided in the most convenient manner, for stall feeding, milk-cows, oxen, horses, colts, sheep, &c. It has two threshing floors, one as smooth as any ball room; and here, young and old, at Harvest Home, 'trip it on light fantastic toe,' to 'the sweet sound of the tamboorne and viol.' On the plantation adjoining, belonging to Mr J. B. Remington, there are two new elegant stone barns, the length of the two exceeding 100 feet.

While we boast of our farming, we must repeat again and again, the secret of our prosperity. It is a regular rotation of crops, making a little of many articles, rather than attempting to make much out of one; remembering the Scotch proverb, that 'many a mickle makes a muckle'—

together with heavy liming—*liming—liming*.—Many farms here of an hundred acres have had from 3 to 6000 bushels of lime each, within the last ten years.

We wish the price current makers in all our cities, would state the price of lime per bushel—or if by the cask, mention the number of bushels the casks hold. When the Valley Rail Road shall be completed, Chester County will pour a million of bushels into the city for exportation, if there is a demand abroad; and when Anthracite Coal comes down to its minimum.

From the Genesee Farmer.

SUGAR FROM POTATOES.

The conversion of *starch* into *sugar* has long been known to chemists; and hopes were entertained that some new method of procuring the latter might render the *cane*, the *beet*, and the *maple* of less importance; but years have passed over without any successful attempt in the *large way*, unless that which is mentioned in the following very interesting account from the last number of *Silliman's Journal* should prove to be such. It was written by Samuel Guthrie, of Sackett's Harbor.

'I have been for some time persuaded, taking the data furnished by chemists as correct, that sugar might be advantageously made in towns remote from the Atlantic coast, from the potato; and one year ago, Capt. E. G. Palter, at my instance, with great ingenuity devised and constructed machinery and apparatus for prosecuting the business. As this is the first attempt within my knowledge, to make sugar from that on any considerable scale, I propose giving you a full account of the business so far as it has proceeded. *He has used in the manufacture three thousand five hundred bushels of potatoes.* A fair sample of the sugar, or rather molasses, for no crystallized pure sugar could be obtained, is now sent to you.'

To this account Professor *Silliman* adds, 'The molasses forwarded by Mr Guthrie is very rich, and apparently pure syrup, and has only a slight peculiarity of taste, a little like that of an oil, that could enable one to distinguish it from the best cane molasses. The syrup is nearly as rich as that from the sugar maple: and not improbably may yet afford a crystallized sugar.' D. T.

HATS.—The report of the Committee on the Manufacture of Hats (of which Clarkson Crolius was Chairman, and which was raised at the late Tariff Convention in New York,) is published. It estimates the annual manufacture of hats at \$10,500,000 being exported; that the business employs 18,000 persons, viz.: 15,000 men and boys, 3000 females, whose total wages are computed at \$4,200,000 a year, which is about \$240 for each person; and that the whole number of persons subsisted by the business is from fifty to thirty thousand.

Coffee.—All the coffee grown in the West Indies has sprung from two plants taken thither by a French botanist, from the botanic garden at Paris. On the voyage the supply of water became nearly exhausted; but so anxious was the Frenchman to preserve the plants, that he deprived himself of his allowance in order to water the Coffee Plants. Formerly Coffee could only be got at a great expense from Mocha in Arabia.

ADDRESS,
DELIVERED BEFORE THE WORCESTER
AGRICULTURAL SOCIETY,
OCTOBER 20, 1831,

BEING THEIR THIRTEENTH ANNIVERSARY, CATTLE SHOW AND
EXHIBITION OF MANUFACTURES.
BY OLIVER FISKE, M. D.

Continued from page 129.

The early history of Scotland is productive of few results which give a character to husbandry. The feuds of their clans, and the ignorance and abject condition of the people, retarded, for many centuries, this art of civilization and peace. The labors and publications of Sir John Sinclair, with the efforts of his copatriots in establishing a Board of Husbandry, have infused a spirit which has advanced the practical knowledge and science of agriculture, to a degree of perfection, not surpassed by any portion of the British empire. But the best service rendered by Sir John, was in a residence in Flanders, where he acquired a knowledge of the political economy and agricultural skill of the people, which he has promulgated for the benefit of his own country.

About the middle of the last century, Ireland began to acquire some distinction in the art of husbandry. The transactions of the *Dublin Society* for the encouragement of agriculture, are now cited in terms of approbation by all foreigners, in their memoirs on that subject. She yet sustains her respectable rank. It is known that the generality of this people are miserably poor. Necessity compels the occupants of small patches, rented by their landlords, to resort to the most efficacious measures for their utmost production.—Manure is easily procured, and liberally applied. I once met with a flourishing Irishman, ignorant in most subjects, but intelligent in this, at a place where our scanty mode of manuring was in view. He noticed the different management, in this important particular, between his country and ours. In Ireland he avowed, the piles of manure lay as thick as they can stand; while in this country, one little heap is thrown here, and another, away yonder! Most of our farmers would justify this shrewd remark.

In France, previous to the great revolution which upturned everything but the soil, the science of agriculture was pressed forward with great vigor. Fifteen societies were established by royal approbation and patronage, for their improvement; and twenty co-operating branches aided this national effort. The code of Napoleon was admirably calculated for its advancement, but became paralyzed as soon as enacted, by the downfall of the Corsican. Since that time, France has been too unsettled for improvement.

A few observations on the importance of science, as conducive to the art of husbandry, will bring us to some further view of the rural economy of Great Britain, as introductory to our own.

To prove that science has this important bearing, I need but to mention the fact, that the art of *Printing* gave a perceptible impulse to the art of *Husbandry*. This incontestably demonstrates the importance of *books and treatises* which embody the science, and record the experiments which a detached individual could neither know or conjecture, in the short period allotted for independent improvement. The *Book of Agriculture*, the first and best of all agricultural works, was written by Fitzherbert, already mentioned, and printed in 1534. It obtained an extensive circulation. In diffusing practical knowledge, science

had the benign and salutary influence on the clouded intellect, which the sun imparts in dispelling the darkness, and mists of the morning.—The genial rays of both these heavenly luminaries must be combined, and concentrated, to cause the earth to yield its best increase.

The union of science, and art, in constituting a good farmer, bears an analogy to the soul and body, in forming a perfect man. This union must be derived from the *book-learning*, which, by too many, has been considered wholly superfluous, and its teachings distrustful. This anomalous race, if ever numerous, will soon, I trust, become extinct in this favored region, by the irradiation of that science it labors to obscure. What other art or science is supposed to be attainable, in any considerable degree, without reading or study? Why should the farmer alone rely on *intuition*, the *mere instinct* of the brute, for his improvement; and be directed in his employment, by the same habit which confines his cattle to the furrow, and brings them about at the end of it, without a driver? Why should he consider himself nothing more than the *head tool* of his implements, and but the *main-spring* of their movements, while the mechanic and artisan, by their science, seem to infuse intellect into them? If knowledge be necessary in any occupation, it is pre-eminently so in that of the farmer. The mechanic has no call to investigate the elements which are the bases of the material of his handiwork. His stock is before him; and his tools, guided by the unerring hand, and practical eye of professional skill, give form and finish to his work. Not so in the business of the farmer. He may as readily learn its mechanical parts; but he has problems to solve, and mysteries to investigate. He must be familiar with the component parts of the substance on which he bestows his labor—their relative proportions—their affinities—their separate and compound agencies—and the influence of other bodies, in their adaptation to the results he is laboring to obtain. In short, he must know the *necessary and intimate* connexion between cause and effect. These desirable acquirements, it is true, cannot be found in perfection, except by the aid of chemistry. This important branch of science, in its bearing on agriculture, cannot be obtained by the generality of farmers; nor is it necessary. Their general laws, and principles, are acquired from Lectures on that subject. Something, of which some of you may have seen in the course, which, through the kind instrumentality of the Lyceum, has been recently enjoyed. Their more necessary application to the art of husbandry, may be derived from books, from mental research, and from their daily development. Of the books to be consulted, there is none so appropriate and useful as *Sir Humphry Davy's Elements of Agricultural Chemistry*.

I have said that the profession of agriculture requires more study than that of the artisan. If this be true, it is fortunate for the farmer that he can command more time for its acquisition. Winter is comparatively, and to him more peculiarly, a season of leisure. Those who do not possess books on this subject, can readily borrow them.—Next to the inspired volume, I would lend a treatise on agriculture. But a farmer is the last person who should live by borrowing. Let me recommend a better course—an association of school districts, or smaller sections, for the purchase of a select number of standard works on this subject, with the lighter productions, and periodical

publications of the day. Of this class, none can be more useful than the *New England Farmer*, edited with wise discrimination, and the vehicle of sound and practical instruction, furnished from the experience of our most scientific farmers.

General knowledge, independent of mental enjoyment, is important in all occupations, not only as it may direct the *hand*, but as it calls into exercise other energies, conducive to the common good. This is true under all forms of civil government; more especially in a Republic, where the *forest* is explored, in common with the *grove*, for materials best fitted for the lasting endurance of the edifice. In our favored land, this honorable and patriotic incentive is most happily superadded for its highest attainment.

It is observable in the economy of England, and should be everywhere, that ample provision is to be made for the sustenance of stock, before it becomes an object to multiply, and ameliorate its breed. Having obtained this primary requisite, their great agriculturists, with laudable zeal and perseverance, are prosecuting this next important branch of husbandry.

As evidence that the more imperious wants of society are amply provided for in that country by the aid of husbandry, I mention that Horticulture, or rather its branch of Floriculture, the offspring of luxury, is more prized, and is cultivated with great assiduity. This pet child of dotage, nurtured in refinement, has now become the *belle*, and receives the homage of the day. Her prerogative is to flaunt in the parlor, decked with her *bouquet*, and displaying the *dessert*, while her plain, homely sister in the kitchen, is preparing substantial nutriment for the family, and superintending its necessary concerns. They can best estimate their relative superiority, who have the misfortune to witness the difference between *show* and *substance* in their own households and among their own daughters.

A taste for Horticulture, the primeval employment of man, is pervading and adorning our own country. But this branch of the parent stock must derive her principal rearing and residence from the city and its environs; and when transferred to the country, must yield a precedence to her younger sister. I mean not to derogate from the importance of these fascinating and more refined pursuits, as they occupy the leisure, and serve to cultivate the mind and chasten the taste of the more delicate portion of our race, in an elegant and healthful relaxation; and as they ultimately subserve the interests of agriculture.—They display in miniature, both the theory and practice of good husbandry, which is readily protracted upon a larger scale for the benefit of a country practitioner.

But the rural economy of Great Britain, in her tastes and productions, like her common law, is applicable to us, more from its general principles than its adaptation to the genius of the soil, or the people.—Both, if they govern, must bend to contingencies; and he in force no longer than other codes are established, for the guidance of the farmer and the jurist. Our farmers have indeed found surer guides in their own experiments on their own soil.

It would be instructive, as well as pleasant, to notice the means and the stages of our progress in this most interesting national achievement: but time will permit but a summary view.

The character and success which our first citi-

zens have conferred upon agriculture by their science and personal devotion to its interest, have given an impetus to industry in its multiplied objects and pursuits. All have become ambitious of the denomination of *workers*. The charge of *aristocracy* fabricated by the laboring office seeker, and the busy demagogue, against this class of men, will gain no credence from the intelligent farmer. He witnesses the refutation of the calumny in the fact, that our two first magistrates are at the head of our two first societies of practical workmen; and that other distinguished characters are ardently engaged in cultivating their farms; and are more ambitious of improving their breed of cattle than of accumulating wealth, or any arbitrary distinction for their children.—Surely the elements of aristocracy cannot dangerously predominate in the composition of that man, whose mind can be engrossed, and his eloquence displayed, in portraying the superior merits of his *short horned calves*, or his *Bedford pigs*!

In noticing the means and facilities which have accelerated the art of husbandry, it would be injustice to omit another most general and obvious article in the artisans, by whose ingenuity and skill, the farmer is supplied with his improved implements of husbandry. By their contrivance and workmanship the curse of cultivating the earth by the sweat of the brow, is converted into the blessing of but a *healthful perspiration*.

[Concluded next week.]

ON PEDLARS AND THE TARIFF.

The Tariff has been found fault with for putting a duty of fifteen per cent on tin plates or sheets.—This duty was imposed at a revision of the tariff in which Mr Calhoun, and other southern gentlemen took the lead.

Whatever the motives may have been, it ought in our opinion to be put on the footing of tin in pigs and bars free of duty. But the tin business has fought its way and done well, say the free trade folks, without much aid from government, let all the other branches do the same. A child left to itself, abandoned by its parents, may live, and become a hardy man, perhaps the stronger from neglect but where one survives a hundred would die in the experiment. Our manufacturers of tin ware, by pushing the peddling system with untiring diligence,—carrying their wares into the interior and new settlements where foreign articles could not compete with them, have lived through the trial, and became well established. The comb makers have done the same. What, then, are we to be told that all other branches should go into the peddling business too? If it will hold good with one, it will with others, that is the argument. The shipping interest has thrived under protection, and we hope always may; but suppose the mechanics and manufacturers should turn round upon the merchants, and say, no protection is necessary in your business, the tinner have thrived without it, recall the navy that now at your expense floats a squadron in every sea to protect your ships—give up the monopoly of the coasting trade that you have enjoyed for forty years—pay back the bounties given from the public treasury to your fishing vessels every year—remove the prohibitory duties put, at your own request, upon foreign caught fish,—let foreigners have nearly one half the freighting business which they did have before the protecting hand of the government was extended towards you. These are
